1 DECLARATIVE TYPE SYSTEMS

1.1 Grammar

We assume that there is an infinite set of positive and negative *type* variables. Positive type variables are denoted as α^+ , β^+ , γ^+ , etc. Negative type variables are denoted as α^- , β^- , γ^- , etc. We assume there is an infinite set of *term* variables, which are denoted as x, y, z, etc. A list of objects (variables, types or terms) is denoted by an overline arrow. For instance, α^+ is a list of positive type variables, β^- is a list of negative type variables, γ^- is a list of negative type variables, γ^- is a list of values, which are arguments of a function. γ^- and γ^- is a list of positive type variables in a type γ^- and γ^- respectively.

Definition 1 (Declarative Types).

Negative declarative types

Positive declarative types

$$\begin{array}{ccc} P,\ Q,\ R & ::= & & \\ & \mid & \alpha^+ & \\ & \mid & \downarrow N & \\ & \mid & \exists \overrightarrow{\alpha^+} \cdot P & \end{array}$$

1.2 Equalities

For simplicity, we assume alpha-equivalent terms are equal. This way, we assume that substitutions do not capture bound variables. Besides, we equate $\forall \overrightarrow{\alpha^+}$. $\forall \overrightarrow{\beta^+}$. N with $\forall \overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}$. N, as well as $\exists \overrightarrow{\alpha^-}$. $\exists \overrightarrow{\beta^-}$. P with $\exists \overrightarrow{\alpha^-}$, $\overrightarrow{\beta^-}$. P, and lift these equations transitively and congruently to the whole system.

1.3 Contexts and Well-formedness

Definition 2 (Declarative Type Context).

Declarative type context T is represented by a set of type variables. The concatenation T_1, T_2 means the union of two contexts $T_1 \cup T_2$.

 $T \vdash P$ and $T \vdash N$ denote that the type is well-formed in the context T, which means that each free type variable of the type is contained in T (it will be shown later in lemmas 1 and 2).

Notice that checking the well-formedness of a type is an *algorithmic* procedure, in which both the context and the type are considered inputs. In other words, it is syntax-directed and mode-correct (according to [dunfieldBidirectionalTyping2020]), which means that

Algorithm 1 (Type Well-formedness).

$$\frac{\alpha^{-} \in T}{T \vdash \alpha^{-}} \quad (VAR_{-}^{WF})$$

$$\frac{T \vdash P}{T \vdash \uparrow P} \quad (\uparrow^{WF})$$

$$\frac{T \vdash P \quad T \vdash N}{T \vdash P \rightarrow N} \quad (\rightarrow^{WF})$$

$$\frac{T, \overrightarrow{\alpha^+} \vdash N}{T \vdash \forall \overrightarrow{\alpha^+}, N} \quad (\forall^{WF})$$

186

 $T \vdash P$ Positive type well-formedness

$$\frac{T \vdash N}{T \vdash \downarrow N} \quad (\downarrow^{WF})$$

$$\frac{\alpha^+ \in T}{T \vdash \alpha^+} \quad (VAR_+^{WF})$$

$$\frac{T, \overrightarrow{\alpha^2} + P}{T + \exists \overrightarrow{\alpha^2}, P} \quad (\exists^{WF})$$

1.4 Substitutions

Definition 3 (Substitution). Substitutions (denoted as σ) are represented by total functions from variables to types, preserving the polarity.

Algorithm 2 (Substitution Application). Substitution application is denoted as $[\sigma]P$ and $[\sigma]N$. It is defined naturally as follows:

```
[\sigma]\alpha^+ = \sigma(\alpha^+)
                                                                                                                                      [\sigma](P \to N) = [\sigma]P \to [\sigma]N
                                                                                                                                     [\sigma] \exists \alpha^{\rightarrow}. Q = \exists \alpha^{\rightarrow}. [\sigma] Q

[\sigma] \forall \alpha^{\rightarrow}. N = \forall \alpha^{\rightarrow}. [\sigma] N (assuming the
[\sigma]\alpha^- = \sigma(\alpha^-)
[\sigma] \downarrow N = \downarrow [\sigma] N
[\sigma] \uparrow P = \uparrow [\sigma] P
                                                                                                                                      variable capture never happens)
```

Definition 4 (Substitution Signature). The signature $T' \vdash \sigma : T$ means that

- (1) for any $\alpha^{\pm} \in T, T' \vdash [\sigma] \alpha^{\pm}$; and
- (2) for any $\alpha^{\pm} \notin T'$, $[\sigma] \alpha^{\pm} = \alpha^{\pm}$.

A substitution can be restricted to a set of variables. The restricted substitution is define as expected.

Definition 5 (Substitution Restriction). The specification $\sigma|_{vars}$ is defined as a function such that

- (1) $\sigma|_{vars}(\alpha^{\pm}) = \sigma(\alpha^{\pm})$, if $\alpha^{\pm} \in vars$; and
- (2) $\sigma|_{vars}(\alpha^{\pm}) = \alpha^{\pm}$, if $\alpha^{\pm} \notin vars$.

Two substitutions can be composed in two ways: $\sigma_2 \circ \sigma_1$ corresponds to a consecutive application of σ_1 and σ_2 , while $\sigma_2 \ll \sigma_1$ depends on a signature of σ_1 and modifies σ_1 by applying σ_2 to its results on the domain.

Definition 6 (Substitution Composition). $\sigma_2 \circ \sigma_1$ is defined as a function such that $\sigma_2 \circ \sigma_1(\alpha^{\pm}) =$ $\sigma_2(\sigma_1(\alpha^{\pm})).$

Definition 7 (Monadic Substitution Composition). Suppose that $T' \vdash \sigma_1 : T$. Then we define $\sigma_2 \ll \sigma_1$ $|as(\sigma_2\circ\sigma_1)|_T$.

Notice that the result of $\sigma_2 \ll \sigma_1$ depends on the specification of σ_1 , which is not unique. However, we assume that the used specification clear from the context of the proof.

Definition 8 (Equivalent Substitutions). The substitution equivalence judgement $T' \vdash \sigma_1 \simeq^{\leq} \sigma_2 : T$ indicates that on the domain T, the result of σ_1 and σ_2 are equivalent in context T'. Formally, for any $\alpha^{\pm} \in T, T' \vdash [\sigma_1] \alpha^{\pm} \simeq^{\leqslant} [\sigma_2] \alpha^{\pm}.$

Sometimes it is convenient to construct substitution explicitly mapping each variable from a list (or a set) to a type. Such substitutions are denoted as $\overrightarrow{P}/\overrightarrow{\alpha^+}$ and $\overrightarrow{N}/\overrightarrow{\alpha^-}$, where \overrightarrow{P} and \overrightarrow{N} are lists of the corresponding types.

Definition 9 (Explicit Substitution).

- Suppose that $\overrightarrow{\alpha}$ is a list of negative type variables, and \overrightarrow{N} is a list of negative types of the same length. Then $\overrightarrow{N}/\overrightarrow{\alpha}$ denotes a substitution such that

193

(1) for
$$\alpha_i^+ \in \overrightarrow{\alpha}^-$$
, $[\overrightarrow{N}/\overrightarrow{\alpha}^-]\alpha_i^+ = N_i$;
(2) for $\beta^+ \notin \overrightarrow{\alpha}^-$, $[\overrightarrow{N}/\overrightarrow{\alpha}^-]\beta^+ = \beta^+$.

+ Positive explicit substitution $\overrightarrow{P}/\overrightarrow{\alpha^+}$ is defined symmetrically.

1.5 Declarative Subtyping

Subtyping is one of the key mechanisms of our system. It realizes the polymorphism: abstract ∀ and ∃ types can be used where concrete types are expected, exactly because of the subtyping relation between them.

Definition 10.

The following observations about the declarative subtyping are worth noting:

- (VAR[≤]) and (VAR[≥]) make the subtyping reflexive on variables (and further, on any type).
- (→[≤]) is standard: the arrow is covariant on the resulting type and contravariant on the argument type.
- (↓[>]) and (↑[≤]) are non-standard: the subtyping is *invariant* for shifts. This way, the subtyping of shifted types in one direction implies the subtyping in the opposite direction. Although this rule restricts the subtyping relation, it makes the system decidable.
- (∀[≤]) and (∃[>]) are the only non-algorithmic rules: the substitution for the quantified variable
 is not specified, those, these rules 'drive' the subtyping relation.

In the next section, we present the sound and complete algorithm checking whether one type is a subtype of another according to definition 10.

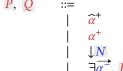

2 ALGORITHMIC TYPE SYSTEM

2.1 Grammar

In the algorithmic system, we extend the grammar of types by adding positive and negative algorithmic variables $(\widehat{\alpha}^+, \widehat{\beta}^+, \widehat{\gamma}^+)$, etc. and $\widehat{\alpha}^-, \widehat{\beta}^-, \widehat{\gamma}^-$, etc.). They represent the unknown types, which will be inferred by the algorithm. This way, we add two base cases to the grammar of positive and negative types and use highlight to denote that the type can potentially contain algorithmic variables.

Definition 11 (Algorithmic Types).

 Positive algorithmic type
P, Q ::=

2.2 Fresh Variable Selection

Both the subtyping and the type inference algorithm rely on the ability to select fresh, unused variables. For a set of variables *vars*, it is indicated as *vars* are fresh in the inference rules. We assume that the selection subroutine always succeeds and is deterministic. In other words, whenever it is called in an algorithmic inference rule, it returns the same result, uniquely determined by the input of this rule.

2.3 Variable Algorithmization

In several places of our algorithm, in particular, during algorithmic subtyping, we turn a declarative type into an algorithmic one via replacing certain type variables with fresh algorithmic variables We call this procedure *variable algorithmization*, and define it as follows.

Definition 12 (Variable Algorithmization). Suppose that $\overrightarrow{\alpha}$ is a list of negative type variables and $\overrightarrow{\alpha}$ is a list of negative algorithmic variables of the same length. Then $\overrightarrow{\alpha}$ / $\overrightarrow{\alpha}$ is a substitution-like procedure replacing each $\alpha_i^- \in \overrightarrow{\alpha}$ in a type for $\widehat{\alpha_i}^- \in \overrightarrow{\widehat{\alpha}}$.

Conversely, we have the opposite procedure turning algorithmic type variables into declarative type variables via *dealgorithmization*.

Definition 13 (Variable Dealgorithmization). Suppose that $\overrightarrow{\alpha}$ is a list of negative algorithmic variables and $\overrightarrow{\alpha}$ is a list of negative type variables of the same length. Then $\overrightarrow{\alpha}$ / $\widehat{\alpha}$ is a substitution-like procedure replacing each $\widehat{\alpha}_i^- \in \overrightarrow{\widehat{\alpha}}$ in a type for $\alpha_i^- \in \overrightarrow{\alpha}$.

2.4 Contexts and Well-formedness

Definition 14 (Algorithmic Type Context Υ).

Algorithmic type context Υ is represented by a set of algorithmic type variables $(\widehat{\alpha}^+, \widehat{\alpha}^-, \widehat{\beta}^+, \dots)$. The concatenation Υ_1, Υ_2 means the union of two contexts $\Upsilon_1 \cup \Upsilon_2$.

T; $\Upsilon \vdash \mathbb{P}$ and T; $\Upsilon \vdash \mathbb{N}$ are used to denote that the algorithmic type is well-formed in the contexts T and Υ , which means that each algorithmic variable of the type is contained in Υ , and each free declarative type variable of the type is contained in T.

Algorithm 3 (Algorithmic Type Well-formedness).

$$T; \Upsilon \vdash N$$
 Negative type well-formedness

$$\frac{\widehat{\alpha}^- \in \Upsilon}{T \; ; \; \Upsilon \vdash \widehat{\alpha}^-} \quad (UVAR_-^{WF})$$

$$\frac{\alpha^- \in T}{T \; ; \; \Upsilon \vdash \alpha^-} \quad (VAR_-^{WF})$$

$$\frac{T : \Upsilon \vdash \mathbf{P}}{T : \Upsilon \vdash \mathbf{P}} \quad (\uparrow^{WF})$$

 $T; \Upsilon \vdash P$

Positive type well-formedness

 $\frac{\alpha^{+} \in T}{T; \Upsilon \vdash P \to N} \quad (\to^{WF})$ $\frac{\alpha^{+} \in T}{T; \Upsilon \vdash \alpha^{+}} \quad (VAR_{+}^{WF})$ $\frac{\alpha^{+} \in \Upsilon}{T; \Upsilon \vdash \alpha^{+}} \quad (UVAR_{+}^{WF})$ $\frac{T, \alpha^{+} : \Upsilon \vdash N}{T; \Upsilon \vdash \forall \alpha^{+} : N} \quad (\forall^{WF})$ $\frac{T, \alpha^{-} : \Upsilon \vdash N}{T; \Upsilon \vdash A} \quad (\exists^{WF})$ $\frac{T, \alpha^{-} : \Upsilon \vdash P}{T \cdot \Upsilon \vdash A} \quad (\exists^{WF})$

Algorithmic Type Context are used in the unification algorithm. In the subtyping algorithm, the context needs to remember additional information. In the subtyping context, each algorithmic variable is associated with a context it must be instantiated in (i.e. the context in which the type replacing the variable must be well-formed). This association is represented by algorithmic subtyping context Σ .

Definition 15 (Algorithmic Subtyping Context Σ).

Algorithmic Subtyping Context Σ is represented by a set of entries of form $\widehat{\alpha}^+\{T\}$ and $\widehat{\alpha}^-\{T\}$, where $\widehat{\alpha}^+$ and $\widehat{\alpha}^-$ are algorithmic variables, and T is a context in which they must be instantiated. We assume that no two entries associating the same variable appear in Σ .

 $\operatorname{dom}(\Sigma)$ denotes the set of variables appearing in Σ : $\operatorname{dom}(\Sigma) = \{\widehat{\alpha}^{\pm} \mid \widehat{\alpha}^{\pm}\{T\} \in \Sigma\}$. If $\widehat{\alpha}^{\pm}\{T\} \in \Sigma$, we denote T as $\Sigma(\widehat{\alpha}^{\pm})$.

2.5 Subsitutions

Substitution that operates on algorithmic type variables is denoted as $\hat{\sigma}$. It is defined as a total function from algorithmic type variables to *declarative* types, preserving the polarity.

The signature $\Sigma \vdash \widehat{\sigma} : \Upsilon$ means that $\Upsilon \subseteq \mathbf{dom}(\Sigma)$ and $\widehat{\sigma}$ maps each algorithmic variable from Υ to a type well-formed in $\Sigma(\widehat{\alpha}^{\pm})$; and for each variable not appearing in $\mathbf{dom}(\Sigma)$, it acts as identity

Definition 16 (Signature of Algorithmic Substitution).

- $\Sigma \vdash \widehat{\sigma} : \Upsilon$ means that
 - (1) for any $\widehat{\alpha}^{\pm} \in \Upsilon$, there exists T such that $\widehat{\alpha}^{\pm} \{T\} \in \Sigma$ and $T \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm}$;
 - (2) for any $\widehat{\alpha}^{\pm} \notin \Upsilon$, $[\widehat{\sigma}]\widehat{\alpha}^{\pm} = \widehat{\alpha}^{\pm}$.
- $T \vdash \widehat{\sigma} : \Upsilon$ means that
 - (1) for any $\widehat{\alpha}^{\pm} \in \Upsilon$, $T \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm}$;
 - (2) for any $\widehat{\alpha}^{\pm} \notin \Upsilon$, $[\widehat{\sigma}]\widehat{\alpha}^{\pm} = \widehat{\alpha}^{\pm}$.

In the anti-unification algorithm, we use another kind of substitution. In contrast to algorithmic substitution $\widehat{\sigma}$, it allows mapping algorithmic variables to *algorithmic* types. Additionally, anti-unification substitution is restricted to the *negative* segment of the language. Anti-unification substitution is denoted as $\widehat{\tau}$ and $\widehat{\rho}$.a

The pair of contexts T and Υ , in which the results of an anti-unification substitution are formed is fixed for this substitution. This way, $T : \Upsilon_2 \vdash \widehat{\tau} : \Upsilon_1$ means that $\widehat{\tau}$ maps each negative algorithmic variable appearing in Υ_1 to a term well-formed in T and Υ_2 .

Definition 17 (Signature of Anti-unification substitution). $T: \Upsilon_2 \vdash \widehat{\tau}: \Upsilon_1$ means that

```

2.6 Equivalence and Normalization

The subtyping-induced equivalence (definition 10) is non-trivial: there are types that are subtypes of each other but not equal. For example, $\forall \alpha^+, \beta^+$. $\alpha^+ \to \uparrow \beta^+$ is a subtype and a supertype of $\forall \alpha^+, \beta^+$. $\beta^+ \to \uparrow \alpha^+$ and of, for example, $\forall \alpha^+, \beta^+$. $\beta^+ \to \uparrow \exists \gamma^-$. α^+ , although these types are not alpha-equivalent. For the subtyping algorithm, it is crucial to be able to check whether two types are equivalent, without checking mutual subtyping. For this purpose we define the normalization procedure, which allows us to uniformly choose the representative type of the equivalence class This way, the equivalence checking is reduced to normalization and equality checking.

For clarification of the proofs and better understanding of the system, we introduce an intermediate relation—declarative equivalence. As will be shown in lemmas 27 and 32, this relation is equivalent to the subtyping-induced equivalence, but does not depend on it. Although this relation is not defined algorithmically, it gives the intuition of what types our system considers equivalent Specifically, in addition to alpha-equivalence, our system allows for reordering of adjacent quantifiers, and introduction/elimination of unused quantifiers.

The non-trivial rules of the declarative equivalence are $(\forall^{\sim D})$ and $(\exists^{\sim D})$. Intuitively, the variable bijection μ reorders the quantifiers before the recursive call on the body of the quantified type. It will be covered formally in section 8.4.

Definition 18 (Declarative Type Equivalence). $N \cong^{D} M$ Negative type equivalence $\overline{\alpha^{-}} \cong^{D} \alpha^{-}$ $\overline{\alpha^{+}} \cong^{D} Q$ $\overline{\alpha^{+}} \cong^{D$

As the equivalence includes arbitrary reordering of quantified variables, the normalization procedure is needed to choose the canonical order. For this purpose, we introduce an auxiliary procedure—variable ordering. Intuitively, **ord** vars in N returns a list of variables from vars in the order they appear in N.

Algorithm 4 (Variable Ordering).

 $\overline{\text{ord } vars \text{ in } N = \overrightarrow{\alpha}} \quad variable \text{ ordering in a negative type}$

$$\frac{\alpha^{-} \in vars}{\operatorname{ord} vars \operatorname{in} \alpha^{-} = \alpha^{-}} \quad (VAR_{-\epsilon}^{ORD})$$

$$\frac{\alpha^{-} \notin vars}{\operatorname{ord} varning} \quad (VAR_{-\epsilon}^{ORD})$$

 $\frac{\text{ord } vars \text{ in } P = \overrightarrow{\alpha}}{\text{ord } vars \text{ in } \uparrow P = \overrightarrow{\alpha}} \quad (\uparrow^{O_{RD}})$ $\frac{\text{ord } vars \text{ in } P = \overrightarrow{\alpha}_1 \quad \text{ord } vars \text{ in } N = \overrightarrow{\alpha}_2}{\text{ord } vars \text{ in } P \to N = \overrightarrow{\alpha}_1, (\overrightarrow{\alpha}_2 \setminus \overrightarrow{\alpha}_1)} \quad (\to^{O_{RD}})$ $\frac{vars \cap \overrightarrow{\alpha^+} = \emptyset \quad \text{ord } vars \text{ in } N = \overrightarrow{\alpha}}{\text{ord } vars \text{ in } \forall \overrightarrow{\alpha^+}. N = \overrightarrow{\alpha}} \quad (\forall^{O_{RD}})$

variable ordering in a positive type

ord vars in $P = \vec{\alpha}$

$$\frac{\alpha^{+} \in vars}{\text{ord } vars \text{ in } \alpha^{+} = \alpha^{+}} \quad (VAR_{+}^{ORD})$$

$$\frac{\alpha^{+} \notin vars}{\text{ord } vars \text{ in } \alpha^{+} = \cdot} \quad (VAR_{+}^{ORD})$$

$$\frac{\text{ord } vars \text{ in } N = \overrightarrow{\alpha}}{\text{ord } vars \text{ in } \sqrt{N} = \overrightarrow{\alpha}} \quad (\downarrow^{ORD})$$

$$\frac{vars \cap \overrightarrow{\alpha^{-}} = \emptyset \quad \text{ord } vars \text{ in } P = \overrightarrow{\alpha}}{\text{ord } vars \text{ in } \exists \overrightarrow{\alpha^{-}} \cdot P = \overrightarrow{\alpha}} \quad (\exists^{ORD})$$

Analogously, the variable can be ordered in an algorithmic type (ord vars in \mathbb{P} and ord vars in \mathbb{N}). In these cases, we treat the algorithmic variables as if they were declarative variables.

Next, we use the variable ordering in the normalization procedure. Specifically, normalization recursively traverses the type, and for each quantified case reorders the quantified variables in a canonical order dictated by algorithm 4, removing unused ones.

Algorithm 5 (Type Normalization). $\boxed{\mathbf{nf}(N) = M}$

$$\frac{\inf(N) = M}{\inf(\alpha^{-}) = \alpha^{-}} (VAR_{-}^{NF}) \qquad \frac{\inf(P) = Q}{\inf(\alpha^{+}) = \alpha^{+}} (VAR_{+}^{NF})
\frac{\inf(P) = Q}{\inf(P) = Q} (\uparrow^{NF})
\frac{\inf(P) = Q \inf(N) = M}{\inf(P \to N) = Q \to M} (\to^{NF})
\frac{\inf(P) = Q \inf(N) = M}{\inf(P \to N) = Q \to M} (\to^{NF})
\frac{\inf(P) = P' \text{ ord } \overrightarrow{\alpha^{+}} \text{ in } P' = \overrightarrow{\alpha^{+}}' \\ \inf(Y\overrightarrow{\alpha^{+}}, N) = Y\overrightarrow{\alpha^{+}}', N'} (Y^{NF}) \qquad \frac{\inf(P) = P' \text{ ord } \overrightarrow{\alpha^{-}} \text{ in } P' = \overrightarrow{\alpha^{-}}'}{\inf(\exists \overrightarrow{\alpha^{-}}, P) = \exists \overrightarrow{\alpha^{-}}', P'} (\exists^{NF})$$

Analogously, we define the normalization of algorithmic types by adding base cases:

 $\frac{\operatorname{nf}(N) = M}{\operatorname{nf}(\widehat{\alpha}^{-}) = \widehat{\alpha}^{-}} \quad (UVAR_{-}^{NF}) \qquad \qquad \frac{\operatorname{nf}(\widehat{\alpha}^{+}) = \widehat{\alpha}^{+}}{\operatorname{nf}(\widehat{\alpha}^{+}) = \widehat{\alpha}^{+}} \quad (UVAR_{+}^{NF})$

Lemma 46 demonstrates that the equivalence of types is the same as the equality of their normal forms.

Theorem (Correctness of Normalization). Assuming the types are well-formed in T,

- T ⊢ $N \simeq M$ if and only if nf(N) = nf(M);
- + $T \vdash P \simeq^{\leq} Q$ if and only if nf(P) = nf(Q).

Algorithm 6 (Substitution Normalization). For a substitution σ , we define $\mathbf{nf}(\sigma)$ as a substitution that maps α^{\pm} into $\mathbf{nf}([\sigma]\alpha^{\pm})$.

The rest of this chapter is devoted to the central algorithm of the type system—the subtyping algorithm. Figure 1 shows the dependency graph of the subtyping algorithm. The nodes represent the algorithmic procedures, and the edge $A \rightarrow B$ means that A uses B as a sub-procedure.

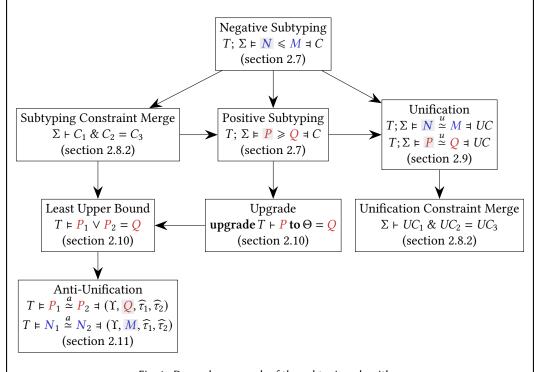

Fig. 1. Dependency graph of the subtyping algorithm

2.7 Subtyping

Now, we present the subtyping algorithm itself. Although the algorithm is presented as a single procedure, is important for the structure of the proof that the positive subtyping algorithm does not invoke the negative one. This way, the correctness of the positive subtyping will be proved independently and used afterwards to prove the correctness of the negative subtyping.

```
Algorithm 7 (Subtyping).
  T; \Sigma \models \mathbb{N} \leqslant M \rightrightarrows C
                                                                                  Negative subtyping
                                                                                                                                     \frac{1}{T: \Sigma \models \alpha^{-} \leq \alpha^{-} \exists \cdot} \quad (VAR_{-}^{\leq})
                                                                                                                       T; \Sigma \models \mathbf{nf} \left( \frac{\mathbf{P}}{\mathbf{P}} \right) \stackrel{u}{\simeq} \mathbf{nf} \left( \mathbf{Q} \right) \dashv UC \uparrow^{\leqslant}
                                                                                                                                   T: \Sigma \models \uparrow P \leqslant \uparrow O = UC
                                                                                              \overrightarrow{\widehat{\alpha}}^{\dagger} are fresh
                                                                                              \frac{T, \overrightarrow{\beta^{+}}; \Sigma, \overrightarrow{\alpha^{+}} \{T, \overrightarrow{\beta^{+}}\} \models [\overrightarrow{\alpha^{+}}/\overrightarrow{\alpha^{+}}] N \leq M \dashv C}{T; \Sigma \models \forall \overrightarrow{\alpha^{+}}. 538 539 The inputs of the subtyping algorithm are the declarative context T, the subtyping context Σ (it specifies in which contexts the algorithmic variables must be instantiated), and the types themselves: N and M for the negative case, and P and Q for the positive case. As one of the invariants, we require M and Q to be declarative (i.e. not containing algorithmic variables). The output of the algorithm is a set of *subtyping constraints* C, which will be discussed in the next section.

Let us overview the inference rules of the subtyping algorithm.

- (VAR[≤]) and (VAR[≥]) are the base cases. They copy the corresponding declarative rules and ensure reflexivity.
- (UVAR[>]) is the only case generating subtyping constraints. In this case, we must ensure that the resulting constraints guarantee that the instantiation of $\widehat{\alpha}^+$ is a supertype of P. However, the obvious constraint $\widehat{\alpha}^+ :> P$ might be problematic if P is not well-formed in $\Sigma(\widehat{\alpha}^+)$. For this reason, we use the *upgrade* procedure (it will be covered in section 2.10) to find the minimal supertype of P, which is well-formed in $\Sigma(\widehat{\alpha}^+)$.

Notice that this rule does not have a negative counterpart. This is because one of the important invariants of the algorithm: in the negative subtyping, only positive algorithmic variables can occur in the types.

- (\downarrow^{\geqslant}) and (\uparrow^{\leqslant}) are the *shift* rules. According to the declarative system, shifted subtyping requires equivalence. In the presence of the algorithmic variables, it means that the left and the right-hand sides of the subtyping must be unified. Hence, the shift rules invoke the unification algorithm, which will be discussed in section 2.9. The unification returns the minimal set of constraints UC, which is necessary and sufficient for the subtyping.
- (→[≤]). In this case, the algorithm makes two calls: a recursive call to the negative subtyping
 algorithm for the argument types, and a call to the positive subtyping algorithm for the
 result types. After that, the resulting constraints are merged using the *subtyping constraint*merge procedure, which is discussed in section 2.8.2.
- (∀[≤]) and (∃[>]) are symmetric. These are the only places where the algorithmic variables are introduced. It is done by algorithmization (section 2.3) of the quantified variables: these variables are replaced by fresh algorithmic variables in the body of the quantified type, the algorithmic variables are added to the subtyping context Σ, after that, the recursive call is made. Notice that the declarative context T is extended by the quantified variables from the right-hand side, which matches the declarative system.

Then soundness lemma (lemmas 78 and 84) and completeness (lemmas 79 and 85) of the algorithm together give us the following simplified theorem:

Theorem (Correctness of subtyping algorithm).

```
- T; · \models N ≤ M \exists · is equivalent to T \vdash N ≤ M; + T; · \models P \geqslant Q \exists · is equivalent to T \vdash P \geqslant Q.
```

2.8 Constraints

Unification and subtyping algorithms are based on constraint generation. The constraints are represented by a set of constraint entries.

Definition 19 (Unification Constraint).

```
unification entry (denoted as ue) is an expression of shape \widehat{\alpha}^+ :\simeq P or \widehat{\alpha}^- :\simeq N; unification constraint (denoted as UC) is a set of unification constraint entries. We denote \{\widehat{\alpha}^{\pm} \mid ue \in UC \text{ restricting } \widehat{\alpha}^{\pm} \} as \mathbf{dom}(UC).
```

However, in the subtyping, we need to consider more general kind of constraints. Specifically, subtyping constraint entries can restrict a variable not only to be equivalent to a certain type, but also to be a supertype of a positive type.

Definition 20 (Subtyping Constraint).

```
subtyping entry (denoted as e) is an expression of shape \widehat{\alpha}^+: \ge P, \widehat{\alpha}^-: \ge N, or \widehat{\alpha}^+: \ge P; subtyping constraint (denoted as C) is a set of subtyping constraint entries. We denote \{\widehat{\alpha}^{\pm} \mid e \in C \text{ restricting } \widehat{\alpha}^{\pm} \} as \mathbf{dom}(C).
```

Definition 21 (Well-formed Constraint Entry). We say that a constraint entry is well-formed in a context T if its associated type is well-formed in T.

```
T \vdash \widehat{\alpha}^+ : \geq P \text{ iff } T \vdash P;

T \vdash \widehat{\alpha}^+ : \simeq P \text{ iff } T \vdash P;

T \vdash \widehat{\alpha}^- : \simeq N \text{ iff } T \vdash N.
```

Definition 22 (Well-formed Constraint). We say that a constraint is well-formed in a subtyping context Σ if all its entries are well-formed in the corresponding elements of Σ . More formally, $\Sigma \vdash C$ holds iff for every $e \in C$, such that e restricts $\widehat{\alpha}^{\pm}$, we have $\Sigma(\widehat{\alpha}^{\pm}) \vdash e$.

```
We write \Sigma \vdash C : \Upsilon to denote that \Sigma \vdash C and \mathbf{dom}(C) = \Upsilon.
```

 $\Sigma \vdash UC$ and $\Sigma \vdash UC : \Upsilon$ are defined analogously.

2.8.1 Constraint Satisfaction. A constraint entry restricts a type that can be assigned to a variable We say that a type satisfies a constraint entry if it can be assigned to the variable restricted by the entry.

Definition 23 (Type Satisfying a Constraint Entry).

 $T \vdash N : e$ Negative entry satisfaction $T \vdash P : e$ Positive entry satisfaction

$$\frac{T \vdash N \cong^{\leq} M}{T \vdash N : (\widehat{\alpha}^{-} :\cong M)} \quad (:\cong_{-}^{SAT})$$

$$\frac{T \vdash P \cong^{\leq} Q}{T \vdash P : (\widehat{\alpha}^{+} :\cong Q)} \quad (:\cong_{+}^{SAT})$$

$$\frac{T \vdash P \cong^{\leq} Q}{T \vdash P : (\widehat{\alpha}^{+} :\cong Q)} \quad (:\cong_{+}^{SAT})$$

We say that a substitution satisfies a constraint—a set of constraint entries if each entry is satisfied by the type assigned to the variable by the substitution.

Definition 24 (Substitution Satisfying a Constraint). We write $\Sigma \vdash \widehat{\sigma} : C$ to denote that a substitution $\widehat{\sigma}$ satisfies a constraint C in a context Σ . It presumes that $\Sigma \vdash C$ and means that for any $ue \in C$, if ue restricts $\widehat{\alpha}^{\pm}$, then $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : ue$.

Unification constraint satisfaction $\Sigma \vdash \widehat{\sigma}$: UC is defined analogously as a special case of subtyping constraint satisfaction.

Notice that $\Sigma \vdash \widehat{\sigma} : C$ does not imply the signature $\Sigma \vdash \widehat{\sigma} : \mathbf{dom}(C)$, because the latter also specifies $\widehat{\sigma}$ outside of the domain $\mathbf{dom}(C)$ (see definition 16).

2.8.2 Constraint Merge. In this section, define the least upper bound for constraints, which we call merge. Intuitively, the merge of two constraints is the least constraint such that any substitution satisfying both constraints satisfies the merge as well. First, we define the merge of entries, and then extend it to the set of entries.

Definition 25 (Matching Entries). We call two unification constraint entries or two subtyping constraint entries matching if they are restricting the same unification variable.

Two matching entries formed in the same context *T* can be merged in the following way:

Algorithm 8 (Merge of Matching Constraint Entries).

 $T \vdash e_1 \& e_2 = e_3$ Subtyping Constraint Entry Merge

$$\begin{split} &T \models P_1 \lor P_2 = Q \\ \hline &T \vdash (\widehat{\alpha}^+ : \geqslant P_1) \& (\widehat{\alpha}^+ : \geqslant P_2) = (\widehat{\alpha}^+ : \geqslant Q) \\ \hline &\frac{T; \; \cdot \models P \geqslant Q \; \exists \; \cdot \\ \hline &T \vdash (\widehat{\alpha}^+ : \simeq P) \& (\widehat{\alpha}^+ : \geqslant Q) = (\widehat{\alpha}^+ : \simeq P) \\ \hline &\frac{T; \; \cdot \models Q \geqslant P \; \exists \; \cdot \\ \hline &T \vdash (\widehat{\alpha}^+ : \geqslant P) \& (\widehat{\alpha}^+ : \simeq Q) = (\widehat{\alpha}^+ : \simeq Q) \\ \hline &\frac{\text{nf} \; (P) = \text{nf} \; (P')}{T \vdash (\widehat{\alpha}^+ : \simeq P) \& (\widehat{\alpha}^+ : \simeq P') = (\widehat{\alpha}^+ : \simeq P)} \end{split} \quad (\geqslant \&^+ \cong)$$

653

14 Anon.

$$\frac{\mathbf{nf}(N) = \mathbf{nf}(N')}{T + (\widehat{\alpha}^{-} :\simeq N) \& (\widehat{\alpha}^{-} :\simeq N') = (\widehat{\alpha}^{-} :\simeq N)} \quad (\simeq \&^{-} \simeq)$$

- ($\simeq \&^+ \simeq$) and ($\simeq \&^- \simeq$) are symmetric cases. To merge two matching entries restricting a variable to be equivalent to certain types, we check that these types are equivalent to each other. To do so, it suffices to check for equality of their normal forms, as discussed in section 2.6. After that, we return the left-hand entry.
- ($\simeq \&^+ \geqslant$) and ($\geqslant \&^+ \simeq$) are also symmetric. In this case, since one of the entries requires the variable to be equal to a type, the resulting entry must also imply that. However, for the soundness, it is needed to ensure that the equating restriction is stronger than the subtyping restriction. For this purpose, the premise invokes the positive subtyping.
- $(\geqslant \&^+ \geqslant)$ In this case, we find the least upper bound of the types from the input restrictions and as the output, restrict the variable to be a supertype of the result. The least upper bound procedure will be discussed in section 2.10.

Unification constraint entries are a special case of subtyping constraint entries. They are merged using the same algorithm (algorithm 8). Notice that the merge of two matching unification constraint entries is a unification constraint entry.

Lemma 1 (Merge of Matching Unification Constraint Entries is well-defined). Suppose that $T \vdash ue_1$ and $T \vdash ue_2$ are unification constraint entries. Then the merge of ue_1 and ue_2 $T \vdash ue_1$ & $ue_2 = ue$ according to algorithm 8, is a unification constraint entry.

Proof. Since ue_1 and ue_2 are matching unification constraint entries, they have the shape $(\widehat{\alpha}^+:\simeq P_1,\widehat{\alpha}^+:\simeq P_2)$ or $(\widehat{\alpha}^-:\simeq N_1,\widehat{\alpha}^-:\simeq N_2)$. Then the merge of ue_1 and ue_2 can only be defined by $(\simeq \&^+\simeq)$ or $(\simeq \&^-\simeq)$. In both cases the result, if it exists, is a unification constraint entry: in the first case, the result has shape $\widehat{\alpha}^+ :\simeq P_1$, in the second case, the result has shape $\widehat{\alpha}^- :\simeq N_1$.

Algorithm 9 (Merge of Subtyping Constraints). Suppose that $\Sigma \vdash C_1$ and $\Sigma \vdash C_2$. Then $\Sigma \vdash C_1 \& C_2 = C$ defines a set of constraints C such that $e \in C$ iff either:

- $e \in C_1$ and there is no matching $e' \in C_2$; or
- $e \in C_2$ and there is no matching $e' \in C_1$; or
- $\Sigma(\widehat{\alpha}^{\pm}) \vdash e_1 \& e_2 = e$ for some $e_1 \in C_1$ and $e_2 \in C_2$ such that e_1 and e_2 both restrict variable $\widehat{\alpha}^{\pm}$

Unification constraints can be considered as a special case of subtyping constraints, and the merge of unification constraints is defined as the merge of subtyping constraints. Then it is easy to see that the merge of two unification constraints is a unification constraint.

Lemma 2 (Merge of Unification Constraints is well-defined). Suppose that $\Sigma \vdash UC_1$ and $\Sigma \vdash UC_2$ are unification constraints. Then the merge of UC_1 and $UC_2 \Sigma \vdash UC_1 \& UC_2 = UC$ according to algorithm 9, is a unification constraint.

PROOF. UC consists of unmatched entries of UC_1 and UC_2 , which are unification constraint entries by assumption, and merge of matching entries, which also are unification constraint entries by lemma 1.

Lemmas 81 and 83 show the correctness and initiality of the merge operation, which can be expressed in the following simplified theorem:

Theorem (Correctness of Constraint Merge). A substitution $\hat{\sigma}$ satisfying both constraints C_1 and C_2 if and only if it satisfies their merge.

680 681

682

683

The unification constraint merge satisfies the same theorem, however, because the merge of unification constraint entries ue_1 and ue_2 always results in one of them, a stronger soundness property holds (see lemma 61):

Theorem (Soundness of Unification Constraint Merge). *If* $\Sigma \vdash UC_1 \& UC_2 = UC$ *then* $UC = UC_1 \cup UC_2$.

2.9 Unification

 The subtyping algorithm calls the following subtask: given two algorithmic types, we need to find the most general substitution for the algorithmic variables in these types, such that the resulting types are equivalent. This problem is known as *unification*.

In our case, the unification is restricted in the following way: first, before unifying the types, we normalize them, which allows us to reduce (non-trivial) equivalence to (trivial) equality; second, we preserve invariants which guarantee that one side of the unification is always declarative, which in fact, reduces the unification to the *matching* problem.

The unification procedure returns a set of minimal constraints, that must be satisfied by a substitution unifying the input types.

Algorithm 10 (Unification).

$$T; \Sigma \models N \stackrel{u}{\simeq} M \dashv UC \qquad Negative unification$$

$$T; \Sigma \models R \stackrel{u}{\simeq} Q \dashv UC \qquad T; \Sigma \models R \stackrel{u}{\simeq} R \dashv UC \qquad T; \Sigma \models R \stackrel{u}{\simeq} R$$

- $(\uparrow^{\stackrel{\omega}{\sim}}), (\downarrow^{\stackrel{\omega}{\sim}}), (\forall^{\stackrel{\omega}{\sim}}), \text{ and } (\exists^{\stackrel{\omega}{\sim}})$ are defined congruently. In the shift rules, the algorithm removes the outermost constructor. In the \forall and \exists rules, it removes the quantifiers, adding the quantified variables to the context T. Notice that Σ , which specifies the contexts in which the algorithmic variables must be instantiated, is not changed.
- (VAR_) and (VAR_) are the base cases. Since the sides are equal and free from algorithmic variables, the unification returns an empty constraint.
- $(VAR_{-}^{\frac{u}{2}})$ and $(VAR_{+}^{\frac{u}{2}})$ are symmetric cases constructing the constraints. When an algorithmic variable is unified with a type, we must check that the type is well-formed in the required context, and if it is, we return a constraint restricting the variable to be equivalent to that type.
- $(\rightarrow^{\frac{\pi}{2}})$. In this case, the algorithm makes two recursive calls: it unifies the arguments and the results of the arrows. After that, the resulting constraints are merged using the *unification*

16 Anon.

constraint merge procedure, which is discussed in section 2.8.2. Notice that UC_1 and UC_2 are guaranteed to be *unification* constraints, not arbitrary *subtyping* constraints: it is important for modularizing the proofs, since the properties of the *unification* constraint merge can be proved independently from the *subtyping* constraint merge.

2.10 Least Upper Bound

In this section, we present the algorithm finding the least common supertype of two positive types It is used directly by the constraint merge procedure (section 2.8.2), and indirectly, through the type upgrade by positive subtyping (section 2.7). Perhaps, the least upper bound is the least intuitive part of the algorithm, and its correctness will be covered in section 9.8.

Algorithm 11 (The Least Upper Bound Algorithm).

 $T \models P_1 \lor P_2 = Q$ Least Upper Bound

$$\frac{T, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{-}} \models P_{1} \lor P_{2} = Q}{T \models \exists \overrightarrow{\alpha^{-}}. P_{1} \lor \exists \overrightarrow{\beta^{-}}. P_{2} = Q} \qquad (\exists^{\vee})$$

$$\frac{T \models \alpha^{+} \lor \alpha^{+} = \alpha^{+}}{T \models \inf(\downarrow N) \stackrel{a}{\simeq} \inf(\downarrow M) \exists (\Upsilon, P, \widehat{\tau}_{1}, \widehat{\tau}_{2})}$$

$$\frac{T \models \eta f(\downarrow N) \stackrel{a}{\simeq} \inf(\downarrow M) \exists (\Upsilon, P, \widehat{\tau}_{1}, \widehat{\tau}_{2})}{T \models \downarrow N \lor \downarrow M = \exists \overrightarrow{\alpha^{-}}. [\overrightarrow{\alpha^{-}}/\Upsilon] P} \qquad (\downarrow^{\vee})$$

- (VAR^V) The base case is trivial: the least upper bound of to equal variables is the variable itself.
- (\downarrow^{\vee}) In case both sides of the least upper bound are shifted, the algorithm needs to find the anti-unifier of them. Intuitively, this is because in general, the upper bounds of $\downarrow N$ are $\exists \overrightarrow{\alpha}$. P such that $\overrightarrow{\alpha}$ can be instantiated with some \overrightarrow{M} so that $T \vdash [\overrightarrow{M}/\overrightarrow{\alpha}]P \simeq^{<} \downarrow N$ (see lemma 69).
- (\exists^{\vee}) In this case, we move the quantified variables to the context T, and make a recursive call. It is important to make sure that $\overrightarrow{\alpha}$ and $\overrightarrow{\beta}$ are disjoint. In this case, it is guaranteed that the resulting fv(Q) will be free of $\overrightarrow{\alpha}$ and $\overrightarrow{\beta}$, and thus, the resulting type will be a supertype of both sides (it will be discussed in lemma 69).

In the positive subtyping algorithm (section 2.7), (UVAR $^{\geqslant}$) generates a restriction of a variable $\widehat{\alpha}^+$ On the one hand, this restriction must imply $\widehat{\alpha}^+$: $\geqslant P$ for the subtyping to hold. On the other hand, the type used in this restriction must be well-formed in a potentially stronger (smaller) context than P.

To resolve this problem, we define the *upgrade* procedure, which for given Θ , $\overrightarrow{\alpha^{\pm}}$, and Θ , $\overrightarrow{\alpha^{\pm}} \vdash P$ finds $\Theta \vdash Q$ —the least supertype of P among the types well-formed in Θ .

The trick is to make sure that the 'forbidden' variables $\alpha^{\frac{2}{4}}$ are not used explicitly in the supertypes of P. For this purpose, we construct new types P_1 and P_2 , in each of them replacing the forbidden variables with fresh variables $\overrightarrow{\beta^{\pm}}$ and $\overrightarrow{\gamma^{\pm}}$, and then find the least upper bound of P_1 and P_2 . It turns out that this renaming forces the common types of P_1 and P_2 to be agnostic to $\alpha^{\frac{1}{2}}$, and thus, the supertypes of P well-formed in Θ are exactly the common supertypes of P_1 and P_2 . These properties are considered in more details in section 9.9.

Algorithm 12 (Type Upgrade). upgrade $T \vdash P$ to $\Theta = \bigcirc$ Type Upgrade

$$T = \Theta, \overrightarrow{\alpha^{\pm}}$$

$$\overrightarrow{\beta^{\pm}} \text{ are fresh } \overrightarrow{\gamma^{\pm}} \text{ are fresh }$$

$$\Theta, \overrightarrow{\beta^{\pm}}, \overrightarrow{\gamma^{\pm}} \models [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}] P \vee [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}] P = Q$$

$$\text{upgrade } T \vdash P \text{ to } \Theta = Q$$

$$(U_{PG})$$

Note on the Greatest Lower Bound. In contrast to the least upper bound, the general greatest lower bound does not exist in our system. For instance, consider a positive type P, together with its non-equivalent supertypes P_1 and $P_2 \neq P_1$ (for example, $P = \downarrow \uparrow \downarrow \gamma^-$, $P_1 = \exists \alpha^-$. $\downarrow \uparrow \downarrow \alpha^-$, and $P_2 = \exists \alpha^-$. $\downarrow \alpha^-$). Then for arbitrary Q and N, let us consider the common subtypes of $A = Q \rightarrow \downarrow \uparrow Q \rightarrow \downarrow \uparrow Q \rightarrow N$ and $B = P \rightarrow \downarrow \uparrow P_1 \rightarrow \downarrow \uparrow P_2 \rightarrow N$. It is easy to see that $\forall \alpha^+$. $\forall \beta^+$. $\alpha^+ \rightarrow \downarrow \uparrow \alpha^+ \rightarrow \downarrow \uparrow \alpha^+ \rightarrow N$ are both maximal common subtypes of A and B, and since they are not equivalent, none of them is the greatest one.

However, we designed the subtyping system in such a way that the greatest lower bound is not needed: the negative variables are always 'protected' by *invariant* shifts (\uparrow and \downarrow), and thus, the algorithm can only require a substitution of a negative variable to be *equivalent* to some type but never to be a *subtype*.

2.11 Anti-unification

 Next, we define the anti-unification procedure, also known as the *most specific generalization*. As an input, it takes two declarative types (e.g., in the positive case P_1 and P_2) and a context T. and returns a type Q—the generalizer, containing negative placeholders (represented by algorithmic variables) from Υ and two substitutions $\widehat{\tau}_1$ and $\widehat{\tau}_2$. The substitutions replace the placeholders with declarative types well-formed in T, such that $[\widehat{\tau}_1]Q = P_1$ and $[\widehat{\tau}_2]Q = P_2$. Moreover, the algorithm guarantees that Q is the most specific type with this property: any other generalizer can be turned into Q by some substitution $\widehat{\rho}$.

It is important to note the differences between the standard anti-unification and our version First, we only allow the placeholders at *negative* positions, which means, for example, that α^+ and β^+ cannot be generalized. Second, the generated pair of substitutions $\hat{\tau}_1$ and $\hat{\tau}_2$ must replace the placeholders with types well-formed in a specified context T.

The anti-unification algorithm assumes that the input types are normalized. This way, antiunification up-to-equality rather than anti-unification up-to-equivalence is sufficient.

Algorithm 13 (Anti-unification).

$$T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$$

$$\frac{T \models \alpha^+ \stackrel{a}{\simeq} \alpha^+ = (\cdot, \alpha^+, \cdot, \cdot)}{T \models \lambda_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)} \qquad (VaR_+^{\frac{a}{\simeq}})$$

$$\frac{T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)}{T \models \lambda_1 \stackrel{a}{\simeq} \lambda_2 = (\Upsilon, \lambda_1, \widehat{\tau}_2)} \qquad (\downarrow^{\frac{a}{\simeq}})$$

$$\frac{\overrightarrow{\alpha} \cap T = \emptyset \quad T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)}{T \models \exists \overrightarrow{\alpha} \cdot P_1 \stackrel{a}{\simeq} \exists \overrightarrow{\alpha} \cdot P_2 = (\Upsilon, \exists \overrightarrow{\alpha} \cdot Q, \widehat{\tau}_1, \widehat{\tau}_2)} \qquad (\exists^{\frac{a}{\simeq}})$$

$$T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$$

 $\frac{T \models R^{-\frac{a}{\cong}} \alpha^{-} \dashv (\cdot, \alpha^{-}, \cdot, \cdot)}{T \models P_{1} \stackrel{a}{\cong} P_{2} \dashv (\Upsilon, Q, \widehat{\tau}_{1}, \widehat{\tau}_{2})} \qquad (\uparrow^{\frac{a}{\cong}})$ $\frac{T \models P_{1} \stackrel{a}{\cong} P_{2} \dashv (\Upsilon, Q, \widehat{\tau}_{1}, \widehat{\tau}_{2})}{T \models \uparrow P_{1} \stackrel{a}{\cong} \uparrow P_{2} \dashv (\Upsilon, \uparrow Q, \widehat{\tau}_{1}, \widehat{\tau}_{2})} \qquad (\uparrow^{\frac{a}{\cong}})$ $\frac{\overrightarrow{\alpha^{+}} \cap T = \emptyset \qquad T \models N_{1} \stackrel{a}{\cong} N_{2} \dashv (\Upsilon, M, \widehat{\tau}_{1}, \widehat{\tau}_{2})}{T \models \forall \overrightarrow{\alpha^{+}} N_{1} \stackrel{a}{\cong} \forall \overrightarrow{\alpha^{+}} N_{2} \dashv (\Upsilon, \forall \overrightarrow{\alpha^{+}}, M, \widehat{\tau}_{1}, \widehat{\tau}_{2})} \qquad (\forall^{\frac{a}{\cong}})$ $\frac{T \models P_{1} \stackrel{a}{\cong} P_{2} \dashv (\Upsilon_{1}, Q, \widehat{\tau}_{1}, \widehat{\tau}_{2}) \qquad T \models N_{1} \stackrel{a}{\cong} N_{2} \dashv (\Upsilon_{2}, M, \widehat{\tau}_{1}', \widehat{\tau}_{2}')}{T \models P_{1} \rightarrow N_{1} \stackrel{a}{\cong} P_{2} \rightarrow N_{2} \dashv (\Upsilon_{1} \cup \Upsilon_{2}, Q \rightarrow M, \widehat{\tau}_{1} \cup \widehat{\tau}_{1}', \widehat{\tau}_{2} \cup \widehat{\tau}_{2}')} \qquad (\rightarrow^{\frac{a}{\cong}})$ $\stackrel{if other rules are not applicable}{T \models N \qquad T \vdash M} \qquad (AU)$ $T \models N \stackrel{a}{\cong} M \dashv (\widehat{\alpha}_{\{N,M\}}^{-}, \widehat{\alpha}_{\{N,M\}}^{-}, (\widehat{\alpha}_{\{N,M\}}^{-} \mapsto N), (\widehat{\alpha}_{\{N,M\}}^{-} \mapsto M))$

- $(VAR_{+}^{\frac{\alpha}{2}})$ and $(VAR_{-}^{\frac{\alpha}{2}})$ are the base cases. In this case, since the input types are equal, the algorithm returns this type as a generalizer, without generating any placeholders.
- $(\downarrow^{\stackrel{a}{\sim}}), (\uparrow^{\stackrel{a}{\sim}}), (\forall^{\stackrel{a}{\sim}})$, and $(\exists^{\stackrel{a}{\sim}})$ are defined congruently. In the shift rules, the algorithm removes the outermost constructor. In the \forall and \exists rules, it removes the quantifiers. Notice that the algorithm does not add the removed variables to the context T. This is because T is used to restrict the resulting anti-unification substitutions, and is fixed throughout the algorithm.
- (AU) is the most important rule, since it generates the placeholders. This rule only applies
 if other negative rules failed. Because of that, the anti-unification procedure is not syntaxdirected.
 - The generated placeholder is indexed with a pair of types it is mapped to. It allows the algorithm to automatically unite the anti-unification solutions generated by the different branches of $(\rightarrow^{\stackrel{\alpha}{=}})$.
 - Notice that this rule does not have a positive counterpart, since we only allow negative placeholders.
- $(\to^{\stackrel{a}{\simeq}})$ makes two recursive calls to the anti-unification procedure, and unites the results Suppose that $\widehat{\tau}_1$ and $\widehat{\tau}_2$ are the substitutions generated by anti-unification of *argument* types of the arrow, and $\widehat{\tau}_1'$ and $\widehat{\tau}_2'$ are the substitutions generated by anti-unification of *result* types of the arrow. It is important that if $(\widehat{\tau}_1, \widehat{\tau}_2)$ and $(\widehat{\tau}_1', \widehat{\tau}_2')$ send some variables to the same pair of types, i.e., $[\widehat{\tau}_1]\widehat{\alpha}^- = [\widehat{\tau}_1']\widehat{\beta}^-$ and $[\widehat{\tau}_2]\widehat{\alpha}^- = [\widehat{\tau}_2']\widehat{\beta}^-$, then these variables are equal, i.e., $\widehat{\alpha}^- = \widehat{\beta}^-$. This property is guaranteed by (AU): the name of the placeholder is determined by the pair of types it is mapped to.

3 DECLARATIVE TYPING

In the previous section, we presented the type system together with subtyping specification and the algorithm. In this section, we describe the language under this type system, together with the type inference specification and algorithm.

3.1 Grammar

First, we define the syntax of the language. The language combines System F with call-by-push-value style.

Definition 26 (Language Grammar).

```
Computation Terms

c, d ::= v, w ::=
```

Notice that the language does not have first-class applications: instead, we use applicative let bindings— constructions that bind a result of a fully applied function to a (positive) variable. In the call-by-push-value paradigm, it corresponds to monadic bind or do-notation. Typewise, these let-binders come in two forms: annotated and unannotated. The annotated let-binders let $x : P = v(\vec{v})$; c requires the application to infer the annotated P, whereas the unannotated let $x = v(\vec{v})$; c is used when the inferred type is unique.

A computation of a polymorphic type is constructed using $\Lambda \alpha^+$. c, however, the elimination of \forall is implicit. Conversely, the existential types are constructed implicitly and eliminated using the standard unpack mechanism: $\det^{\exists}(\overrightarrow{\alpha}, x) = v$; c.

Another dual pair of constructions are **return** v and $\{c\}$. The former allows us to embed a value in pure computations. The latter, on the contrary, encapsulates a thunk of computation in a value Finally, the language has several standard constructions: lambda-abstractions $\lambda x : P$. c, standard let-bindings let x = v; c, and type annotations that can be added to any value or computation (v : P) and (c : N).

3.2 Declarative Type Inference

Next, we define the specification of the type inference for our language. First, we introduce variable context specifying the types of variables in the scope of the current rule.

Definition 27 (Variable Context). The variable typing context Γ is represented by a set of entries of the form x : P.

The specification is represented by an inference system of three mutually recursive judgments: positive inference $T; \Gamma \vdash \nu : P$, negative type inference $T; \Gamma \vdash c : N$, and application type inference $T; \Gamma \vdash N \bullet \overrightarrow{v} \implies M$. In the premises, the inference rules also refer to the declarative subtyping (definition 10), type well-formedness (algorithm 1), and normalization (algorithm 5).

• T; $\Gamma \vdash v$: P (and symmetrically, T; $\Gamma \vdash c$: N) means that under the type context T and the variable context Γ , for the value v, type P is inferrable. It guarantees that v is well-formed in T and Γ in the standard sense.

• $T : \Gamma \vdash N \bullet \overrightarrow{v} \implies M$ is the application type inference judgment. It means that if a head of type N is applied to list of values \overrightarrow{v} , then the resulting computation can be typed as M.

Definition 28 (Declarative Type Inference). $T; \Gamma \vdash c : N$ *Negative typing*

$$\frac{T \vdash P \quad T; \Gamma, x : P \vdash c : N}{T; \Gamma \vdash \lambda x : P \cdot c : P \to N} \quad (\lambda^{INF})$$

$$\frac{T}{T; \Gamma \vdash \lambda x : P \cdot c : N} \quad (\Lambda^{INF})$$

$$\frac{T}{T; \Gamma \vdash \Lambda \alpha^{+} \cdot c : \forall \alpha^{+} \cdot N} \quad (\Lambda^{INF})$$

$$\frac{T}{T; \Gamma \vdash \Lambda \alpha^{+} \cdot c : \forall \alpha^{+} \cdot N} \quad (\Lambda^{INF})$$

$$\frac{T}{T; \Gamma \vdash \nu : P} \quad (RET^{INF})$$

$$\frac{T}{T; \Gamma \vdash \nu : P} \quad T; \Gamma, x : P \vdash c : N$$

$$T; \Gamma \vdash \text{let } x = v : c : N$$

$$T; \Gamma \vdash \text{let } x = v : c : N$$

$$T; \Gamma \vdash \text{let } x = v : c : N$$

$$T; \Gamma \vdash N \bullet \overrightarrow{v} \Rightarrow \uparrow Q \text{ unique}$$

$$T; \Gamma, x : Q \vdash c : N$$

$$T; \Gamma \vdash \text{let } x = v(\overrightarrow{v}) : c : N$$

$$(LET^{INF})$$

$$T; \Gamma \vdash c : N \quad T \vdash N \leq M$$

$$T; \Gamma \vdash c : N \quad T \vdash N \leq M$$

$$T; \Gamma \vdash c : N \quad T \vdash N \leq N'$$

$$T; \Gamma \vdash c : N'$$

$$T; \Gamma \vdash c : N'$$

$$T; \Gamma \vdash c : N'$$

 $T; \Gamma \vdash \nu : P$ Positive typing

$$\frac{x:P\in\Gamma}{T;\Gamma\vdash x:P} \quad (VAR^{INF}) \qquad \qquad \frac{T\vdash Q \quad T;\Gamma\vdash v:P \quad T\vdash Q\geqslant P}{T;\Gamma\vdash (v:Q):Q} \quad (ANN_{+}^{INF})$$

$$\frac{T;\Gamma\vdash c:N}{T;\Gamma\vdash \{c\}:N} \quad (\{\}^{INF}) \qquad \qquad \frac{T;\Gamma\vdash v:P \quad T\vdash P\simeq^{\leqslant}P'}{T;\Gamma\vdash v:P'} \quad (\simeq_{+}^{INF})$$

 $T : \Gamma \vdash N \bullet \overrightarrow{v} \implies M$ Application typing

$$\frac{T \vdash N \simeq^{\leqslant} N'}{T ; \Gamma \vdash N \bullet \cdot \Longrightarrow N'} \quad (\emptyset_{\bullet \Longrightarrow}^{INF})$$

$$T ; \Gamma \vdash \nu : P \quad T \vdash Q \geqslant P$$

$$T ; \Gamma \vdash N \bullet \overrightarrow{v} \Longrightarrow M$$

$$T ; \Gamma \vdash Q \to N \bullet v, \overrightarrow{v} \Longrightarrow M$$

$$(\hookrightarrow_{\bullet \Longrightarrow}^{INF})$$

$$T ; \Gamma \vdash Q \to N \bullet v, \overrightarrow{v} \Longrightarrow M$$

$$(\hookrightarrow_{\bullet \Longrightarrow}^{INF})$$

Let us discuss the selected rules of the declarative system:

• (VAR^{INF}) says that the type of a variable is inferred from the context.

• ({}^{INF}) says that the type of a thunk is inferred by shifting up the type of the contained computation. Symmetrically, (RET^{INF}) infers the type of a return by shifting down the type of the contained value.

- (ANN^{INF}₊) and (ANN^{INF}₋) are symmetric. They allow the inferred type to be refined by annotating it with a supertype.
- $(\simeq_{-}^{\text{INF}})$ and $(\simeq_{+}^{\text{INF}})$ mean that the declarative system allows us to infer any type from the equivalence class.
- (LET_\(\frac{\text{INF}}{\text{J}}\)) is standard for existential types, and its first premise infers the existential type of the value being unpacked. It is important however that the inferred existential type is normalized. This is because there might be multiple equivalent existential types with a different order or even number of quantified variables, and to bind them, the algorithm needs to fix the canonical one.
- (LET_{:@}^{INF}) allows us to accommodate the applications with annotated let-bindings. The first premise infers the type of the head of the application, which must be a thunked computation Then if after applying it to the arguments, the resulting type can be equated to the annotated one, we infer the body of the let-binding in the context extended with the bound variable.
- (LET_@) is similar to (LET_:@), but it is used when the type of the application is unique, and thus, the annotation is redundant. Here $T : \Gamma \vdash M \bullet \overrightarrow{v} \implies \uparrow Q$ unique means that if also $T : \Gamma \vdash M \bullet \overrightarrow{v} \implies \uparrow Q'$ then $T \vdash Q \simeq^{\leqslant} Q'$

Let us discuss the rules of the application inference:

- $(\emptyset_{\bullet \Rightarrow}^{\text{INF}})$ is the base case. If the list of arguments is empty, the inferred type is the type of the head. However, we relax this specification by allowing it to infer any other equivalent type. The relaxation of this rule is enough to guarantee this property for the whole judgement: if $T : \Gamma \vdash N \bullet \overrightarrow{v} \implies M$ then $T : \Gamma \vdash N \bullet \overrightarrow{v} \implies M'$ for any equivalent M'.
- $(\rightarrow_{\bullet \Rightarrow}^{\text{INF}})$ is where the application type is inferred: if the head has an arrow type $Q \to N$, we are allowed to apply it as soon as as soon as the first argument has a type, which is a subtype of Q.
- $(\forall_{\bullet \Longrightarrow}^{\text{INF}})$ is the rule ensuring the implicit elimination of the universal quantifiers. If we are applying a polymorphic computation, we can instantiate its quantified variables with any types, which is expressed by the substitution $T \vdash \sigma : \overrightarrow{\alpha}^{+}$.

4 ALGORITHMIC TYPING

 Next, we present the type inference algorithm, which is sound and complete with respect to the declarative specification (definition 28).

4.1 Algorithmic Type Inference

Mirroring the declarative typing, the algorithm is represented by an inference system of three mutually recursive judgments:

- $T; \Gamma \models v : P$ and $T; \Gamma \models c : N$ are the algorithmic versions of $T; \Gamma \vdash v : P$ and $T; \Gamma \vdash c : N$. In contrast with the declarative counterparts, they are deterministic, and guarantee that the inferred type is normalized.
- T; Γ ; $\Sigma_1 \models N$ $\overrightarrow{v} \implies M \dashv \Sigma_2$; C is the algorithmization of T; $\Gamma \vdash N$ $\overrightarrow{v} \implies M$. Notice that N contains algorithmic variables, which are specified by the context Σ_1 . Moreover, the inferred type M is also algorithmic, and can have several non-equivalent instantiations To accommodate that, the algorithm also returns Σ_2 and C specifying the variables used in M: Σ_2 defines the contexts in which the variables must be instantiated, and C imposes restrictions on the variables.

Vol. 1, No. 1, Article Publication date: November 2023.

As subroutines, the algorithm calls subtyping (algorithm 7), type well-formedness (algorithm 1) constraint merge (section 2.8.2), normalization (algorithm 5), and constraint singularity which will be defined later in section 4.2. It also relies on basic set operations and the ability to deterministically choose fresh variables.

Algorithm 14.

 $T; \Gamma \models v : P$ Positive typing

$$\frac{x: P \in \Gamma}{T; \Gamma \models x: \mathbf{nf}(P)} \quad (VAR^{INF}) \qquad \frac{T \vdash Q \quad T; \Gamma \models v: P}{T; \Gamma \models (v: Q) : \mathbf{nf}(Q)} \quad \frac{T; \Gamma \models c: N}{T; \Gamma \models \{c\}: \downarrow N} \quad (\{\}^{INF})$$

 $T; \Gamma \models c : N$ Negative typing

$$T \vdash M \quad T; \Gamma \models c : N$$

$$T; \vdash N \leqslant M \dashv \cdot$$

$$T; \Gamma \models (c : M) : \mathbf{nf} (M)$$

$$T \vdash P \quad T; \Gamma, x : P \models c : N$$

$$T; \Gamma \models \lambda x : P. c : \mathbf{nf} (P \to N)$$

$$T; \Gamma \models \Lambda \alpha^{+} : c : \mathbf{nf} (\forall \alpha^{+} . N)$$

$$T \vdash P \quad T; \Gamma \vdash v : M \quad T; \Gamma \vdash v : M \quad v \Rightarrow \uparrow Q \dashv \Sigma; C$$

$$T; \Gamma \models v : M \quad T; \Gamma \vdash v : M \quad \tau \Rightarrow \uparrow Q \dashv \Sigma; C$$

$$\mathbf{uv} \ Q = \mathbf{dom} \ (C) \quad C \ \mathbf{singular} \ \mathbf{vin} \Rightarrow \mathbf{vin} \ T; \Gamma \vdash \mathbf{v} : N$$

$$T; \Gamma \vdash \mathbf{let} \ x = \mathbf{vin} \ (\mathbf{vin}) \ \mathbf{vin} \ \mathbf{vin$$

 $T : \Gamma : \Sigma_1 \models N \bullet \overrightarrow{v} \implies M = \Sigma_2 : C$ Application typing

$$T; \Gamma : \Sigma \vdash N \bullet \cdot \Rightarrow \mathbf{nf}(N) \dashv \Sigma ; \cdot \qquad T; \Gamma : \Sigma \vdash Q \Rightarrow P \dashv C_{1}$$

$$T; \Gamma : \Sigma \vdash N \bullet \overrightarrow{v} \Rightarrow M \dashv \Sigma' ; C_{2}$$

$$\Sigma \vdash C_{1} & \otimes C_{2} = C$$

$$T; \Gamma : \Sigma \vdash Q \rightarrow N \bullet v, \overrightarrow{v} \Rightarrow M \dashv \Sigma' ; C$$

$$\overrightarrow{T} : \Gamma : \Sigma \vdash \overrightarrow{A} \uparrow T \vdash [\overrightarrow{\alpha} \uparrow / \overrightarrow{\alpha} \uparrow] N \bullet \overrightarrow{v} \Rightarrow M \dashv \Sigma' ; C$$

$$\overrightarrow{\alpha} \uparrow \text{ are fresh } \overrightarrow{v} \neq \cdot \overrightarrow{\alpha} \uparrow \neq \cdot$$

$$T : \Gamma : \Sigma \vdash V \Rightarrow M \dashv \Sigma' : C \vdash V \Rightarrow M \dashv \Sigma' : C$$

 $T:\Gamma:\Sigma\models\forall\overrightarrow{\alpha^+}.\ N\bullet\overrightarrow{v}\Rightarrow M\exists\Sigma';C|_{\mathbf{uv}(N)\cup\mathbf{uv}(M)}$

Let us discuss the inference rules of the algorithm:

 (VAR^{INF}) infers the type of a variable by looking it up in the context and normalizing the result.

- ({}^{INF}) and (RET^{INF}) are similar to the declarative rules: they make a recursive call to type the body of the thunk or the return expression and put the shift on top of the result.
- (ANN^{INF}₊) and (ANN^{INF}₋) are symmetric. They make a recursive call to infer the type of the
 annotated expression, check that the inferred type is a subtype of the annotation, and return
 the normalized annotation.
- (λ^{INF}) infers the type of a lambda-abstraction. It makes a recursive call to infer the type of the body in the extended context, and returns the corresponding arrow type. Notice that the algorithm also normalizes the result, which is because the annotation type P is allowed to be non-normalized.
- (Λ^{INF}) infers the type of a big lambda. Similarly to the previous case, it makes a recursive call to infer the type of the body in the extended *type* context. After that, it returns the corresponding universal type. It is also required to normalize the result, because, for instance, α^+ might not occur in the body of the lambda, in which case the \forall must be removed.
- (LET^{INF}) is defined in a standard way: it makes a recursive call to infer the type of the bound value, and then returns the type of the body in the extended context.
- (LET_:@) is interpreted as follows. First, it infers the type of the head of the application, ensuring that it is a thunked computation $\downarrow M$; after that, it makes a recursive call to the application inference procedure, which returns the algorithmic type, whose instantiation to a declarative type must be associated with the bound variable x; then premise T; $\Sigma \models \uparrow Q \leq \uparrow P \Rightarrow C_2$ together with $\Sigma \vdash C_1 \& C_2 = C$ check whether the instantiation to the annotated type P is possible, and if it is, the algorithm infers the type of the body in the extended context, and returns it as the result.
- (LET_{:@}^{INF}) works similarly to (LET_{:@}^{INF}), However, since there is no annotation, instead of checking the instantiation to it, the algorithm checks that the inferred type $\uparrow Q$ is unique It is the case if all the algorithmic variables of $\uparrow Q$ are sufficiently restricted by C, which is checked by the combination of $\mathbf{uv} \ Q = \mathbf{dom} \ (C)$ and C singular with $\widehat{\sigma}$. Together, these two premises guarantee that the only possible instantiation of $\uparrow Q$ is $[\widehat{\sigma}] \ Q$.
- (LET_ \exists) works in the expected way. First, it infers the existential type $\exists \overrightarrow{\alpha}$. P of the value being unpacked, and since the type is guaranteed to be normalized, binds the quantified variables with $\overrightarrow{\alpha}$. Then it infers the type of the body in the appropriately extended context, and checks that the inferred type does not depend on $\overrightarrow{\alpha}$ by checking well-formedness $T \vdash N$.

Finally, let us discuss the algorithmic rules of the application inference:

- (Ø^{INF}_{•⇒}) is the base case. If the list of arguments is empty, the inferred type is the type of the head, and the algorithm returns it after normalizing.
- (→^{INF}

) is the main rule of algorithmic application inference. If the head has an arrow type Q → N, we find C₁—the minimal constraint ensuring that Q is a supertype of the first argument's type. Then we make a recursive call applying N to the rest of the arguments, and merge the resulting constraint with C₁
- (∀^{INF}_{•→}), analogously to the declarative case, is the rule ensuring the implicit elimination of the universal quantifiers. This is the place where the algorithmic variables are generated. The algorithm simply replaces the quantified variables α⁺ with fresh algorithmic variables α⁺, and makes a recursive call in the extended context.

The correctness of the algorithm consists of its soundness and completeness, which is by mutual induction in lemmas 91 and 92. The simplified result is the following.

Theorem.

```
- T; \Gamma \models c: N implies T; \Gamma \vdash c: N, and T; \Gamma \vdash c: N implies T; \Gamma \models c: \mathbf{nf}(N); + T; \Gamma \models v: P implies T; \Gamma \vdash v: P, and T; \Gamma \vdash v: P implies T; \Gamma \models v: P implies T; \Gamma \models v: P implies T; \Gamma \models v: P implies P implies
```

4.2 Constraint Singularity

The singularity algorithm used in (LET: $^{INF}_{:@}$) of the algorithmic typing check whether the constraint C is uniquely defines a substitution satisfying it, and if it does returns such a substitution as the result. To do that, we define a partial function C singular with $\widehat{\sigma}$, taking a subtyping constraint C and returning a substitution $\widehat{\sigma}$ —the only possible solution of C.

First, we define the notion of singularity on constraint entries. e singular with P and its negative counterpart are considered partial functions taking a constraint entry e and returning the type satisfying e if such a type is unique.

Algorithm 15 (Singular Constraint Entry).

e singular with P

$$\frac{\overline{\alpha}^{+} :\simeq P \text{ singular with nf } (P)}{\overline{\alpha}^{+} :\geqslant \exists \overline{\alpha}^{-}. \ \alpha^{+} \text{ singular with } \alpha^{+}} \qquad (:\geqslant \alpha^{SING})$$

$$\frac{\text{nf } (N) = \alpha^{-}_{i}}{\overline{\alpha}^{+} :\geqslant \exists \overline{\alpha}^{-}. \downarrow N \text{ singular with } \exists \alpha^{-}. \downarrow \alpha^{-}} \qquad (:\geqslant \downarrow^{SING})$$

e singular with N

$$\widehat{\widehat{\alpha}}^- :\simeq N \text{ singular with nf } (N) \qquad (\cong^{SING}_-)$$
The symmetric of the constraint entry cays that a variable must

- (\simeq_{-}^{SING}) and (\simeq_{+}^{SING}) are symmetric. If the constraint entry says that a variable must be equivalent to a type T, then it is evidently singular, and the only (up-to-equivalence) type instantiating this variable could be T. This way, we return its normal form.
- (:> α^{SING}) implies that the only (normalized) solution of $\widehat{\alpha}^+$:> $\exists \overrightarrow{\alpha}^-$. α^+ is α^+ (it will be shown in lemma 17).
- (: $\geqslant\downarrow^{\text{SING}}$) is perhaps the least obvious rule. In type $\exists \overrightarrow{\alpha}$. $\downarrow N$, if N is anything different (non-equivalent) to $\alpha^-_i \in \overrightarrow{\alpha}$, there are at least one proper supertype of $\exists \overrightarrow{\alpha}$. $\downarrow N$, since N can be abstracted over by an existential quantifier. Otherwise, any supertype of $\exists \overrightarrow{\alpha}$. $\downarrow \alpha^-_i$ is equivalent to it, and thus, the solution is unique.

Next, we extrapolate the singularity function on constraints—sets of constraint entries. We require C to be a set of singular constraints, and the resulting substitution sends each variable from $\operatorname{dom}(C)$ to the unique type satisfying the corresponding constraint.

Algorithm 16. C singular with $\widehat{\sigma}$ means that

(1) for any positive $e \in C$, there exists P such that e singular with P, and for any negative $e \in C$ there exists N such that e singular with N;

(2) $\widehat{\sigma}$ is defined as follows:

$$[\widehat{\sigma}]\widehat{\beta}^{+} = \begin{cases} P & \text{if there is } e \in \text{dom } (C) \text{ restricting } \widehat{\beta}^{+} \text{ and } e \text{ singular with } P \\ \widehat{\beta}^{+} & \text{otherwise} \end{cases}$$

$$[\widehat{\sigma}]\widehat{\beta}^{-} = \begin{cases} N & \text{if there is } e \in \text{dom } (C) \text{ restricting } \widehat{\beta}^{-} \text{ and } e \text{ singular with } N \\ \widehat{\beta}^{-} & \text{otherwise} \end{cases}$$

$$[\widehat{\sigma}]\widehat{\beta}^{-} = \begin{cases} N & \text{if there is } e \in \text{dom}(C) \text{ restricting } \widehat{\beta}^{-} \text{ and } e \text{ singular with } N \\ \widehat{\beta}^{-} & \text{otherwise} \end{cases}$$

The correctness of the singularity algorithm is formulated as follows:

Theorem. Suppose that C is a subtyping constraint. Then C singular with $\widehat{\sigma}$ holds if and only if $\widehat{\sigma}$ is the only (up-to-equivalence on dom(C)) normalized substitution satisfying C.

_

5 THEOREM STATEMENTS: DECLARATIVE 5.1 Type Well-Formedness

Lemma 1 (Soundness of type well-formedness).

- + $If T \vdash P then fv(P) \subseteq T$,
- -if T ⊢ N then fv (N) ⊆ T.

Lemma 2 (Completeness of type well-formedness). *In the well-formedness judgment, only used variables matter:*

```
+ if T_1 \cap \mathbf{fv} P = T_2 \cap \mathbf{fv} P then T_1 \vdash P \iff T_2 \vdash P,
```

$$-if T_1 \cap \mathbf{fv} N = T_2 \cap \mathbf{fv} N \text{ then } T_1 \vdash N \iff T_2 \vdash N.$$

Corollary 1 (Context Strengthening).

- + If $T \vdash P$ then $\mathbf{fv}(P) \vdash P$;
- If $T \vdash N$ then $\mathbf{fv}(N) \vdash N$.

Corollary 2 (Well-formedness Context Weakening). *Suppose that* $T_1 \subseteq T_2$, *then*

- + $if T_1 \vdash P then T_2 \vdash P$,
- $-if T_1 \vdash N then T_2 \vdash N$.

Lemma 3 (Well-formedness agrees with substitution). Suppose that $T_2 \vdash \sigma : T_1$. Then

- + $T, T_1 \vdash P$ implies $T, T_2 \vdash [\sigma]P$, and
- $-T, T_1 \vdash N \text{ implies } T, T_2 \vdash [\sigma]N.$

5.2 Substitution

Lemma 4 (Substitution strengthening). Restricting the substitution to the free variables of the substitution subject does not affect the result. Suppose that σ is a substitution, P and N are types. Then

```
+ [\sigma]_{P}^{P} = [\sigma|_{\text{fv}P}]_{P}^{P},
- [\sigma]_{N}^{N} = [\sigma|_{\text{fv}N}]_{N}^{N}
```

Lemma 5 (Signature of a restricted substitution). If $T_2 \vdash \sigma : T_1$ then $T_2 \vdash \sigma|_{vars} : T_1 \cap vars$.

Lemma 6. Suppose that σ is a substitution with signature $T_2 \vdash \sigma : T_1$. Then if vars is disjoint from T_1 , then $\sigma|_{vars} = \text{id}$.

Corollary 3 (Application of a disjoint substitution). *Suppose that* σ *is a substitution with signature* $T_2 \vdash \sigma : T_1$. Then

```
+ if T_1 \cap \mathbf{fv}(Q) = \emptyset then [\sigma]Q = Q;
```

- $if T_1 \cap \mathbf{fv}(N) = \emptyset \ then \ [\sigma]N = N.$

Lemma 7 (Substitution range weakening). Suppose that $T_2 \subseteq T_2'$ are contexts and σ is a substitution. Then $T_2 \vdash \sigma : T_1$ implies $T_2' \vdash \sigma : T_1$.

Lemma 8 (Substitutions Equivalent on Free Variables). Suppose that $T' \subseteq T$, σ_1 and σ_2 are substitutions of signature $T \vdash \sigma_i : T'$. Then

- + for a type $T \vdash P$, if $T \vdash [\sigma_1]P \simeq^{\leq} [\sigma_2]P$ then $T \vdash \sigma_1 \simeq^{\leq} \sigma_2 : \mathbf{fv} P \cap T'$;
- for a type $T \vdash N$, if $T \vdash [\sigma_1]N \simeq^{\leqslant} [\sigma_2]N$ then $T \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \mathbf{fv} N \cap T'$.

```
Lemma 9 (Substitution composition well-formedness). If T'_1 \vdash \sigma_1 : T_1 and T'_2 \vdash \sigma_2 : T_2, then
1275
         T_1', T_2' \vdash \sigma_2 \circ \sigma_1 : T_1, T_2.

5.4 Equivalence

 Lemma 23 (Declarative Equivalence is invariant under bijections). *Suppose* μ *is a bijection* μ $vars_1 \leftrightarrow vars_2$, then

- + $P_1 \simeq^D P_2$ implies $[\mu]P_1 \simeq^D [\mu]P_2$, and there exists an inference tree of $[\mu]P_1 \simeq^D [\mu]P_2$ with the same shape as the one inferring $P_1 \simeq^D P_2$;
- $N_1 \simeq^D N_2$ implies $[\mu]N_1 \simeq^D [\mu]N_2$, and there exists an inference tree of $[\mu]N_1 \simeq^D [\mu]N_2$ with the same shape as the one inferring $N_1 \simeq^D N_2$.

Lemma 24. The set of free variables is invariant under equivalence.

```
- If N \simeq^D M then \mathbf{fv} N = \mathbf{fv} M (as sets)
```

+ If
$$P \simeq^D Q$$
 then $\text{fv } P = \text{fv } Q$ (as sets)

Lemma 25 (Declarative equivalence is transitive).

```
+ if P_1 \simeq^D P_2 and P_2 \simeq^D P_3 then P_1 \simeq^D P_3,
```

- if
$$N_1 \simeq^D N_2$$
 and $N_2 \simeq^D N_3$ then $N_1 \simeq^D N_3$.

Lemma 26 (Type well-formedness is invariant under equivalence). *Mutual subtyping implies declarative equivalence.*

```
+ if \mathbf{P} \simeq^D \mathbf{Q} then T \vdash \mathbf{P} \iff T \vdash \mathbf{Q},
```

$$-if N \simeq^D M then T \vdash N \iff T \vdash M$$

Lemma 27 (Soundness of equivalence). Declarative equivalence implies mutual subtyping.

```
+ if T \vdash P, T \vdash Q, and P \simeq^D Q then T \vdash P \simeq^{\leq} Q,
```

$$-ifT \vdash N, T \vdash M, and N \simeq^D M then T \vdash N \simeq^{\leq} M.$$

Lemma 28 (Subtyping induced by disjoint substitutions). *Suppose that* $T \vdash \sigma_1 : T_1$ *and* $T \vdash \sigma_2 : T_1$, where $T_i \subseteq T$ and $T_1 \cap T_2 = \emptyset$. Then

```
- assuming T \vdash N, T \vdash [\sigma_1]N \leq [\sigma_2]N implies T \vdash \sigma_i \simeq^{\leq} id : fv N
```

+ assuming
$$T \vdash P$$
, $T \vdash [\sigma_1]P \geqslant [\sigma_2]P$ implies $T \vdash \sigma_i \simeq^{\leqslant} id : \mathbf{fv} P$

Corollary 11 (Substitution cannot induce proper subtypes or supertypes). *Assuming all mentioned types are well-formed in* T *and* σ *is a substitution* $T \vdash \sigma : T$,

```
T \vdash [\sigma]N \leq N \implies T \vdash [\sigma]N \simeq^{\leqslant} N \text{ and } T \vdash \sigma \simeq^{\leqslant} \mathrm{id} : \mathbf{fv} N
T \vdash N \leq [\sigma]N \implies T \vdash N \simeq^{\leqslant} [\sigma]N \text{ and } T \vdash \sigma \simeq^{\leqslant} \mathrm{id} : \mathbf{fv} N
T \vdash [\sigma]P \geqslant P \implies T \vdash [\sigma]P \simeq^{\leqslant} P \text{ and } T \vdash \sigma \simeq^{\leqslant} \mathrm{id} : \mathbf{fv} P
T \vdash P \geqslant [\sigma]P \implies T \vdash P \simeq^{\leqslant} [\sigma]P \text{ and } T \vdash \sigma \simeq^{\leqslant} \mathrm{id} : \mathbf{fv} P
```

Lemma 29 (Mutual substitution and subtyping). Assuming that the mentioned types (P, Q, N, and M) are well-formed in T and that the substitutions (σ_1 and σ_2) have signature $T \vdash \sigma_i : T$,

```
+ if T \vdash [\sigma_1]P \geqslant Q and T \vdash [\sigma_2]Q \geqslant P
then there exists a bijection \mu : \mathbf{fv} P \leftrightarrow \mathbf{fv} Q such that T \vdash \sigma_1 \simeq^{\leqslant} \mu : \mathbf{fv} P and T \vdash \sigma_2 \simeq^{\leqslant} \mu^{-1}
\mathbf{fv} Q;
```

- if $T \vdash [\sigma_1]N \leqslant M$ and $T \vdash [\sigma_2]N \leqslant M$ then there exists a bijection $\mu : \mathbf{fv} \ N \leftrightarrow \mathbf{fv} \ M$ such that $T \vdash \sigma_1 \simeq^{\leqslant} \mu : \mathbf{fv} \ N$ and $T \vdash \sigma_2 \simeq^{\leqslant} \mu^{-1}$ $\mathbf{fv} \ M$.

Vol. 1. No. 1. Article - Publication date: November 2023

Lemma 30 (Equivalent substitution act equivalently). Suppose that $T' \vdash \sigma_1 : T$ and $T' \vdash \sigma_2 : T$ are substitutions equivalent on their domain, that is $T' \vdash \sigma_1 \simeq^{\leq} \sigma_2 : T$. Then $+ \text{ for any } T \vdash P, T' \vdash [\sigma_1]P \simeq^{\leq} [\sigma_2]P$;

Lemma 31 (Equivalence of polymorphic types).

- for any $T \vdash N$, $T' \vdash [\sigma_1]N \simeq^{\leq} [\sigma_2]N$.

```
- For T \vdash \forall \alpha^{+}. N and T \vdash \forall \beta^{+}. M,

if T \vdash \forall \alpha^{+}. N \simeq^{\leq} \forall \beta^{+}. M then there exists a bijection \mu : \beta^{+} \cap \text{fv } M \leftrightarrow \alpha^{+} \cap \text{fv } N such that T, \alpha^{+} \vdash N \simeq^{\leq} [\mu]M,

+ For T \vdash \exists \alpha^{-}. P and T \vdash \exists \beta^{-}. Q,
```

+ For $T \vdash \exists \overrightarrow{\alpha^2}$. P and $T \vdash \exists \beta^-$. Q, if $T \vdash \exists \overrightarrow{\alpha^2}$. $P \simeq^{\leqslant} \exists \overrightarrow{\beta^-}$. Q then there exists a bijection $\mu : \overrightarrow{\beta^-} \cap \mathbf{fv} \ Q \leftrightarrow \overrightarrow{\alpha^-} \cap \mathbf{fv} \ P$ such that $T, \overrightarrow{\beta^-} \vdash P \simeq^{\leqslant} [\mu] Q$.

Lemma 32 (Completeness of Equivalence). Mutual subtyping implies declarative equivalence. Assuming all the types below are well-formed in T:

```
+ if T \vdash P \simeq^{\leqslant} Q then P \simeq^{D} Q,

- if T \vdash N \simeq^{\leqslant} M then N \simeq^{D} M.
```

5.5 Variable Ordering

Observation 1 (Ordering is deterministic). If ord vars in $N = \vec{\alpha}_1$ and ord vars in $N = \vec{\alpha}_2$ then $\vec{\alpha}_1 = \vec{\alpha}_2$. If ord vars in $P = \vec{\alpha}_1$ and ord vars in $P = \vec{\alpha}_2$ then $\vec{\alpha}_1 = \vec{\alpha}_2$. This way, we can use ord vars in P and as a function on P, and ord vars in P as a function on P.

Lemma 33 (Soundness of variable ordering). *Variable ordering extracts used free variables*.

```
- ord vars in N = vars \cap fv N (as sets)
+ ord vars in P = vars \cap fv P (as sets)
```

Corollary 12 (Additivity of ordering). Variable ordering is additive (in terms of set union) with respect to its first argument.

```
- ord (vars_1 \cup vars_2) in N = ord vars_1 in N \cup ord vars_2 in N (as sets)
+ ord (vars_1 \cup vars_2) in P = ord vars_1 in P \cup ord vars_2 in P (as sets)
```

Lemma 34 (Weakening of ordering). Only used variables matter in the first argument of the ordering

```
- ord (vars ∩ fv N) in N = ord vars in N
+ ord (vars ∩ fv P) in P = ord vars in P
```

Corollary 13 (Idempotency of ordering).

```
- If ord vars in N = \vec{\alpha} then ord \vec{\alpha} in N = \vec{\alpha},
+ If ord vars in \vec{P} = \vec{\alpha} then ord \vec{\alpha} in \vec{P} = \vec{\alpha};
```

Lemma 35 (Distributivity of renaming over variable ordering). Suppose that μ is a bijection between two sets of variables $\mu : A \leftrightarrow B$.

- If μ is collision-free on vars and $\operatorname{fv} N$ then $[\mu](\operatorname{ord} \operatorname{vars}\operatorname{in} N) = \operatorname{ord}([\mu]\operatorname{vars})\operatorname{in}[\mu]N$
- + If μ is collision-free on vars and $\operatorname{fv} P$ then $[\mu](\operatorname{ord} \operatorname{varsin} P) = \operatorname{ord}([\mu]\operatorname{vars})$ in $[\mu]P$

Observation 2 (Normalization is deterministic). If $\mathbf{nf}(N) = M$ and $\mathbf{nf}(N) = M'$ then M = M'. If $\mathbf{nf}(P) = Q$ and $\mathbf{nf}(P) = Q'$ then Q = Q'. This way, we can use normalization as a function.

Lemma 38. Free variables are not changed by the normalization

```
- fv N = fv nf (N)
+ fv P = fv nf (P)
```

Lemma 39 (Soundness of normalization).

```
- N \simeq^D \mathbf{nf}(N) 
+ P \simeq^D \mathbf{nf}(P)
```

Corollary 14 (Normalization preserves well-formedness).

```
+ T \vdash P \iff T \vdash \mathbf{nf}(P),
- T \vdash N \iff T \vdash \mathbf{nf}(N)
```

Corollary 15 (Normalization preserves well-formedness of substitution).

```
T_2 \vdash \sigma : T_1 \iff T_2 \vdash \mathbf{nf}(\sigma) : T_1
```

Lemma 40 (Normalization preserves substitution signature). Suppose that σ is a substitution, T_1 and T_2 are contexts. Then $T_2 \vdash \sigma : T_1$ implies $T_2 \vdash \mathbf{nf}(\sigma) : T_1$.

Corollary 16 (Normalization is sound w.r.t. subtyping-induced equivalence).

```
+ if T \vdash P then T \vdash P \simeq^{\leq} \mathbf{nf}(P),

- if T \vdash N then T \vdash N \simeq^{\leq} \mathbf{nf}(N).
```

Corollary 17 (Normalization preserves subtyping). Assuming all the types are well-formed in context T,

```
+ T \vdash P \geqslant Q \iff T \vdash \mathbf{nf}(P) \geqslant \mathbf{nf}(Q),

- T \vdash N \leqslant M \iff T \vdash \mathbf{nf}(N) \leqslant \mathbf{nf}(M).
```

Corollary 18 (Normalization preserves ordering). For any vars,

```
- ord vars in nf(N) = ord vars in M
```

+ ord vars in nf (P) = ord vars in Q

Lemma 41 (Distributivity of normalization over substitution). Normalization of a term distributes over substitution. Suppose that σ is a substitution, N and P are types. Then

```
- \mathbf{nf} ([\sigma]N) = [\mathbf{nf} (\sigma)]\mathbf{nf} (N)
```

+ $\operatorname{nf}([\sigma]P) = [\operatorname{nf}(\sigma)]\operatorname{nf}(P)$

where $\mathbf{nf}(\sigma)$ means pointwise normalization: $[\mathbf{nf}(\sigma)]\alpha^- = \mathbf{nf}([\sigma]\alpha^-)$.

Corollary 19 (Commutativity of normalization and renaming). *Normalization of a term commutes* with renaming. Suppose that μ is a bijection between two sets of variables $\mu : A \leftrightarrow B$. Then

```
- \mathbf{nf} ([\mu]N) = [\mu]\mathbf{nf} (N)
+ \mathbf{nf} ([\mu]P) = [\mu]\mathbf{nf} (P)
```

Lemma 42 (Completeness of Normalization w.r.t. Declarative Equivalence). *Normalization returns the same representative for equivalent types.*

```
- If N \simeq^D M then \operatorname{nf}(N) = \operatorname{nf}(M),
+ if P \simeq^D Q then \operatorname{nf}(P) = \operatorname{nf}(Q).
```

Lemma 43 (Algorithmization of Declarative Equivalence). *Declarative equivalence is the equality of normal forms.*

```
+ P \simeq^D Q \iff \operatorname{nf}(P) = \operatorname{nf}(Q),
- N \simeq^D M \iff \operatorname{nf}(N) = \operatorname{nf}(M).
```

Corollary 20 (Completeness of Normalization w.r.t. Subtyping-Induced Equivalence). *Assuming all the types below are well-formed in T:*

```
+ if T \vdash P \simeq^{\leq} Q then nf(P) = nf(Q),

- if T \vdash N \simeq^{\leq} M then nf(N) = nf(M).
```

Lemma 44 (Idempotence of normalization). *Normalization is idempotent*

```
- \operatorname{nf} (\operatorname{nf} (N)) = \operatorname{nf} (N) 
+ \operatorname{nf} (\operatorname{nf} (P)) = \operatorname{nf} (P)
```

Lemma 45. The result of a substitution is normalized if and only if the initial type and the substitution are normalized.

Suppose that σ is a substitution $T_2 \vdash \sigma : T_1$, P is a positive type $(T_1 \vdash P)$, N is a negative type $(T_1 \vdash N)$. Then

```
+ \ [\sigma]P \ is \ normal \iff \begin{cases} \sigma|_{\mathsf{fv}\,(P)} & \text{is normal} \\ P & \text{is normal} \end{cases}
- \ [\sigma]N \ is \ normal \iff \begin{cases} \sigma|_{\mathsf{fv}\,(N)} & \text{is normal} \\ N & \text{is normal} \end{cases}
```

Lemma 46 (Algorithmization of subtyping-induced equivalence). *Mutual subtyping is the equality of normal forms. Assuming all the types below are well-formed in T:*

```
+ T \vdash P \simeq^{\leq} Q \iff \operatorname{nf}(P) = \operatorname{nf}(Q),

- T \vdash N \simeq^{\leq} M \iff \operatorname{nf}(N) = \operatorname{nf}(M).
```

Corollary 21 (Substitution preserves declarative equivalence). Suppose that σ is a substitution. Then

```
+ P \simeq^D Q implies [\sigma]P \simeq^D [\sigma]Q

- N \simeq^D M implies [\sigma]N \simeq^D [\sigma]M
```

```
Lemma 47. If T : \Gamma \vdash N_1 \bullet \overrightarrow{v} \implies M and T \vdash N_1 \simeq^{\leqslant} N_2 then T : \Gamma \vdash N_2 \bullet \overrightarrow{v} \implies M.
```

Lemma 48 (Declarative typing is preserved under context equivalence). Assuming $T \vdash \Gamma_1, T \vdash \Gamma_2$ and $T \vdash \Gamma_1 \simeq^{\leq} \Gamma_2$:

- + for any tree T_1 inferring $T; \Gamma_1 \vdash \nu : P$, there exists a tree T_2 inferring $T; \Gamma_2 \vdash \nu : P$.
- for any tree T_1 inferring $T; \Gamma_1 \vdash c : N$, there exists a tree T_2 inferring $T; \Gamma_2 \vdash c : N$.
- for any tree T_1 inferring $T; \Gamma_1 \vdash N \bullet \overrightarrow{v} \implies M$, there exists a tree T_2 inferring $T; \Gamma_2 \vdash N \bullet \overrightarrow{v} \implies M$

THEOREM STATEMENTS: ALGORITHMIC

7.1 Algorithmic Type Well-formedness

```
Lemma 49. If T : \Gamma \vdash N_1 \bullet \overrightarrow{v} \implies M and T \vdash N_1 \simeq^{\leqslant} N_2 then T : \Gamma \vdash N_2 \bullet \overrightarrow{v} \implies M.
```

Lemma 50 (Soundness of algorithmic type well-formedness).

```
+ if T : \Upsilon \vdash P then \mathbf{fv}(P) \subseteq T and \mathbf{uv}(P) \subseteq \Upsilon;
```

- if T;
$$\Upsilon$$
 + \mathbb{N} then $\mathbf{fv}(\mathbb{N}) \subseteq T$ and $\mathbf{uv}(\mathbb{N}) \subseteq \Upsilon$.

Lemma 51 (Completeness of algorithmic type well-formedness). *In the well-formedness judgment* only used variables matter:

```
+ if T_1 \cap \mathbf{fv} \stackrel{\mathbf{P}}{=} T_2 \cap \mathbf{fv} \stackrel{\mathbf{P}}{=} and \Upsilon_1 \cap \mathbf{uv} \stackrel{\mathbf{P}}{=} \Upsilon_2 \cap \mathbf{uv} \stackrel{\mathbf{P}}{=} then T_1 ; \Upsilon_1 \vdash \stackrel{\mathbf{P}}{=} \iff T_2 ; \Upsilon_2 \vdash \stackrel{\mathbf{P}}{=}, and
-if T_1 \cap \mathbf{fv} N = T_2 \cap \mathbf{fv} N \text{ and } \Upsilon_1 \cap \mathbf{uv} N = \Upsilon_2 \cap \mathbf{uv} N \text{ then } T_1; \Upsilon_1 \vdash N \iff T_2; \Upsilon_2 \vdash N.
```

Lemma 52 (Variable algorithmization agrees with well-formedness).

```
+ T, \overrightarrow{\alpha} + P implies T; \overrightarrow{\alpha} + [\overrightarrow{\alpha}]/(\overrightarrow{\alpha})P;

- T, \overrightarrow{\alpha} + N implies T; \overrightarrow{\alpha} + [\overrightarrow{\alpha}]/(\overrightarrow{\alpha})N.
```

Lemma 53 (Variable de-algorithmization agrees with well-formedness).

```
+ T; \overrightarrow{\alpha} + \overrightarrow{P} implies T, \overrightarrow{\alpha} + [\overrightarrow{\alpha}] \overrightarrow{P};

- T; \overrightarrow{\alpha} + N implies T, \overrightarrow{\alpha} + [\overrightarrow{\alpha}] \overrightarrow{N}.
```

Corollary 22 (Well-formedness Algorithmic Context Weakening). Suppose that $T_1 \subseteq T_2$, and $\Upsilon_1 \subseteq \Upsilon_2$. Then

```
+ if T_1; \Upsilon_1 \vdash P implies T_2; \Upsilon_2 \vdash P,
- if T_1; \Upsilon_1 \vdash N implies T_2; \Upsilon_2 \vdash N.
```

7.2 Algorithmic Substitution

Lemma 54 (Determinicity of typing algorithm). *Suppose that* $T \vdash \Gamma$ *and* $T \vdash^{\supseteq} \Sigma$. *Then*

```
+ If T; \Gamma \models \nu: P and T; \Gamma \models \nu: P' then P = P'.
```

- If T; $\Gamma \models c$: N and T; $\Gamma \models c$: N' then N = N'.
- If $T : \Gamma : \Sigma \models \mathbb{N} \bullet \overrightarrow{v} \implies M = \Sigma' : C \text{ and } T : \Gamma : \Sigma \models \mathbb{N} \bullet \overrightarrow{v} \implies M' = \Sigma' : C' \text{ then } M = M'$ $\Sigma = \Sigma'$, and C = C'.

Lemma 55 (Algorithmic Substitution Strengthening). *Restricting the substitution to the algorith* mic variables of the substitution subject does not affect the result. Suppose that $\widehat{\sigma}$ is an algorithmic substitution, P and N are algorithmic types. Then

$$+ [\widehat{\sigma}] P = [\widehat{\sigma}|_{uv} P] P,$$

1664 1666 $- [\widehat{\sigma}] N = [\widehat{\sigma}|_{\mathbf{uv} N}] N$

Lemma 56 (Substitutions equal on the algorithmic variables). Suppose that $\widehat{\sigma}_1$ and $\widehat{\sigma}_2$ are normalized substitutions of signature $\Sigma \vdash \widehat{\sigma}_i : \Upsilon$. Then

- + for a normalized type T; $\Upsilon \vdash P$, if $[\widehat{\sigma}_1]P = [\widehat{\sigma}_2]P$ then $\widehat{\sigma}_1|_{(uvP)} = \widehat{\sigma}_2|_{(uvP)}$;
- for a normalized type T; $\Upsilon \vdash N$, if $[\widehat{\sigma}_1]N = [\widehat{\sigma}_2]N$ then $\widehat{\sigma}_1|_{(\mathbf{uv},N)} = \widehat{\sigma}_2|_{(\mathbf{uv},N)}$.

Corollary 23 (Substitutions equivalent on the algorithmic variables). Suppose that $\widehat{\sigma}_1$ and $\widehat{\sigma}_2$ are substitutions of signature $\Sigma \vdash \widehat{\sigma}_i : \Upsilon$ where $T \vdash^{\supseteq} \Sigma$. Then

- + for a type $T : \Upsilon \vdash P$, if $T \vdash [\widehat{\sigma}_1]P \simeq^{\leqslant} [\widehat{\sigma}_2]P$ then $\Sigma \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : \mathbf{uv} P$;
- for a type T; $\Upsilon \vdash N$, if $T \vdash [\widehat{\sigma}_1] N \simeq^{\leq} [\widehat{\sigma}_2] N$ then $\Sigma \vdash \widehat{\sigma}_1 \simeq^{\leq} \widehat{\sigma}_2 : \mathbf{uv} N$.

7.3 Algorithmic Normalization

Lemma 57 (Determinicity of typing algorithm). Suppose that $T \vdash \Gamma$ and $T \vdash^{\supseteq} \Sigma$. Then

- + If T; $\Gamma \models \nu$: P and T; $\Gamma \models \nu$: P' then P = P'.
- If T; $\Gamma \models c$: N and T; $\Gamma \models c$: N' then N = N'.
- If $T : \Gamma : \Sigma \models N \bullet \overrightarrow{v} \implies M = \Sigma' : C \text{ and } T : \Gamma : \Sigma \models N \bullet \overrightarrow{v} \implies M' = \Sigma' : C' \text{ then } M = M'$ $\Sigma = \Sigma'$, and C = C'.

Lemma 58 (Algorithmic variables are not changed by the normalization).

- $uv N \equiv uv nf(N)$
- $+ uv P \equiv uv nf (P)$

Lemma 59 (Soundness of normalization of algorithmic types).

- $N \simeq^D \mathbf{nf}(N)$
- + $\mathbf{P} \simeq^D \mathbf{nf} (\mathbf{P})$

7.4 Algorithmic Equivalence

Lemma 60 (Algorithmic type well-formedness is invariant under equivalence). *Mutual subtyping* implies declarative equivalence.

- + if $P \simeq^D Q$ then $T ; \Upsilon \vdash P \iff T ; \Upsilon \vdash Q$,
- $-if N \simeq^D M \text{ then } T : \Upsilon \vdash N \iff T : \Upsilon \vdash M$

Corollary 24 (Normalization preserves well-formedness of algorithmic types).

- $+ T ; \Upsilon \vdash P \iff T ; \Upsilon \vdash \mathbf{nf}(P),$
- $-T: \Upsilon \vdash \mathbb{N} \iff T: \Upsilon \vdash \mathbf{nf}(\mathbb{N})$

Corollary 25 (Normalization preserves the signature of the algorithmic substitution). $\Sigma \vdash \widehat{\sigma} : \Upsilon \iff \Sigma \vdash \mathbf{nf}(\widehat{\sigma}) : \Upsilon, T \vdash \widehat{\sigma} : \Upsilon \iff T \vdash \mathbf{nf}(\widehat{\sigma}) : \Upsilon.$

Corollary 26 (Algorithmic substitution equivalence becomes equality after normalization). Suppose that $\Sigma \vdash \widehat{\sigma}_1 : \Upsilon'$ and $\Sigma \vdash \widehat{\sigma}_2 : \Upsilon'$ are algorithmic substitutions and $\Upsilon \subseteq \Upsilon'$. Then $\Sigma \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : \Upsilon \Leftarrow$ $\mathbf{nf}(\widehat{\sigma}_1)|_{\Upsilon} = \mathbf{nf}(\widehat{\sigma}_2)|_{\Upsilon}.$

7.5 Unification Constraint Merge

Observation 3 (Unification Constraint Merge Determinism). Suppose that $\Sigma \vdash UC_1$ and $\Sigma \vdash UC_2$ If $\Sigma \vdash UC_1 \& UC_2 = UC$ and $\Sigma \vdash UC_1 \& UC_2 = UC'$ are defined then UC = UC'.

Lemma 61 (Soundness of Unification Constraint Merge). Suppose that $\Sigma \vdash UC_1$ and $\Sigma \vdash UC_2$ are normalized unification constraints. If $\Sigma \vdash UC_1 \& UC_2 = UC$ is defined then $UC = UC_1 \cup UC_2$.

Corollary 27. Suppose that $\Sigma \vdash UC_1$ and $\Sigma \vdash UC_2$ are normalized unification constraints. If $\Sigma \vdash UC_1 \& UC_2 = UC$ is defined then

- (1) $\Sigma \vdash UC$ is normalized unification constraint,
- (2) for any substitution $\Sigma \vdash \widehat{\sigma} : \mathbf{dom}(UC), \Sigma \vdash \widehat{\sigma} : UC \text{ implies } \Sigma \vdash \widehat{\sigma} : UC_1 \text{ and } \Sigma \vdash \widehat{\sigma} : UC_2.$

Lemma 62 (Completeness of Unification Constraint Entry Merge). For a fixed context T, suppose that $T \vdash ue_1$ and $T \vdash ue_2$ are matching constraint entries.

- + for a type P such that $T \vdash P$: ue_1 and $T \vdash P$: ue_2 , $T \vdash ue_1 \& ue_2 = ue$ is defined and $T \vdash P$: ue_1
- for a type N such that $T \vdash N : ue_1$ and $T \vdash N : ue_2$, $T \vdash ue_1 \& ue_2 = ue$ is defined and $T \vdash N : ue$.

Lemma 63 (Completeness of Unification Constraint Merge). Suppose that $\Sigma \vdash UC_1$ and $\Sigma \vdash UC_2$. Then for any $\Upsilon \supseteq \mathbf{dom}(UC_1) \cup \mathbf{dom}(UC_2)$ and substitution $\Sigma \vdash \widehat{\sigma} : \Upsilon$ such that $\Sigma \vdash \widehat{\sigma} : UC_1$ and $\Sigma \vdash \widehat{\sigma} : UC_2$,

- (1) $\Sigma \vdash UC_1 \& UC_2 = UC$ is defined and
- (2) $\Sigma \vdash \widehat{\sigma} : UC$.

7.6 Unification

Observation 4 (Unification Determinism).

- + If $T; \Sigma \models P \stackrel{u}{\simeq} O = UC$ and $T; \Sigma \models P \stackrel{u}{\simeq} O = UC'$ then UC = UC'.
- If $T; \Sigma \models \mathbb{N} \stackrel{u}{\simeq} M = UC$ and $T; \Sigma \models \mathbb{N} \stackrel{u}{\simeq} M = UC'$ then UC = UC'.

Lemma 64 (Soundness of Unification).

- + For normalized P and Q such that T; $\operatorname{dom}(\Sigma) \vdash P$ and $T \vdash Q$, if $T; \Sigma \vdash P \stackrel{u}{\simeq} Q = UC$ then $\Sigma \vdash UC : \operatorname{uv} P$ and for any normalized $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : UC$, $[\widehat{\sigma}]P = Q$.
- For normalized N and M such that T; $\operatorname{dom}(\Sigma) \vdash N$ and $T \vdash M$, if $T; \Sigma \vdash N \stackrel{u}{\cong} M \dashv UC$ then $\Sigma \vdash UC : \operatorname{uv} N$ and for any normalized $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : UC$, $[\widehat{\sigma}] N = M$.

Lemma 65 (Completeness of Unification).

- + For normalized \underline{P} and \underline{Q} such that $T : \operatorname{dom}(\Sigma) + \underline{P}$ and $T + \underline{Q}$, suppose that there exists $\Sigma + \widehat{\sigma} : \operatorname{uv}(\underline{P})$ such that $[\widehat{\sigma}] \underline{P} = \underline{Q}$, then $T : \Sigma \models \underline{P} \stackrel{u}{\simeq} \underline{Q} = UC$ for some UC.
- For normalized N and M such that T; $\operatorname{dom}(\Sigma) \vdash N$ and $T \vdash M$, suppose that there exists $\Sigma \vdash \widehat{\sigma} : \operatorname{uv}(N)$ such that $[\widehat{\sigma}] N = M$, then $T; \Sigma \models N \stackrel{u}{\simeq} M \dashv UC$ for some UC.

Observation 5 (Determinism of Anti-unification Algorithm).

- $+ If T \models \underset{\leftarrow}{P_1} \stackrel{a}{\simeq} \underset{\leftarrow}{P_2} = (\Upsilon, \underset{\leftarrow}{Q}, \widehat{\tau}_1, \widehat{\tau}_2) \ and \ T \models \underset{\leftarrow}{P_1} \stackrel{a}{\simeq} \underset{\leftarrow}{P_2} = (\Upsilon', \underset{\leftarrow}{Q'}, \widehat{\tau}_1', \widehat{\tau}_2'), \ then \ \Upsilon = \Upsilon', \underset{\leftarrow}{Q} = \underset{\leftarrow}{Q'}, \widehat{\tau}_1 = \widehat{\tau}_1'$ and $\widehat{\tau}_2 = \widehat{\tau}_2'$.
- $-If T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2) \text{ and } T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon', M', \widehat{\tau}_1', \widehat{\tau}_2'), \text{ then } \Upsilon = \Upsilon', M = M'$ $\widehat{\tau}_1 = \widehat{\tau}_1', \text{ and } \widehat{\tau}_2 = \widehat{\tau}_2'.$

Observation 6 (Uniqueness of Anti-unification Variable Names). *Names of the anti-unification* variables are uniquely defined by the types they are mapped to by the resulting substitutions.

- + Assuming P_1 and P_2 are normalized, if $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ then for any $\widehat{\beta}^- \in \Upsilon$ $\widehat{\beta}^- = \widehat{\alpha}^-_{\{[\widehat{\tau}_1]\widehat{\beta}^-, [\widehat{\tau}_2]\widehat{\beta}^-\}}$
- Assuming N_1 and N_2 are normalized, if $T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ then for any $\widehat{\beta}^- \in \Upsilon$ $\widehat{\beta}^- = \widehat{\alpha}^-_{\{[\widehat{\tau}_1]\widehat{\beta}^-, [\widehat{\tau}_2]\widehat{\beta}^-\}}$

Lemma 66 (Soundness of Anti-Unification).

- + Assuming P_1 and P_2 are normalized, if $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ then
 - (1) $T : \Upsilon \vdash Q$,
 - (2) $T : \Gamma_i : \Gamma$ for $i \in \{1, 2\}$ are anti-unification substitutions, and
 - (3) $\left[\widehat{\tau}_{i}\right]Q = P_{i} \text{ for } i \in \{1, 2\}.$
- Assuming N_1 and N_2 are normalized, if $T \models N_1 \stackrel{a}{\simeq} N_2 \dashv (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ then
 - (1) $T : \Upsilon \vdash M$
 - (2) $T: \vdash \widehat{\tau}_i : \Upsilon$ for $i \in \{1, 2\}$ are anti-unification substitutions, and
 - (3) $[\widehat{\tau}_i]M = N_i \text{ for } i \in \{1, 2\}.$

Lemma 67 (Completeness of Anti-Unification).

- + Assume that P_1 and P_2 are normalized, and there exists $(\Upsilon', Q', \widehat{\tau}'_1, \widehat{\tau}'_2)$ such that
 - (1) $T : \Upsilon' \vdash Q'$,
 - (2) $T : \Gamma_i : \Gamma' \text{ for } i \in \{1, 2\}$ are anti-unification substitutions, and
 - (3) $[\widehat{\tau}'_i]Q' = P_i \text{ for } i \in \{1, 2\}.$

Then the anti-unification algorithm terminates, that is there exists $(\Upsilon, \overline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ such that $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, \overline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$

- Assume that N_1 and N_2 are normalized, and there exists $(\Upsilon', M', \widehat{\tau}'_1, \widehat{\tau}'_2)$ such that
 - (1) $T : \Upsilon' \vdash M'$,
 - (2) $T : \Gamma_i : \Gamma'_i : \Gamma'_i$ for $i \in \{1, 2\}$, are anti-unification substitutions, and
 - (3) $[\hat{\tau}'_i]M' = N_i \text{ for } i \in \{1, 2\}.$

Then the anti-unification algorithm succeeds, that is there exists $(\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ such that $T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$.

Lemma 68 (Initiality of Anti-Unification).

- + Assume that P_1 and P_2 are normalized, and $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$, then $(\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ is more specific than any other sound anti-unifier $(\Upsilon', Q', \widehat{\tau}'_1, \widehat{\tau}'_2)$, i.e. if
 - (1) $T : \Upsilon' \vdash Q'$,
 - (2) $T: \cdot \vdash \widehat{\tau}'_i : \Upsilon' \text{ for } i \in \{1, 2\}, \text{ and }$

```
1765
1766
1767
1768
1769
```

(3) $[\hat{\tau}'_i] Q' = P_i \text{ for } i \in \{1, 2\}$

then there exists $\widehat{\rho}$ such that T; $\Upsilon \vdash \widehat{\rho} : (\Upsilon'|_{\mathbf{uv} \ \underline{Q'}})$ and $[\widehat{\rho}] \ \underline{Q'} = \underline{Q}$. Moreover, $[\widehat{\rho}] \widehat{\beta}^-$ can be uniquely determined by $[\widehat{\tau}'_1] \widehat{\beta}^-$, $[\widehat{\tau}'_2] \widehat{\beta}^-$, and T.

- Assume that N_1 and N_2 are normalized, and $T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$, then $(\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ is more specific than any other sound anti-unifier $(\Upsilon', M', \widehat{\tau}'_1, \widehat{\tau}'_2)$, i.e. if
 - (1) $T : \Upsilon' \vdash M'$,
 - (2) $T : \Gamma_i : \Gamma'_i : \Gamma' \text{ for } i \in \{1, 2\}, \text{ and } i \in \{1, 2\}$
 - (3) $[\hat{\tau}'_i]M' = N_i \text{ for } i \in \{1, 2\}$

then there exists $\widehat{\rho}$ such that $T : \Upsilon \vdash \widehat{\rho} : (\Upsilon'|_{\mathbf{uv} M'})$ and $[\widehat{\rho}]M' = M$. Moreover, $[\widehat{\rho}]\widehat{\beta}^-$ can be uniquely determined by $[\widehat{\tau}'_1]\widehat{\beta}^-$, $[\widehat{\tau}'_2]\widehat{\beta}^-$, and T.

7.8 Upper Bounds

Observation 7 (Determinism of Least Upper Bound algorithm). For types $T \vdash P_1$, and $T \vdash P_2$, if $T \models P_1 \lor P_2 = Q$ and $T \models P_1 \lor P_2 = Q'$ then Q = Q'.

Lemma 69 (Characterization of the Supertypes). Let us define the set of upper bounds of a positive type UB(P) in the following way:

$$T \vdash P$$

$$UB(T \vdash P)$$

$$T \vdash \beta^{+}$$

$$\{\exists \overrightarrow{\alpha}^{-}. \beta^{+} \mid for \overrightarrow{\alpha}^{-}\}\}$$

$$T \vdash \exists \overrightarrow{\beta}^{-}. Q$$

$$UB(T, \overrightarrow{\beta}^{-} \vdash Q) \text{ not using } \overrightarrow{\beta}^{-}$$

$$T \vdash \downarrow M$$

$$\{\exists \overrightarrow{\alpha}^{-}. \downarrow M' \mid for \overrightarrow{\alpha}^{-}, M', and \overrightarrow{N} \text{ s.t.}$$

$$T \vdash N_{i}, T, \overrightarrow{\alpha}^{-} \vdash M', and [\overrightarrow{N}/\overrightarrow{\alpha}^{-}] \downarrow M' \simeq^{D} \downarrow M$$

$$Then UB(T \vdash P) \equiv \{Q \mid T \vdash Q \geqslant P\}.$$

Lemma 70 (Characterization of the Normalized Supertypes). For a normalized positive type P = nf(P), let us define the set of normalized upper bounds in the following way:

```
T \vdash P \qquad \qquad \mathsf{NFUB}(T \vdash P)
T \vdash \beta^{+} \qquad \qquad \{\beta^{+}\}
T \vdash \exists \overrightarrow{\beta^{-}} . P \qquad \qquad \mathsf{NFUB}(T, \overrightarrow{\beta^{-}} \vdash P) \ \textit{not using } \overrightarrow{\beta^{-}}
T \vdash \downarrow M \qquad \left\{ \exists \overrightarrow{\alpha^{-}} . \downarrow M' \mid for \overrightarrow{\alpha^{-}}, M', and \overrightarrow{N} \ \textit{s.t.} \ \mathsf{ord} \overrightarrow{\alpha^{-}} \ \mathsf{in} \ M' = \overrightarrow{\alpha^{-}}, \\ T \vdash N_{i}, T, \overrightarrow{\alpha^{-}} \vdash M', and [\overrightarrow{N}/\overrightarrow{\alpha^{-}}] \downarrow M' = \downarrow M \right\}
Then \ \mathsf{NFUB}(T \vdash P) \equiv \{\mathsf{nf}(Q) \mid T \vdash Q \geqslant P\}.
```

Lemma 71. Upper bounds of a type do not depend on the context as soon as the type is well-formed in it.

```
If T_1 \vdash P and T_2 \vdash P then \mathsf{UB}(T_1 \vdash P) = \mathsf{UB}(T_2 \vdash P) and \mathsf{NFUB}(T_1 \vdash P) = \mathsf{NFUB}(T_2 \vdash P)
```

Lemma 72 (Soundness of the Least Upper Bound). For types $T \vdash P_1$, and $T \vdash P_2$, if $T \models P_1 \lor P_2 = Q$ then

(i)
$$T \vdash O$$

```
(ii) T \vdash Q \geqslant P_1 and T \vdash Q \geqslant P_2
```

Lemma 73 (Completeness and Initiality of the Least Upper Bound). For types $T \vdash P_1$, $T \vdash P_2$, and $T \vdash Q$ such that $T \vdash Q \geqslant P_1$ and $T \vdash Q \geqslant P_2$, there exists Q' s.t. $T \models P_1 \lor P_2 = Q'$ and $T \vdash Q \geqslant Q'$.

7.9 Upgrade

Observation 8 (Upgrade determinism). Assuming P is well-formed in $T \subseteq \Theta$, if upgrade $T \vdash P$ to $\Theta = Q$ and upgrade $T \vdash P$ to $\Theta = Q'$ are defined then Q = Q'.

Lemma 74 (Soundness of Upgrade). Assuming P is well-formed in $T = \Theta, \overrightarrow{\alpha^{\pm}}$, if upgrade $T \vdash P$ to $\Theta = Q$ then

- (1) $\Theta \vdash Q$
- (2) $T \vdash Q \geqslant P$

Lemma 75 (Completeness and Initiality of Upgrade). The upgrade returns the least T-supertype of P well-formed in Θ . Assuming P is well-formed in $T = \Theta$, $\overrightarrow{\alpha^{\pm}}$, For any Q' such that

- (1) $\Theta \vdash Q'$ and
- (2) $T \vdash Q' \geqslant P$,

The result of the upgrade algorithm Q exists (upgrade $T \vdash P$ to $\Theta = Q$) and satisfies $\Theta \vdash Q' \geqslant Q$.

7.10 Constraint Satisfaction

Lemma 76 (Any constraint is satisfiable). Suppose that $\Sigma \vdash C$ and Υ is a set such that $\mathbf{dom}(C) \subseteq \Upsilon \subseteq \mathbf{dom}(\Sigma)$. Then there exists $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : \Upsilon$ and $\Sigma \vdash \widehat{\sigma} : C$.

Lemma 77 (Constraint Entry Satisfaction is Stable under Equivalence).

```
- If T \vdash N_1 : e and T \vdash N_1 \simeq^{\leqslant} N_2 then T \vdash N_2 : e.
+ If T \vdash P_1 : e and T \vdash P_1 \simeq^{\leqslant} P_2 then T \vdash P_2 : e.
```

Corollary 28 (Constraint Satisfaction is stable under Equivalence).

```
If \Sigma \vdash \widehat{\sigma}_1 : C and \Sigma \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : \mathbf{dom}(C) then \Sigma \vdash \widehat{\sigma}_2 : C;
if \Sigma \vdash \widehat{\sigma}_1 : UC and \Sigma \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : \mathbf{dom}(C) then \Sigma \vdash \widehat{\sigma}_2 : UC.
```

Corollary 29 (Normalization preserves Constraint Satisfaction).

```
If \Sigma \vdash \widehat{\sigma} : C then \Sigma \vdash \mathbf{nf}(\widehat{\sigma}) : C;
if \Sigma \vdash \widehat{\sigma} : UC then \Sigma \vdash \mathbf{nf}(\widehat{\sigma}) : UC.
```

7.11 Positive Subtyping

Observation 9 (Positive Subtyping is Deterministic). For fixed T, Σ , P, and Q, if T; $\Sigma \models P \geqslant Q \Rightarrow C$ and T; $\Sigma \models P \geqslant Q \Rightarrow C'$ then C = C'.

Lemma 78 (Soundness of the Positive Subtyping). If $T \vdash^{\supseteq} \Sigma$, $T \vdash Q$, T; $\mathbf{dom}(\Sigma) \vdash P$, and T; $\Sigma \models P \geqslant Q \dashv C$, then $\Sigma \vdash C$: $\mathbf{uv} P$ and for any normalized $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : C$, $T \vdash [\widehat{\sigma}] P \geqslant Q$.

Lemma 79 (Completeness of the Positive Subtyping). Suppose that $T \vdash^{\supseteq} \Sigma, T \vdash Q$ and $T ; \mathbf{dom}(\Sigma) \vdash P$. Then for any $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(P)$ such that $T \vdash [\widehat{\sigma}]P \geqslant Q$, there exists $T ; \Sigma \vdash P \geqslant Q \dashv C$ and moreover, $\Sigma \vdash \widehat{\sigma} : C$.

7.12 Subtyping Constraint Merge

Observation 10 (Positive Subtyping is Deterministic). For fixed T, Σ , P, and Q, if T; $\Sigma \models P \geqslant Q \Rightarrow C$ and T; $\Sigma \models P \geqslant Q \Rightarrow C'$ then C = C'.

Observation 11 (Constraint Entry Merge is Deterministic). For fixed T, e_1 , e_2 , if $T \vdash e_1 \& e_2 = e$ and $T \vdash e_1 \& e_2 = e'$ then e = e'.

Observation 12 (Subtyping Constraint Merge is Deterministic). Suppose that $\Sigma \vdash C_1$ and $\Sigma \vdash C_2$ If $\Sigma \vdash C_1 \& C_2 = C$ and $\Sigma \vdash C_1 \& C_2 = C'$ are defined then C = C'.

Lemma 80 (Soundness of Constraint Entry Merge). For a fixed context T, suppose that $T \vdash e_1$ and $T \vdash e_2$. If $T \vdash e_1 \& e_2 = e$ is defined then

(1) $T \vdash e$

(2) For any $T \vdash P$, $T \vdash P$: e implies $T \vdash P$: e_1 and $T \vdash P$: e_2

Lemma 81 (Soundness of Constraint Merge). Suppose that $\Sigma \vdash C_1 : \Upsilon_1$ and $\Sigma \vdash C_2 : \Upsilon_2$ and $\Sigma \vdash C_1 \& C_2 = C$ is defined. Then

- (1) $\Sigma \vdash C : \Upsilon_1 \cup \Upsilon_2$,
- (2) for any substitution $\Sigma \vdash \widehat{\sigma} : \Upsilon_1 \cup \Upsilon_2, \Sigma \vdash \widehat{\sigma} : C \text{ implies } \Sigma \vdash \widehat{\sigma} : C_1 \text{ and } \Sigma \vdash \widehat{\sigma} : C_2.$

Lemma 82 (Completeness of Constraint Entry Merge). For a fixed context T, suppose that $T \vdash e_1$ and $T \vdash e_2$ are matching constraint entries.

- for a type P such that $T \vdash P : e_1$ and $T \vdash P : e_2$, $T \vdash e_1 \& e_2 = e$ is defined and $T \vdash P : e$.
- for a type N such that $T \vdash N : e_1$ and $T \vdash N : e_2$, $T \vdash e_1 \& e_2 = e$ is defined and $T \vdash N : e$.

Lemma 83 (Completeness of Constraint Merge). Suppose that $\Sigma \vdash C_1 : \Upsilon_1$ and $\Sigma \vdash C_2 : \Upsilon_2$. If there exists a substitution $\Sigma \vdash \widehat{\sigma} : \Upsilon_1 \cup \Upsilon_2$ such that $\Sigma \vdash \widehat{\sigma} : C_1$ and $\Sigma \vdash \widehat{\sigma} : C_2$ then $\Sigma \vdash C_1 \& C_2 = C$ is defined.

7.13 Negative Subtyping

Observation 13 (Negative Algorithmic Subtyping is Deterministic). For fixed T, Σ , M, and N, if T; $\Sigma \models N \leqslant M \Rightarrow C$ and T; $\Sigma \models N \leqslant M \Rightarrow C'$ then C = C'.

Lemma 84 (Soundness of Negative Subtyping). If $T \vdash^{\supseteq} \Sigma$, $T \vdash M$, T; $\mathbf{dom}(\Sigma) \vdash N$ and T; $\Sigma \vdash N \leq M = C$, then $\Sigma \vdash C : \mathbf{uv}(N)$ and for any normalized $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : C$, $T \vdash [\widehat{\sigma}] N \leq M$.

Lemma 85 (Completeness of the Negative Subtyping). Suppose that $T \vdash^{\supseteq} \Sigma$, $T \vdash M$, T; **dom** $(\Sigma) \vdash N$, and N does not contain negative unification variables $(\widehat{\alpha}^{-} \notin \mathbf{uv} \ N)$. Then for any $\Sigma \vdash \widehat{\sigma} : \mathbf{uv} \ (N)$ such that $T \vdash [\widehat{\sigma}] N \leqslant M$, there exists T; $\Sigma \models N \leqslant M \rightrightarrows C$ and moreover, $\Sigma \vdash \widehat{\sigma} : C$.

7.14 Singularity

Lemma 86 (Soundness of Entry Singularity).

- + Suppose e singular with P for P well-formed in T. Then $T \vdash P$: e and for any $T \vdash P'$ such that $T \vdash P'$: e, $T \vdash P' \simeq^{\leqslant} P$;
- Suppose e singular with N for N well-formed in T. Then $T \vdash N :$ e and for any $T \vdash N'$ such that $T \vdash N' :$ e, $T \vdash N' \simeq^{\leq} N$.

Lemma 87 (Completeness of Entry Singularity).

- Suppose that there exists N well-formed in T such that for any N' well-formed in T, $T \vdash N' : e$ implies $T \vdash N' \simeq^{\leq} N$. Then e singular with nf (N).
- + Suppose that there exists P well-formed in T such that for any P' well-formed in T, $T \vdash P' : e$ implies $T \vdash P' \simeq^{\leq} P$. Then e singular with nf (P).

Lemma 88 (Soundness of Singularity). Suppose $\Sigma \vdash C : \Upsilon$, and C singular with $\widehat{\sigma}$. Then $\Sigma \vdash \widehat{\sigma} : \Upsilon$. $\Sigma \vdash \widehat{\sigma} : C$ and for any $\widehat{\sigma}'$ such that $\Sigma \vdash \widehat{\sigma} : C, \Sigma \vdash \widehat{\sigma}' \simeq \widehat{\sigma} : \Upsilon$.

Observation 14 (Singularity is Deterministic). For a fixed C such that $\Sigma \vdash C : \Upsilon$, if C singular with $\widehat{\sigma}$ and C singular with $\widehat{\sigma}'$, then $\widehat{\sigma} = \widehat{\sigma}'$.

Lemma 89 (Completeness of Singularity). For a given $\Sigma \vdash C$, suppose that all the substitutions satisfying C are equivalent on $\Upsilon\supseteq\mathbf{dom}\,(C)$. In other words, suppose that there exists $\Sigma\vdash\widehat{\sigma}_1:\Upsilon$ such that for any $\Sigma \vdash \widehat{\sigma} : \Upsilon, \Sigma \vdash \widehat{\sigma} : C$ implies $\Sigma \vdash \widehat{\sigma} \simeq^{\leq} \widehat{\sigma}_1 : \Upsilon$. Then

- C singular with $\widehat{\sigma}_0$ for some $\widehat{\sigma}_0$ and
- • Y = dom (C).

7.15 Correctness of the Typing Algorithm

Lemma 90 (Determinicity of typing algorithm). Suppose that $T \vdash \Gamma$ and $T \vdash^{\supseteq} \Sigma$. Then

- + If $T; \Gamma \models v : P$ and $T; \Gamma \models v : P'$ then P = P'.
- If T; $\Gamma \models c$: N and T; $\Gamma \models c$: N' then N = N'.
- If $T : \Gamma : \Sigma \models N \bullet \overrightarrow{v} \implies M = \Sigma' : C \text{ and } T : \Gamma : \Sigma \models N \bullet \overrightarrow{v} \implies M' = \Sigma' : C' \text{ then } M = M'$ $\Sigma = \Sigma'$, and C = C'.

Lemma 91 (Soundness of typing). *Suppose that* $T \vdash \Gamma$. *For an inference tree* T_1 ,

- + If T_1 infers T; $\Gamma \models \nu$: P then $T \vdash P$ and T; $\Gamma \vdash \nu$: P
- If T_1 infers T; $\Gamma \models c$: N then $T \vdash N$ and T; $\Gamma \vdash c$: N
- If T_1 infers $T : \Gamma : \Sigma \models N \bullet \overrightarrow{v} \implies M = \Sigma' : C$ for $T \vdash^{\supseteq} \Sigma$ and $T : \mathbf{dom}(\Sigma) \vdash N$ free from negative algorithmic variables, then
 - (1) $T \vdash^{\supseteq} \Sigma'$
 - (2) $\Sigma \subseteq \Sigma'$
 - (3) T; dom $(\Sigma') \vdash M$
 - (4) $\operatorname{dom}(\Sigma) \cap \operatorname{uv}(M) \subseteq \operatorname{uv} N$
 - (5) M is normalized and free from negative algorithmic variables
 - (6) $\Sigma'|_{\mathbf{uv} \ \mathbf{N} \cup \mathbf{uv} \ \mathbf{M}} \vdash C$
 - (7) for any $\Sigma' \vdash \widehat{\sigma} : \mathbf{uv} \ \underline{N} \cup \mathbf{uv} \ \underline{M}, \ \Sigma' \vdash \widehat{\sigma} : C \text{ implies } T ; \Gamma \vdash [\widehat{\sigma}] \ \underline{N} \bullet \overrightarrow{v} \implies [\widehat{\sigma}] \ \underline{M}$

Lemma 92 (Completeness of Typing). Suppose that $T \vdash \Gamma$. For an inference tree T_1 ,

- + If T_1 infers $T; \Gamma \vdash \nu : P$ then $T; \Gamma \models \nu : \mathbf{nf}(P)$
- If T_1 infers T; $\Gamma \vdash c : N$ then T; $\Gamma \models c : \mathbf{nf}(N)$
- If T_1 infers $T : \Gamma \vdash [\widehat{\sigma}] N \bullet \overrightarrow{v} \implies M$ and
 - (1) $T \vdash^{\supseteq} \Sigma$,
 - (2) $T \vdash M$,
 - (3) $T : \mathbf{dom}(\Sigma) \vdash \mathbf{N}$ (free from negative algorithmic variables, that is $\widehat{\alpha}^- \notin \mathbf{uv} \mathbf{N}$), and
 - (4) $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(N)$,
 - then there exist M', Σ' , and C such that

```
(1) T : \Gamma : \Sigma \models N \bullet \overrightarrow{v} \implies M' = \Sigma' : C and
1961
                     (2) for any \Sigma \vdash \widehat{\sigma} : \mathbf{uv}(N) and T \vdash M such that T ; \Gamma \vdash [\widehat{\sigma}] N \bullet \overrightarrow{v} \implies M, there exists \widehat{\sigma}'
1962
                           such that
1963
                              (a) \Sigma' \vdash \widehat{\sigma}' : \mathbf{uv} \ N \cup \mathbf{uv} \ M \ and \ \Sigma' \vdash \widehat{\sigma}' : C,
1964
                              (b) \Sigma \vdash \widehat{\sigma}' \simeq \widehat{\sigma} : \mathbf{uv} \ \mathbf{N}, and

2006

2007

2008 2009 + $T, T_1 \vdash P$ implies $T, T_2 \vdash [\sigma]P$, and

 $-T, T_1 \vdash N \text{ implies } T, T_2 \vdash [\sigma] N$

Vol. 1, No. 1, Article Publication date: November 2023.

PROOF. We prove it by induction on T, $T_1 \vdash P$ and mutually, on T, $T_1 \vdash N$. Let us consider the last rule used in the derivation.

Case 1. (VAR₊^{WF}), i.e. P is α^+ . By inversion, $\alpha^+ \in T$, T_1 , then

- if $\alpha^+ \in T_1$ then $T_2 \vdash [\sigma] \alpha^+$, and by weakening (corollary 2), $T, T_2 \vdash [\sigma] \alpha^+$;
- if $\alpha^+ \in T \setminus T_1$ then $[\sigma]\alpha^+ = \alpha^+$, and by (VAR_+^{WF}) , $T, T_2 \vdash \alpha^+$.

Case 2. (\uparrow^{WF}) , i.e. P is $\downarrow N$.

Then $T, T_1 \vdash \ \ N$ means $T, T_1 \vdash \ N$ by inversion, and by the induction hypothesis, $T, T_2 \vdash \ [\sigma]N$. Then by $(\uparrow^{WF}), T, T_2 \vdash \ \ [\sigma]N$, which by definition of substitution is rewritten as $T, T_2 \vdash \ [\sigma] \ \ N$.

Case 3. (\exists^{WF}) , i.e. P is $\exists \overrightarrow{\alpha}$. Q.

Then $T, T_1 \vdash \exists \overrightarrow{\alpha}^-$. Q means $T, \overrightarrow{\alpha}^-, T_1 \vdash Q$ by inversion, and by the induction hypothesis, $T, \overrightarrow{\alpha}^-, T_2 \vdash [\sigma]Q$. Then by $(\exists^{WF}), T, \overrightarrow{\alpha}^-, T_2 \vdash \exists \overrightarrow{\alpha}^-$. $[\sigma]Q$, which by definition of substitution is rewritten as $T, T_2 \vdash [\sigma]\exists \overrightarrow{\alpha}^-$. Q.

Case 4. The negative cases are proved symmetrically.

8.2 Substitution

Lemma 4 (Substitution strengthening). Restricting the substitution to the free variables of the substitution subject does not affect the result. Suppose that σ is a substitution, P and N are types. Then

- $+ [\sigma]_P = [\sigma|_{\text{fv}\,P}]_P,$
- $[\sigma]N = [\sigma|_{\text{fv}\,N}]N$

PROOF. First, we strengthen the statement by saying that one can restrict the substitution to an arbitrary superset of the free variables of the substitution subject:

- + $[\sigma]P = [\sigma|_{vars}]P$, for any $vars \supseteq \mathbf{fv}P$, and
- [σ] $N = [σ|_{vars}]N$, for any vars ⊇fv N.

Then the proof is a straightforward induction on P and mutually, on N. For the base cases:

Case 1. $N = \alpha^-$

Then $[\sigma]\alpha^- = \sigma|_{vars}(\alpha^-)$ by definition, since $\alpha^- \in \text{fv }\alpha^- \subseteq vars$.

Case 2. $N = P \rightarrow M$

Then $[\sigma](P \to M) = [\sigma]P \to [\sigma]M$ by definition. Since $\text{fv }P \subseteq \text{fv }(P \to M) \subseteq \text{vars}$, the induction hypothesis is applicable to $[\sigma]P : [\sigma]P = [\sigma|_{vars}]P$. Analogously, and $[\sigma]M = [\sigma|_{vars}]M$. Then $[\sigma](P \to M) = [\sigma|_{vars}]P \to [\sigma|_{vars}]M = [\sigma|_{vars}](P \to M)$.

Case 3. $N = \uparrow P$ is proved analogously to the previous case.

Case 4. $N = \forall \overrightarrow{\alpha^+}$. M (where $\overrightarrow{\alpha^+}$ is not empty)

Then $[\sigma] \forall \overrightarrow{\alpha^+}$. $M = \forall \overrightarrow{\alpha^+}$. $[\sigma] M$ by definition. Let us assume $\overrightarrow{\alpha^+}$ are fresh variables, it means that $\sigma(\alpha^{\pm}) = \alpha^{\pm}$ for any $\alpha^{\pm} \in \overrightarrow{\alpha^+}$, and thus, $[\sigma|_{vars}] = [\sigma|_{(vars \cup \overrightarrow{\alpha^+})}]$ immediately from the definition.

Since $vars \subseteq \mathbf{fv}$ $(\forall \alpha^{+}, M) = \mathbf{fv} \ M \setminus \overrightarrow{\alpha^{+}}, vars \cup \overrightarrow{\alpha^{+}} \subseteq \mathbf{fv} \ (M)$. Then by the induction hypothesis $[\sigma]M = [\sigma|_{(vars \cup \overrightarrow{\alpha^{+}})}]M$. Finally, $[\sigma]\forall \overrightarrow{\alpha^{+}}, M = \forall \overrightarrow{\alpha^{+}}, [\sigma|_{(vars \cup \overrightarrow{\alpha^{+}})}]M = \forall \overrightarrow{\alpha^{+}}, [\sigma|_{vars}]M = [\sigma|_{vars}]\forall \overrightarrow{\alpha^{+}}, M$.

Case 5. The positive cases are proves symmetrically.

Lemma 5 (Signature of a restricted substitution). If $T_2 \vdash \sigma : T_1$ then $T_2 \vdash \sigma|_{vars} : T_1 \cap vars$.

PROOF. Let us take an arbitrary $\alpha^{\pm} \in T_1 \cap vars$. Since $\alpha^{\pm} \in T_1$, $T_2 \vdash [\sigma]\alpha^{\pm}$ by the signature of σ Let us take an arbitrary $\alpha^{\pm} \notin T_1 \cap vars$. If $\alpha^{\pm} \notin vars$ then $[\sigma|_{vars}]\alpha^{\pm} = \alpha^{\pm}$ by definition of restriction. If $\alpha^{\pm} \in vars \setminus T_1$ then $[\sigma|_{vars}]\alpha^{\pm} = [\sigma]\alpha^{\pm}$ by definition and $[\sigma]\alpha^{\pm} = \alpha^{\pm}$ by the signature of σ .

Lemma 6. Suppose that σ is a substitution with signature $T_2 \vdash \sigma : T_1$. Then if vars is disjoint from T_1 , then $\sigma|_{vars} = id$.

PROOF. Let us take an arbitrary α^{\pm} . If $\alpha^{\pm} \notin vars$ then $[\sigma|_{vars}]\alpha^{\pm} = \alpha^{\pm}$ by definition.

If $\alpha^{\pm} \in vars$ then $\alpha^{\pm} \notin T_1$ by assumption. Then $[\sigma|_{vars}]\alpha^{\pm} = [\sigma]\alpha^{\pm}$ by definition of restricted substitution, and since $T_2 \vdash \sigma : T_1$, we have $[\sigma]\alpha^{\pm} = \alpha^{\pm}$.

Corollary 3 (Application of a disjoint substitution). *Suppose that* σ *is a substitution with signature* $T_2 \vdash \sigma : T_1$. *Then*

```
+ if T_1 \cap \mathbf{fv}(Q) = \emptyset then [\sigma]Q = Q;
```

- $if T_1 \cap \mathbf{fv}(N) = \emptyset \ then \ [\sigma]N = N.$

Lemma 7 (Substitution range weakening). Suppose that $T_2 \subseteq T_2'$ are contexts and σ is a substitution. Then $T_2 \vdash \sigma : T_1$ implies $T_2' \vdash \sigma : T_1$.

PROOF. For any $\alpha^{\pm} \in T_1$, $T_2 \vdash \sigma : T_1$ gives us $T_2 \vdash [\sigma]\alpha^{\pm}$, which can be weakened to $T_2' \vdash [\sigma]\alpha^{\pm}$ by corollary 2. This way, $T_2' \vdash \sigma : T_1$.

Lemma 8 (Substitutions Equivalent on Free Variables). Suppose that $T' \subseteq T$, σ_1 and σ_2 are substitutions of signature $T \vdash \sigma_i : T'$. Then

```
+ for a type T \vdash P, if T \vdash [\sigma_1]P \simeq^{\leqslant} [\sigma_2]P then T \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \mathbf{fv} P \cap T';

- for a type T \vdash N, if T \vdash [\sigma_1]N \simeq^{\leqslant} [\sigma_2]N then T \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \mathbf{fv} N \cap T'.
```

PROOF. Let us make an additional assumption that σ_1 , σ_2 , and the mentioned types are normalized If they are not, we normalize them first.

Notice that the normalization preserves the set of free variables (lemma 38), well-formedness (corollary 14), and equivalence (lemma 46), and distributes over substitution (lemma 41). This way, the assumed and desired properties are equivalent to their normalized versions.

We prove it by induction on the structure of P and mutually, N. Let us consider the shape of this type.

```
Case 1. P = \alpha^+ \in T'. Then T \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \text{fv } P \cap T' \text{ means } T \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \alpha^+, \text{ i.e.} T \vdash [\sigma_1]\alpha^+ \simeq^{\leqslant} [\sigma_2]\alpha^+, \text{ which holds by assumption.}
```

Case 2. $P = \alpha^+ \in T \setminus T'$. Then fv $P \cap T' = \emptyset$, so $T \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \text{fv } P \cap T'$ holds vacuously.

- (1) N is normalized,
- (2) $T \vdash N$ by inversion of $T \vdash \bigcup N$,
- (3) $T \vdash [\sigma_1]N \simeq^{\leqslant} [\sigma_2]N$ holds by inversion of $T \vdash [\sigma_1] \downarrow N \simeq^{\leqslant} [\sigma_2] \downarrow N$, i.e. $T \vdash \downarrow [\sigma_1]N \simeq^{\leqslant} \downarrow [\sigma_2]N$.

Case 4. $P = \exists \overrightarrow{\alpha}$. *Q* Then the induction hypothesis is applicable to type *Q* well-formed in context $T, \overrightarrow{\alpha}$:

- (1) $T' \subseteq T$, $\overrightarrow{\alpha}$ since $T' \subseteq T$,
- (2) $T, \overrightarrow{\alpha} \vdash \sigma_i : T'$ by weakening,
- (3) *Q* is normalized,
- (4) $T, \overrightarrow{\alpha} + Q$ by inversion of $T + \exists \overrightarrow{\alpha} = Q$.

(5) Notice that $[\sigma_i] \exists \overrightarrow{\alpha}$. Q is normalized, and thus, $[\sigma_1] \exists \overrightarrow{\alpha}$. $Q \simeq^D [\sigma_2] \exists \overrightarrow{\alpha}$. Q implies $[\sigma_1] \exists \overrightarrow{\alpha}$. $Q = [\sigma_2] \exists \overrightarrow{\alpha}$. Q (by lemma 46).). This equality means $[\sigma_1] Q = [\sigma_2] Q$, which implies $T \vdash [\sigma_1] Q \simeq^c [\sigma_2] Q$.

Case 5. $N = P \rightarrow M$

Lemma 9 (Substitution composition well-formedness). If $T'_1 \vdash \sigma_1 : T_1$ and $T'_2 \vdash \sigma_2 : T_2$, then $T'_1, T'_2 \vdash \sigma_2 \circ \sigma_1 : T_1, T_2$.

PROOF. By definition of composition.

Lemma 10 (Substitution monadic composition well-formedness). *If* $T'_1 \vdash \sigma_1 : T_1$ *and* $T'_2 \vdash \sigma_2 : T_2$, *then* $T'_2 \vdash \sigma_2 \ll \sigma_1 : T_1$.

PROOF. By definition of monadic composition.

Lemma 11 (Substitution composition). If $T_1' \vdash \sigma_1 : T_1, T_2' \vdash \sigma_2 : T_2, T_1 \cap T_2' = \emptyset$ and $T_1 \cap T_2 = \emptyset$ then $\sigma_2 \circ \sigma_1 = (\sigma_2 \ll \sigma_1) \circ \sigma_2$.

Proof.

- (1) Suppose that $\alpha^{\pm} \in T_1$ then $\alpha^{\pm} \notin T_2$, and thus, $[(\sigma_2 \ll \sigma_1) \circ \sigma_2] \alpha^{\pm} = [(\sigma_2 \ll \sigma_1)] \alpha^{\pm} = [\sigma_2] [\sigma_1] \alpha^{\pm} = [(\sigma_2 \circ \sigma_1)] \alpha^{\pm}$.
- (2) Suppose that $\alpha^{\pm} \notin T_1$ then $[(\sigma_2 \circ \sigma_1)]\alpha^{\pm} = [\sigma_2]\alpha^{\pm}$. Then
 - (a) if $\alpha^{\pm} \notin T_2$ then $[\sigma_2]\alpha^{\pm} = \alpha^{\pm}$ and $[(\sigma_2 \ll \sigma_1) \circ \sigma_2]\alpha^{\pm} = [(\sigma_2 \ll \sigma_1)][\sigma_2]\alpha^{\pm} = [\sigma_2 \ll \sigma_1]\alpha^{\pm} = \alpha^{\pm}$
 - (b) if $\alpha^{\pm} \in T_2$ then $T_2' \vdash [\sigma_2]\alpha^{\pm}$, and hence, $[(\sigma_2 \ll \sigma_1) \circ \sigma_2]\alpha^{\pm} = [(\sigma_2 \ll \sigma_1)][\sigma_2]\alpha^{\pm} = [\sigma_2]\alpha^{\pm}$ by definition of monadic composition, since none of the free variables of $[\sigma_2]\alpha^{\pm}$ is in T_1 .

Corollary 4 (Substitution composition commutativity). If $T_1' \vdash \sigma_1 : T_1, T_2' \vdash \sigma_2 : T_2$, and $T_1 \cap T_2 = \emptyset$, $T_1 \cap T_2' = \emptyset$, and $T_1' \cap T_2 = \emptyset$ then $\sigma_2 \circ \sigma_1 = \sigma_1 \circ \sigma_2$.

PROOF. by lemma 11, $\sigma_2 \circ \sigma_1 = (\sigma_2 \ll \sigma_1) \circ \sigma_2$. Since the codomain of σ_1 is T'_1 , and it is disjoint with the domain of σ_2 , $\sigma_2 \ll \sigma_1 = \sigma_1$.

Lemma 12 (Substitution domain weakening). If $T_2 \vdash \sigma : T_1$ then $T_2, T' \vdash \sigma : T_1, T'$

PROOF. If the variable α^{\pm} is in T_1 then $T_2 \vdash [\sigma]\alpha^{\pm}$ by assumption, and then $T_2, T' \vdash [\sigma]\alpha^{\pm}$ by weakening. If the variable α^{\pm} is in $T' \setminus T_1$ then $[\sigma]\alpha^{\pm} = \alpha^{\pm} \in T' \subseteq T_2, T'$, and thus, $T_2, T' \vdash \alpha^{\pm}$. \square

Lemma 13 (Free variables after substitution). Suppose that $T_2 \vdash \sigma : T_1$, then

- + for a type P, the free variables of $[\sigma]P$ are bounded in the following way: $\mathbf{fv}(P) \setminus T_1 \subseteq \mathbf{fv}([\sigma]P) \subseteq (\mathbf{fv}(P) \setminus T_1) \cup T_2$;
- for a type N, the free variables of $[\sigma]^{\mathbf{P}}$ are bounded in the following way: $\mathbf{fv}(N) \setminus T_1 \subseteq \mathbf{fv}([\sigma]N) \subseteq (\mathbf{fv}(N) \setminus T_1) \cup T_2$.

PROOF. We prove it by structural induction on P and mutually, on N.

If $\alpha^+ \notin T_1$ then $[\sigma]\alpha^+ = \alpha^+$, and fv $([\sigma]\alpha^+) = \alpha^+ = \alpha^+ \setminus T_1$

```
Case 1. P = \alpha^+

If \alpha^+ \in T_1 then T_2 \vdash [\sigma] \alpha^+, and by lemma 1, \mathbf{fv}([\sigma] \alpha^+) \subseteq T_2. \mathbf{fv}(\alpha^+) \setminus T_1 = \emptyset, so \mathbf{fv}([\sigma] P) \setminus T_1 \subseteq \mathbf{fv}([\sigma] \alpha^+) vacuously.
```

Case 2. $P = \exists \overrightarrow{\alpha}$. Q

Then we need to show that $\mathbf{fv}([\sigma]P) = \mathbf{fv}([\sigma]Q) \setminus \overrightarrow{\alpha}$ is a subset of $(\mathbf{fv}(P) \setminus T_1) \cup T_2$ and a superset of $\mathbf{fv}(P) \setminus T_1$. Notice that $\mathbf{fv}(P) = \mathbf{fv}(Q) \setminus \overrightarrow{\alpha}$ by definition. This way, we need to show that $\mathbf{fv}(Q) \setminus \overrightarrow{\alpha} \setminus T_1 \subseteq \mathbf{fv}([\sigma]Q) \setminus \overrightarrow{\alpha} \subseteq (\mathbf{fv}(Q) \setminus \overrightarrow{\alpha} \setminus T_1) \cup T_2$,

By the induction hypothesis, $\mathbf{fv}([\sigma]Q) \subseteq (\mathbf{fv}(Q) \setminus T_1) \cup T_2$. So for the second inclusion, it suffices to show that $((\mathbf{fv}(Q) \setminus T_1) \cup T_2) \setminus \overrightarrow{\alpha} \subseteq (\mathbf{fv}(Q) \setminus \overrightarrow{\alpha} \setminus T_1) \cup T_2$, which holds by set theoretical reasoning.

Also by the induction hypothesis, $\mathbf{fv}(Q) \setminus T_1 \subseteq \mathbf{fv}([\sigma]Q)$, and thus, by subtracting $\overrightarrow{\alpha}$ from both sides, $\mathbf{fv}(Q) \setminus \overrightarrow{\alpha} \setminus T_1 \subseteq \mathbf{fv}([\sigma]Q) \setminus \overrightarrow{\alpha}$.

Case 3. The case $N = \forall \alpha^{f}$. M is proved analogously.

Case 4. $N = P \rightarrow M$

Then $\operatorname{fv}([\sigma]N) = \operatorname{fv}([\sigma]P) \cup \operatorname{fv}([\sigma]M)$. By the induction hypothesis,

- (1) $\mathbf{fv}(P) \setminus T_1 \subseteq \mathbf{fv}([\sigma]P) \subseteq (\mathbf{fv}(P) \setminus T_1) \cup T_2$ and
- (2) $\mathbf{fv}(M) \setminus T_1 \subseteq \mathbf{fv}([\sigma]M) \subseteq (\mathbf{fv}(M) \setminus T_1) \cup T_2$.

We unite these inclusions vertically and obtain $\mathbf{fv}(P) \setminus T_1 \cup \mathbf{fv}(M) \setminus T_1 \subseteq \mathbf{fv}([\sigma]N) \subseteq ((\mathbf{fv}(P) \setminus T_1) \cup T_2) \cup ((\mathbf{fv}(M) \setminus T_1) \cup T_2), \text{ which is equivalent to } (\mathbf{fv}(P) \cup \mathbf{fv}(M)) \setminus T_1 \subseteq \mathbf{fv}([\sigma]N) \subseteq (\mathbf{fv}(P) \cup \mathbf{fv}(M)) \setminus T_1 \cup T_2. \text{ Since } \mathbf{fv}(P) \cup \mathbf{fv}(M) = \mathbf{fv}(N), \mathbf{fv}(N) \setminus T_1 \subseteq \mathbf{fv}([\sigma]N) \subseteq (\mathbf{fv}(N) \setminus T_1) \cup T_2.$

Case 5. The cases when $P = \downarrow M$ and $N = \uparrow Q$ are proved analogously

Lemma 14 (Free variables of a variable image). Suppose that σ is an arbitrary substitution, Then

- + $if \alpha^{\pm} \in fv(P)$ then $fv([\sigma]\alpha^{\pm}) \subseteq fv([\sigma]P)$,
- if α^{\pm} ∈ fv (N) then fv ([σ] α^{\pm}) ⊆ fv ([σ]N).

PROOF. By mutual induction on P and N. The base cases (when P or N is a variable) are trivial, since then $\alpha^{\pm} \in \text{fv}(P)$ means $\alpha^{\pm} = P$ (and symmetrically for N). The congruent cases (when the type is formed by \downarrow , \uparrow , or \rightarrow) hold since α^{\pm} occurs in type means that it occurs in one of its parts, to which we apply the induction hypothesis.

Let us suppose that the type is $\exists \overrightarrow{\alpha}^{\pm}$. Q. Then $\alpha^{\pm} \in \mathbf{fv} \ (\exists \overrightarrow{\alpha}^{\pm}$. Q) means $\alpha^{\pm} \in \mathbf{fv} \ (Q)$ and $\alpha^{\pm} \notin \overrightarrow{\alpha}^{\pm}$. Then by the induction hypothesis, $\mathbf{fv} \ ([\sigma]\alpha^{\pm}) \subseteq \mathbf{fv} \ ([\sigma]Q)$, and it is left to notice that $\mathbf{fv} \ ([\sigma]\alpha^{\pm}) \cap \overrightarrow{\alpha}^{\pm} = \emptyset$, which we can ensure by alpha-equivalence.

8.3 Declarative Subtyping

Lemma 15 (Free Variable Propagation). In the judgments of negative subtyping or positive supertyping, free variables propagate left to right. For a context T,

```
-ifT \vdash N \leq M then fv(N) \subseteq fv(M)
```

+ $if T \vdash P \ge Q then fv (P) \subseteq fv (Q)$

PROOF. Mutual induction on $T \vdash N \leq M$ and $T \vdash P \geq Q$.

Case 1. $T \vdash \alpha^- \leq \alpha^-$

It is self-evident that $\alpha^- \subseteq \alpha^-$.

Case 2. $T \vdash \uparrow P \leq \uparrow Q$ From the inversion (and unfolding $T \vdash P \simeq^{\varsigma} Q$), we have $T \vdash P \geqslant Q$. Then by the induction hypothesis, $\mathbf{fv}(P) \subseteq \mathbf{fv}(Q)$. The desired inclusion holds, since $\mathbf{fv}(\uparrow P) = \mathbf{fv}(P)$ and $\mathbf{fv}(\uparrow Q) = \mathbf{fv}(Q)$.

Case 3. $T \vdash P \to N \leq Q \to M$ The induction hypothesis applied to the premises gives $\text{fv }(P) \subseteq \text{fv }(Q)$ and $\text{fv }(N) \subseteq \text{fv }(M)$. Then $\text{fv }(P \to N) = \text{fv }(P) \cup \text{fv }(N) \subseteq \text{fv }(Q) \cup \text{fv }(M) = \text{fv }(Q \to M)$.

Case 4. T \vdash \forall \overrightarrow{\alpha^{+}}. N \leq \forall \overrightarrow{\beta^{+}}. M

\mathbf{fv} \forall \overrightarrow{\alpha^{+}}. N \subseteq \mathbf{fv} ([\overrightarrow{P}/\alpha^{+}]N) \setminus \overrightarrow{\beta^{+}} here \overrightarrow{\beta^{+}} is excluded by the premise \mathbf{fv} N \cap \overrightarrow{\beta^{+}} = \emptyset

\subseteq \mathbf{fv} M \setminus \overrightarrow{\beta^{+}}. M by the induction hypothesis, \mathbf{fv} ([\overrightarrow{P}/\alpha^{+}]N) \subseteq \mathbf{fv} M

\subseteq \mathbf{fv} \forall \overrightarrow{\beta^{+}}. M
```

Case 5. The positive cases are symmetric.

Corollary 5 (Free Variables of mutual subtypes).

```
- If T \vdash N \simeq^{\leq} M then \mathbf{fv} N = \mathbf{fv} M,
+ If T \vdash P \simeq^{\leq} Q then \mathbf{fv} P = \mathbf{fv} Q
```

Corollary 6. Suppose that all the types below are well-formed in T and $T' \subseteq T$. Then

```
+ T \vdash P \simeq^{\leq} Q implies T' \vdash P \iff T' \vdash Q
- T \vdash N \simeq^{\leq} M implies T' \vdash N \iff T' \vdash M
```

PROOF. From lemma 2 and corollary 5.

Lemma 16 (Decomposition of quantifier rules). Assuming that $\overrightarrow{\alpha}^+$, $\overrightarrow{\beta}^+$, $\overrightarrow{\alpha}^-$, and $\overrightarrow{\alpha}^-$ are disjoint from T,

```
-_R \ T \vdash N \leq \forall \overrightarrow{\beta^+}. M \ holds \ if \ and \ only \ if \ T, \overrightarrow{\beta^+} \vdash N \leq M;
+_R \ T \vdash P \geqslant \exists \overrightarrow{\beta^-}. Q \ holds \ if \ and \ only \ if \ T, \overrightarrow{\beta^-} \vdash P \geqslant Q;
```

- -L suppose $M \neq \forall ...$ then $T \vdash \forall \alpha^+$. $N \leq M$ holds if and only if $T \vdash [\overrightarrow{P}/\alpha^+]N \leq M$ for some
- $+_L$ suppose $Q \neq \exists ...$ then $T \vdash \exists \overrightarrow{\alpha}^2$. $P \geqslant Q$ holds if and only if $T \vdash [\overrightarrow{N}/\overrightarrow{\alpha}^2]P \geqslant Q$ for some

Proof.

- $-_R$ Let us prove both directions.
 - ⇒ Let us assume $T \vdash N \leq \forall \overrightarrow{\beta^+}$. $M. T \vdash N \leq \forall \overrightarrow{\beta^+}$. M. Let us decompose M as $\forall \overrightarrow{\beta^{+'}}$. M' where M' does not start with \forall , and decompose N as $\forall \overrightarrow{\alpha^+}$. N' where N' does not start with \forall . If $\overrightarrow{\beta^+}$ is empty, then $T, \overrightarrow{\beta^+} \vdash N \leq M$ holds by assumption. Otherwise, $T \vdash \forall \overrightarrow{\alpha^+}$. $N' \leq \forall \overrightarrow{\beta^+}$. $\forall \overrightarrow{\beta^+}$. M is inferred by (\forall^{\leq}) , and by inversion: $T, \overrightarrow{\beta^+}, \overrightarrow{\beta^{+'}} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leq M'$ for some $T, \overrightarrow{\beta^+}, \overrightarrow{\beta^{+'}} \vdash \overrightarrow{P}$. Then again by (\forall^{\leq}) with the same $\overrightarrow{P}, T, \overrightarrow{\beta^+} \vdash \forall \overrightarrow{\alpha^+}$. $N' \leq \forall \overrightarrow{\beta^{+'}}$. M', that is $T, \overrightarrow{\beta^+} \vdash N \leq M$.
 - $= \text{ let us assume } T, \overrightarrow{\beta^+} \vdash N \leqslant M, \text{ and let us decompose } N \text{ as } \forall \overrightarrow{\alpha^+}. N' \text{ where } N' \text{ does not start with } \forall, \text{ and } M \text{ as } \forall \overrightarrow{\beta^{+'}}. M' \text{ where } M' \text{ does not start with } \forall. \text{ if } \overrightarrow{\alpha^+} \text{ and } \overrightarrow{\beta^{+'}} \text{ are empty then } T, \overrightarrow{\beta^+} \vdash N \leqslant M \text{ is turned into } T \vdash N \leqslant \forall \overrightarrow{\beta^+}. M \text{ by } (\forall^{\leqslant}). \text{ Otherwise, } T, \overrightarrow{\beta^+} \vdash \forall \overrightarrow{\alpha^+}. N' \leqslant \forall \overrightarrow{\beta^{+'}}. M' \text{ is inferred by } (\forall^{\leqslant}), \text{ that is } T, \overrightarrow{\beta^+}, \overrightarrow{\beta^{+'}} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leqslant M' \text{ for some } T, \overrightarrow{\beta^+}, \overrightarrow{\beta^{+'}} \vdash \overrightarrow{P}. \text{ Then by } (\forall^{\leqslant}) \text{ again, } T \vdash \forall \overrightarrow{\alpha^+}. N' \leqslant \forall \overrightarrow{\beta^+}, \overrightarrow{\beta^{+'}}. M', \text{ in other words, } T \vdash \forall \overrightarrow{\alpha^+}. N' \leqslant \forall \overrightarrow{\beta^+}. \forall \overrightarrow{\beta^{+'}}. M', \text{ that is } T \vdash N \leqslant \forall \overrightarrow{\beta^+}. M.$
- $-_L$ Suppose $M \neq \forall \dots$ Let us prove both directions.
 - ⇒ Let us assume $T \vdash \forall \overrightarrow{\alpha^+}$. $N \leqslant M$. then if $\overrightarrow{\alpha^+} = \cdot$, $T \vdash N \leqslant M$ holds immediately Otherwise, let us decompose N as $\forall \overrightarrow{\alpha^{+'}}$. N' where N' does not start with \forall . Then $T \vdash \forall \overrightarrow{\alpha^+}$. $\forall \overrightarrow{\alpha^{+'}}$. $N' \leqslant M'$ is inferred by (\forall^{\leqslant}) , and by inversion, there exist $T \vdash \overrightarrow{P}$, $\overrightarrow{P'}$ such that $T \vdash [\overrightarrow{P}/\overrightarrow{\alpha^{+'}}][\overrightarrow{P'}/\overrightarrow{\alpha^{+'}}]N' \leqslant M'$ (the decomposition of substitutions is possible

```
since \alpha^{+} \cap T = \emptyset). Then by (\forall^{\leqslant}) again, T \vdash \forall \alpha^{+'}. [\overrightarrow{P'}/\alpha^{+'}]N' \leqslant M' (notice that [\overrightarrow{P'}/\alpha^{+'}]N' cannot start with \forall).

Example 2256

(\overrightarrow{P'}/\alpha^{+'})N' = \emptyset
cannot start with \forall).

Example 2257

(\overrightarrow{P'}/\alpha^{+'})N' \leqslant M' = \emptyset
where N' does not start with \forall. Then T \vdash [\overrightarrow{P}/\alpha^{+}]\forall \alpha^{+'}. N' \leqslant M' = \emptyset or, equivalently, T \vdash \forall \alpha^{+'}. [\overrightarrow{P}/\alpha^{+}]N' \leqslant M' = \emptyset is inferred by (\forall^{\leqslant}) (notice that [\overrightarrow{P}/\alpha^{+}]N' = \emptyset) cannot start with
```

- where N' does not start with \forall . Then $T \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}] \forall \overrightarrow{\alpha^{+'}}$. $N' \leq M'$ or, equivalently, $T \vdash \forall \overrightarrow{\alpha^{+'}}$. $[\overrightarrow{P}/\overrightarrow{\alpha^{+}}] N' \leq M'$ is inferred by (\forall^{\leq}) (notice that $[\overrightarrow{P}/\overrightarrow{\alpha^{+}}] N'$ cannot start with \forall). By inversion, there exist $T \vdash \overrightarrow{P}'$ such that $T \vdash [\overrightarrow{P}'/\overrightarrow{\alpha^{+'}}] [\overrightarrow{P}/\overrightarrow{\alpha^{+}}] N' \leq M'$. Since $\overrightarrow{\alpha^{+'}}$ is disjoint from the free variables of \overrightarrow{P} and from $\overrightarrow{\alpha^{+}}$, the composition of $\overrightarrow{P}'/\overrightarrow{\alpha^{+'}}$ and $\overrightarrow{P}/\overrightarrow{\alpha^{+}}$ can be joined into a single substitution well-formed in T. Then by (\forall^{\leq}) again, $T \vdash \forall \overrightarrow{\alpha^{+}}$. $N \leq M$.
- + The positive cases are proved symmetrically.

Corollary 7 (Redundant quantifier elimination).

```
-_L Suppose that \overrightarrow{\alpha^+} \cap \mathbf{fv}(N) = \emptyset then T \vdash \forall \overrightarrow{\alpha^+}. N \leqslant M holds if and only if T \vdash N \leqslant M;
```

- $-_R$ Suppose that $\alpha^+ \cap \text{fv}(M) = \emptyset$ then $T \vdash N \leqslant \forall \alpha^+$. M holds if and only if $T \vdash N \leqslant M$;
- $+_L$ Suppose that $\overrightarrow{\alpha} \cap \text{fv}(P) = \emptyset$ then $T \vdash \exists \overrightarrow{\alpha} \cdot P \geqslant Q$ holds if and only if $T \vdash P \geqslant Q$.
- $+_R$ Suppose that $\overrightarrow{\alpha} \cap \mathbf{fv}(Q) = \emptyset$ then $T \vdash P \geqslant \exists \overrightarrow{\alpha}$. Q holds if and only if $T \vdash P \geqslant Q$.

PROOF. $\stackrel{-R}{\longrightarrow}$ Suppose that $\overrightarrow{\alpha^+} \cap \mathbf{fv}(M) = \emptyset$ then by lemma 16, $T \vdash N \leq \forall \overrightarrow{\alpha^+}$. M is equivalent to $T, \overrightarrow{\alpha^+} \vdash N \leq M$, By lemma 2, since $\overrightarrow{\alpha^+} \cap \mathbf{fv}(N) = \emptyset$ and $\overrightarrow{\alpha^+} \cap \mathbf{fv}(M) = \emptyset$, $T, \overrightarrow{\alpha^+} \vdash N \leq M$ is equivalent to $T \vdash N \leq M$.

- Suppose that $\overrightarrow{\alpha^+} \cap \mathbf{fv}(N) = \emptyset$. Let us decompose M as $\forall \overrightarrow{\beta^+}$. M' where M' does not start with \forall . By lemma 16, $T \vdash \forall \overrightarrow{\alpha^+}$. $N \leqslant \forall \overrightarrow{\beta^+}$. M' is equivalent to T, $\overrightarrow{\beta^+} \vdash \forall \overrightarrow{\alpha^+}$. $N \leqslant M'$, which is equivalent to existence of T, $\overrightarrow{\beta^+} \vdash \overrightarrow{P}$ such that T, $\overrightarrow{\beta^+} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N \leqslant M'$. Since $[\overrightarrow{P}/\overrightarrow{\alpha^+}]N = N$, the latter is equivalent to T, $\overrightarrow{\beta^+} \vdash N \leqslant M'$, which is equivalent to $T \vdash N \leqslant \forall \overrightarrow{\beta^+}$. M'. T, $\overrightarrow{\beta^+} \vdash \overrightarrow{P}$ can be chosen arbitrary, for example, $\overrightarrow{P}_i = \exists \alpha^- . \downarrow \alpha^-$.
 - + The positive cases are proved symmetrically.

Lemma 17 (Subtypes and supertypes of a variable). Assuming $T \vdash \alpha^-, T \vdash \alpha^+, T \vdash N$, and $T \vdash P$,

+ $ifT \vdash P \geqslant \exists \overrightarrow{\alpha}$. α^+ or $T \vdash \exists \overrightarrow{\alpha}$. $\alpha^+ \geqslant P$ then $P = \exists \overrightarrow{\beta}$. α^+ (for some potentially empty $\overrightarrow{\beta}$)

- $ifT \vdash N \leqslant \forall \overrightarrow{\alpha}^+$. α^- or $T \vdash \forall \overrightarrow{\alpha}^+$. $\alpha^- \leqslant N$ then $N = \forall \overrightarrow{\beta}^+$. α^- (for some potentially empty $\overrightarrow{\beta}^+$)

PROOF. We prove by induction on the tree inferring $T \vdash P \geqslant \exists \overrightarrow{\alpha}^{-}$. α^{+} or $T \vdash \exists \overrightarrow{\alpha}^{-}$. $\alpha^{+} \geqslant P$ or or $T \vdash N \leqslant \forall \overrightarrow{\alpha}^{+}$. α^{-} or $T \vdash \forall \overrightarrow{\alpha}^{+}$. $\alpha^{-} \leqslant N$.

Let us consider which one of these judgments is inferred.

Case 1. $T \vdash P \geqslant \exists \overrightarrow{\alpha}^+$. α^+

If the size of the inference tree is 1 then the only rule that can infer it is (VAR_+^{\geqslant}) , which implies that $\overrightarrow{\alpha}$ is empty and $P = \alpha^+$.

If the size of the inference tree is > 1 then the last rule inferring it must be (\exists^{\geq}) . By inverting this rule, $P = \exists \overrightarrow{\beta^{\perp}}$. P' where P' does not start with \exists and $T, \overrightarrow{\alpha^{\perp}} \vdash [\overrightarrow{N}/\overrightarrow{\beta^{\perp}}]P' \geqslant \alpha^{+}$ for some $T, \overrightarrow{\alpha^{\perp}} \vdash N_{i}$.

By the induction hypothesis, $[\overrightarrow{N}/\beta^{-}]P' = \exists \overrightarrow{y}^{-}$. α^{+} . What shape can P' have? As mentioned, it does not start with \exists , and it cannot start with \uparrow (otherwise, $[\overrightarrow{N}/\alpha^{-}]P'$ would also start with \uparrow and would not be equal to $\exists \overrightarrow{\beta}^{-}$. α^{+}). This way, P' is a *positive* variable. As such, $[\overrightarrow{N}/\alpha^{-}]P' = P'$, and then $P' = \exists \overrightarrow{\gamma}^{-}$. α^{+} meaning that $\overrightarrow{\gamma}^{-}$ is empty and $P' = \alpha^{+}$. This way, $P = \exists \overrightarrow{\beta}^{-}$. $P' = \exists \overrightarrow{\beta}^{-}$. α^{+} , as required.

Case 2. $T \vdash \exists \overrightarrow{\alpha}^{-}. \alpha^{+} \geqslant P$

If the size of the inference tree is 1 then the only rule that can infer it is (VAR_+^{\geqslant}) , which implies that $\overrightarrow{\alpha}^{=}$ is empty and $P = \alpha^{+}$.

If the size of the inference tree is > 1 then the last rule inferring it must be $(\exists^{>})$. By inverting this rule, $P = \exists \overrightarrow{\beta}^{-}$. Q where $T, \overrightarrow{\beta}^{-} \vdash [\overrightarrow{N}/\overrightarrow{\alpha}^{-}]\alpha^{+} \geqslant Q$ and Q does not start with \exists . Notice that since α^{+} is positive, $[\overrightarrow{N}/\overrightarrow{\alpha}^{-}]\alpha^{+} = \alpha^{+}$, i.e. $T, \overrightarrow{\beta}^{-} \vdash \alpha^{+} \geqslant Q$.

By the induction hypothesis, $Q = \exists \overrightarrow{\beta}^{-\prime}$. α^{+} , and since Q does not start with \exists , $\overrightarrow{\beta}^{-\prime}$ is empty. This way, $P = \exists \overrightarrow{\beta}^{-}$. $Q = \exists \overrightarrow{\beta}^{-}$. α^{+} , as required.

Case 3. The negative cases $(T \vdash N \leqslant \forall \alpha^{+}, \alpha^{-} \text{ and } T \vdash \forall \alpha^{+}, \alpha^{-} \leqslant N)$ are proved analogously

Corollary 8 (Variables have no proper subtypes and supertypes). *Assuming that all mentioned types are well-formed in T*,

$$T \vdash P \geqslant \alpha^{+} \iff P = \exists \overrightarrow{\beta^{-}}. \alpha^{+} \iff T \vdash P \simeq^{\leqslant} \alpha^{+} \iff P \simeq^{D} \alpha^{+}$$

$$T \vdash \alpha^{+} \geqslant P \iff P = \exists \overrightarrow{\beta^{-}}. \alpha^{+} \iff T \vdash P \simeq^{\leqslant} \alpha^{+} \iff P \simeq^{D} \alpha^{+}$$

$$T \vdash N \leqslant \alpha^{-} \iff N = \forall \overrightarrow{\beta^{+}}. \alpha^{-} \iff T \vdash N \simeq^{\leqslant} \alpha^{-} \iff N \simeq^{D} \alpha^{-}$$

$$T \vdash \alpha^{-} \leqslant N \iff N = \forall \overrightarrow{\beta^{+}}. \alpha^{-} \iff T \vdash N \simeq^{\leqslant} \alpha^{-} \iff N \simeq^{D} \alpha^{-}$$

PROOF. Notice that $T \vdash \exists \overrightarrow{\beta}^-$. $\alpha^+ \simeq^{\leqslant} \alpha^+$ and $\exists \overrightarrow{\beta}^-$. $\alpha^+ \simeq^D \alpha^+$ and apply lemma 17.

Lemma 18 (Subtyping context irrelevance). Suppose that all the mentioned types are well-formed in T_1 and T_2 . Then

- + $T_1 \vdash P \geqslant Q$ is equivalent to $T_2 \vdash P \geqslant Q$;
- $-T_1 \vdash N \leq M$ is equivalent to $T_2 \vdash N \leq M$.

PROOF. We prove it by induction on the size of $T_1 \vdash P \geqslant Q$ and mutually, the size of $T_1 \vdash N \leqslant M$ All the cases except (\exists^{\geqslant}) and (\forall^{\leqslant}) are proven congruently: first, we apply the inversion to $T_1 \vdash P \geqslant Q$ to obtain the premises of the corresponding rule X, then we apply the induction hypothesis to each premise, and build the inference tree (with T_2) by the same rule X.

Suppose that the judgment is inferred by (\exists^{\geq}) . Then we are proving that $T_1 \vdash \exists \overrightarrow{\alpha}^{\geq}$. $P \geqslant \exists \overrightarrow{\beta}^{=}$. Q implies $T_2 \vdash \exists \overrightarrow{\alpha}^{\geq}$. $P \geqslant \exists \overrightarrow{\beta}^{=}$. Q (the other implication is proven symmetrically).

By inversion of $T_1 \vdash \exists \overrightarrow{\alpha} : P \geqslant \exists \overrightarrow{\beta} : Q$, we obtain σ such that $T_1, \overrightarrow{\beta} \vdash \sigma : \overrightarrow{\alpha}$ and $T_1, \overrightarrow{\beta} \vdash [\sigma]P \geqslant Q$. By lemma 15, $\mathbf{fv}([\sigma]P) \subseteq \mathbf{fv}(Q)$.

From the well-formedness statements $T_i \vdash \exists \overrightarrow{\alpha}^{-1}$. P and $T_i \vdash \exists \overrightarrow{\beta}^{-1}$. Q we have:

- $T_1, \overrightarrow{\alpha} \vdash P$, which also means $T_1, \overrightarrow{\beta} \vdash [\sigma]P$ by lemma 3;
- $T_2, \overrightarrow{\alpha} \vdash P$;
- $T_1, \overrightarrow{\beta}^- \vdash Q$; and
- $T_2, \overrightarrow{\beta^-} \vdash Q$, which means $\mathbf{fv}(Q) \subseteq T_2, \overrightarrow{\beta^-}$ by lemma 1, and combining it with $\mathbf{fv}([\sigma]P) \subseteq \mathbf{fv}(Q)$, we have $\mathbf{fv}([\sigma]P) \subseteq T_2, \overrightarrow{\beta^-}$.

Let us construct a substitution σ_0 in the following way:

$$\begin{cases} [\sigma_0]\alpha_i^- = [\sigma]\alpha_i^- & \text{for } \alpha_i^- \in \overrightarrow{\alpha} \cap \text{fv } (P) \\ [\sigma_0]\alpha_i^- = \forall \gamma^+. \uparrow \gamma^+ & \text{for } \alpha_i^- \in \overrightarrow{\alpha} \setminus \text{fv } (P) \\ [\sigma_0]\gamma^{\pm} = \gamma^{\pm} & \text{for any other } \gamma^{\pm} \end{cases}$$

2400 2401 (1) $[\sigma_0]P = [\sigma]P$. Since $\sigma_0|_{\mathbf{fv}(P)} = \sigma|_{\mathbf{fv}(P)}$ as functions (which follows from the construction of σ_0 and the signature of σ), $[\sigma_0]P = [\sigma_0|_{\text{fy}(P)}]P$ $[\sigma|_{\text{fy}(P)}]P = [\sigma]P$ (where the first and the last equalities are by lemma 4).

- (2) **fv** $([\sigma]P) \vdash \sigma_0 : \overrightarrow{\alpha}$. To show that, let us consider α_i
 - if $\alpha_i^- \in \overrightarrow{\alpha}^- \setminus \text{fv}(P)$ then $\cdot \vdash [\sigma_0]\alpha_i^-$, which can be weakened to $\text{fv}([\sigma]P) \vdash [\sigma_0]\alpha_i^-$;
 - if $\alpha_i^- \in \overrightarrow{\alpha}^- \cap \text{fv}(P)$, we have $[\sigma_0]\alpha_i^- = [\sigma]\alpha_i^-$, and thus, by specification of σ , T_1 , $\overrightarrow{\beta}^+$ $[\sigma_0]\alpha_i^-$. By corollary 1, it means $\mathbf{fv}([\sigma_0]\alpha_i^-) \vdash [\sigma_0]\alpha_i^-$, which we weaken (corollary 2) to $\mathbf{fv}([\sigma]P) \vdash [\sigma_0]\alpha_i^-$ (since $\mathbf{fv}([\sigma_0]\alpha_i^-) \subseteq \mathbf{fv}([\sigma_0]P)$ by lemma 14, and $[\sigma_0]P = [\sigma]P$

By corollary $1, T_1, \overrightarrow{\beta}^- \vdash [\sigma]^P$ implies $\mathbf{fv}([\sigma]^P) \vdash [\sigma]^P$, which, since $\mathbf{fv}([\sigma]^P) \subseteq T_2, \overrightarrow{\beta}^-$, is weakened to T_2 , $\overrightarrow{\beta}^- \vdash [\sigma] P$. and rewritten as T_2 , $\overrightarrow{\beta}^- \vdash [\sigma_0] P$.

Notice that the premises of the induction hold:

- (1) $T_i, \overrightarrow{\beta}^{-} \vdash [\sigma_0] P$,
 - (2) $T_i, \beta^- \vdash Q$, and
- (3) $T_1, \vec{\beta}^- \vdash [\sigma_0] P \geqslant Q$, notice that the tree inferring this judgment is the same tree inferring $T_1, \overrightarrow{\beta^-} \vdash [\sigma] P \geqslant Q$ (since $[\sigma_0] P = [\sigma] P$), i.e., it is a subtree of $T_1 \vdash \exists \overrightarrow{\alpha^-}. P \geqslant \exists \overrightarrow{\beta^-}. Q$.

This way, by the induction hypothesis, $T_2, \overrightarrow{\beta^-} \vdash [\sigma_0] P \geqslant Q$. Combining it with $T_2, \overrightarrow{\beta^-} \vdash \sigma_0 : \overrightarrow{\alpha^-}$ by (\exists^{\geqslant}) , we obtain $T_2 \vdash \exists \overrightarrow{\alpha}^{=}$. $P \geqslant \exists \overrightarrow{\beta}^{=}$. Q.

The case of $T_1 \vdash \forall \overrightarrow{\alpha^+}$. $N \leq \forall \overrightarrow{\beta^+}$. M is symmetric.

Lemma 19 (Weakening of subtyping context). Suppose T_1 and T_2 are contexts and $T_1 \subseteq T_2$. Then

- + $T_1 \vdash P \ge O$ implies $T_2 \vdash P \ge O$;
- $-T_1 \vdash N \leq M \text{ implies } T_2 \vdash N \leq M.$

PROOF. By straightforward induction on the subtyping derivation. The polymorphic cases follow from lemma 7.

Lemma 20 (Reflexivity of subtyping). Assuming all the types are well-formed in T,

- $-T \vdash N \leq N$
- $+ T \vdash P \geqslant P$

PROOF. Let us prove it by the size of N and mutually, P.

Case 1. $N = \alpha^-$

Then $T \vdash \alpha^- \leq \alpha^-$ is inferred immediately by (VAR^{\leq}_-) .

Case 2. $N = \forall \overrightarrow{\alpha}^{+}$. N' where $\overrightarrow{\alpha}^{+}$ is not empty

First, we rename $\overrightarrow{\alpha}^{+}$ to fresh $\overrightarrow{\beta}^{+}$ in $\forall \overrightarrow{\alpha}^{+}$. N' to avoid name clashes: $\forall \overrightarrow{\alpha}^{+}$. $N' = \forall \overrightarrow{\beta}^{+}$. $[\overrightarrow{\alpha}^{+}/\overrightarrow{\beta}^{+}]N'$ Then to infer $T \vdash \forall \overrightarrow{\alpha^+}$. $N' \leqslant \forall \overrightarrow{\beta^+}$. $[\overrightarrow{\alpha^+}/\overrightarrow{\beta^+}]N'$ we can apply (\forall^{\leqslant}) , instantiating $\overrightarrow{\alpha^+}$ with $\overrightarrow{\beta^+}$:

- fv $N \cap \overrightarrow{\beta^+} = \emptyset$ by choice of $\overrightarrow{\beta^+}$.
- $T, \overrightarrow{\beta^+} \vdash \overrightarrow{\beta^+}_i$, $T, \overrightarrow{\beta^+} \vdash [\overrightarrow{\beta^+}/\overrightarrow{\alpha^+}]N' \leq [\overrightarrow{\beta^+}/\overrightarrow{\alpha^+}]N'$ by the induction hypothesis, since the size of $[\overrightarrow{\beta}^+/\overrightarrow{\alpha}^+]N'$ is equal to the size of N', which is smaller than the size of $N = \forall \overrightarrow{\alpha}^+$. N'.

Case 3. $N = P \rightarrow M$

Then $T \vdash P \to M \leq P \to M$ is inferred by (\to^{\leq}) , since $T \vdash P \geq P$ and $T \vdash M \leq M$ hold the induction hypothesis.

Case 4. $N = \uparrow P$

Then $T + \uparrow P \leq \uparrow P$ is inferred by (\uparrow^{\leq}) , since $T + P \geq P$ holds by the induction hypothesis.

Case 5. The positive cases are symmetric to the negative ones.

Lemma 21 (Substitution preserves subtyipng). Suppose that all mentioned types are well-formed in T_1 , and σ is a substitution $T_2 \vdash \sigma : T_1$.

```
- If T_1 \vdash N \leq M then T_2 \vdash [\sigma]N \leq [\sigma]M.
```

+ If
$$T_1 \vdash P \geqslant Q$$
 then $T_2 \vdash [\sigma]P \geqslant [\sigma]Q$.

PROOF. We prove it by induction on the size of the derivation of $T_1 \vdash N \leq M$ and mutually, $T_1 \vdash P \geq Q$. Let us consider the last rule used in the derivation:

Case 1. (VAR $^{\leq}$). Then by inversion, $N = \alpha^-$ and $M = \alpha^-$. By reflexivity of subtyping (lemma 20), we have $T_2 \vdash [\sigma]\alpha^- \leq [\sigma]\alpha^-$, i.e. $T_2 \vdash [\sigma]N \leq [\sigma]M$, as required.

Case 2. (\forall^{\leq}) . Then by inversion, $N = \forall \overrightarrow{\alpha^+}$. N', $M = \forall \overrightarrow{\beta^+}$. M', where $\overrightarrow{\alpha^+}$ or $\overrightarrow{\beta^+}$ is not empty. Moreover, T_1 , $\overrightarrow{\beta^+} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leq M'$ for some T_1 , $\overrightarrow{\beta^+} \vdash \overrightarrow{P}$, and fv $N \cap \overrightarrow{\beta^+} = \emptyset$.

Notice that since the derivation of T_1 , $\overrightarrow{\beta^+} \vdash [\overrightarrow{P}/\alpha^+]N' \leq M'$ is a subderivation of the derivation of $T \vdash N \leq M$, its size is smaller, and hence, the induction hypothesis applies $(T_1, \overrightarrow{\beta^+} \vdash \sigma : T_1, \overrightarrow{\beta^+})$ by lemma 12): T_2 , $\overrightarrow{\beta^+} \vdash [\sigma][\overrightarrow{P}/\alpha^+]N' \leq [\sigma]M'$. Notice that by convention, $\overrightarrow{\alpha^+}$ and $\overrightarrow{\beta^+}$ are fresh, and thus, $[\sigma] \forall \overrightarrow{\alpha^+}$. $N' = \forall \overrightarrow{\alpha^+}$. $[\sigma]N'$ and

Notice that by convention, $\overrightarrow{\alpha^+}$ and $\overrightarrow{\beta^+}$ are fresh, and thus, $[\sigma] \forall \overrightarrow{\alpha^+}$. $N' = \forall \overrightarrow{\alpha^+}$. $[\sigma] N'$ and $[\sigma] \forall \overrightarrow{\beta^+}$. $M' = \forall \overrightarrow{\beta^+}$. $[\sigma] M'$, which means that the required $T_2, T \vdash [\sigma] \forall \overrightarrow{\alpha^+}$. $N' \leq [\sigma] \forall \overrightarrow{\beta^+}$. M' is rewritten as $T_2, T \vdash \forall \overrightarrow{\alpha^+}$. $[\sigma] N' \leq \forall \overrightarrow{\beta^+}$. $[\sigma] M'$.

To infer it, we apply (\forall^{\leq}) , instantiating α^+_i with $[\sigma]_i^P$:

- fv $[\sigma]N \cap \overrightarrow{\beta^+} = \emptyset$;
- $T_2, T, \overrightarrow{\beta^+} \vdash [\sigma] P_i$, by lemma 3 since from the inversion, $T_1, T, \overrightarrow{\beta^+} \vdash P_i$;
- $T, \overrightarrow{\beta^+} \vdash [[\sigma] \overrightarrow{P}/\overrightarrow{\alpha^+}][\sigma]N' \leqslant [\sigma]M'$ holds by lemma 11: Since $\overrightarrow{\alpha^+}$ is fresh, it is disjoint with the domain and the codomain of σ (T_1 and T_2), and thus, $[\sigma][\overrightarrow{P}/\overrightarrow{\alpha^+}]N' = [\sigma \ll \overrightarrow{P}/\overrightarrow{\alpha^+}][\sigma]N' = [[\sigma]\overrightarrow{P}/\overrightarrow{\alpha^+}][\sigma]N'$. Then $T_2, T, \overrightarrow{\beta^+} \vdash [\sigma][\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leqslant [\sigma]M'$ holds by the induction hypothesis.

Case 3. (\to^{\leqslant}) . Then by inversion, $N = P \to N_1$, $M = Q \to M_1$, $T \vdash P \geqslant Q$, and $T \vdash N_1 \leqslant M_1$ And by the induction hypothesis, $T' \vdash [\sigma]P \geqslant [\sigma]Q$ and $T' \vdash [\sigma]N_1 \leqslant [\sigma]M_1$. Then $T' \vdash [\sigma]N \leqslant [\sigma]M$, i.e. $T' \vdash [\sigma]P \to [\sigma]N_1 \leqslant [\sigma]Q \to [\sigma]M_1$, is inferred by (\to^{\leqslant}) .

Case 4. (\uparrow^{\leq}). Then by inversion, $N = \uparrow P$, $M = \uparrow Q$, and $T \vdash P \simeq^{\leq} Q$, which by inversion means that $T \vdash P \geqslant Q$ and $T \vdash Q \geqslant P$. Then the induction hypothesis applies, and we have $T' \vdash [\sigma]P \geqslant [\sigma]Q$ and $T' \vdash [\sigma]Q \geqslant [\sigma]P$. Then by sequential application of (\simeq^{\leq}) and (\uparrow^{\leq}) to these judgments, we have $T' \vdash \uparrow [\sigma]P \leqslant \uparrow [\sigma]Q$, i.e. $T' \vdash [\sigma]N \leqslant [\sigma]M$, as required.

Case 5. The positive cases are proved symmetrically.

Corollary 9 (Substitution preserves subtyping induced equivalence). *Suppose that* $T \vdash \sigma : T_1$. *Then*

```
+ if T_1 \vdash P, T_1 \vdash Q, and T_1 \vdash P \simeq^{\leq} Q then T \vdash [\sigma]P \simeq^{\leq} [\sigma]Q
```

```
- if T_1 \vdash N, T_1 \vdash M, and T_1 \vdash N \simeq^{\leq} M then T \vdash [\sigma]N \simeq^{\leq} [\sigma]M
```

Lemma 22 (Transitivity of subtyping). Assuming the types are well-formed in T,

```
- if T \vdash N_1 \leq N_2 and T \vdash N_2 \leq N_3 then T \vdash N_1 \leq N_3,
```

```
+ if T \vdash P_1 \geqslant P_2 and T \vdash P_2 \geqslant P_3 then T \vdash P_1 \geqslant P_3.
```

PROOF. To prove it, we formulate a stronger property, which will imply the required one, taking $\sigma = T + id : T$.

Assuming all the types are well-formed in *T*,

```
 - \text{ if } T \vdash N \leq M_1, T \vdash M_2 \leq K \text{, and for } T' \vdash \sigma : T, [\sigma]M_1 = [\sigma]M_2 \text{ then } T' \vdash [\sigma]N \leq [\sigma]K \\ + \text{ if } T \vdash P \geq Q_1, T \vdash Q_2 \geq R \text{, and for } T' \vdash \sigma : T, [\sigma]Q_1 = [\sigma]Q_2 \text{ then } T' \vdash [\sigma]P \geq [\sigma]R
```

We prove it by induction on $\operatorname{size}(T \vdash N \leq M_1) + \operatorname{size}(T \vdash M_2 \leq K)$ and mutually, on $\operatorname{size}(T \vdash P \geq Q_1) + \operatorname{size}(T \vdash Q_2 \geq R)$.

First, let us consider the 3 important cases.

Case 1. Let us consider the case when $M_1 = \forall \overrightarrow{\beta^+}_1$. α^- . Then by lemma 17, $T \vdash N \leqslant M_1$ means that $N = \forall \overrightarrow{\alpha^+}$. α^- . $[\sigma]M_1 = [\sigma]M_2$ means that $\forall \overrightarrow{\beta^+}_1$. $[\sigma]\alpha^- = [\sigma]M_2$. Applying σ to both sides of $T \vdash M_2 \leqslant K$ (by lemma 21), we obtain $T' \vdash [\sigma]M_2 \leqslant [\sigma]K$, that is $T' \vdash \forall \overrightarrow{\beta^+}_1$. $[\sigma]\alpha^- \leqslant [\sigma]K$. Since $\mathbf{fv}([\sigma]\alpha^-) \subseteq T$, α^- , it is disjoint from $\overrightarrow{\alpha^+}$ and $\overrightarrow{\beta^+}_1$, This way, by corollary 7, $T' \vdash \forall \overrightarrow{\beta^+}_1$. $[\sigma]\alpha^- \leqslant [\sigma]K$ is equivalent to $T' \vdash [\sigma]\alpha^- \leqslant [\sigma]K$, which is equivalent to $T' \vdash \forall \overrightarrow{\alpha^+}$. $[\sigma]\alpha^- \leqslant [\sigma]K$, that is $T' \vdash [\sigma]N \leqslant [\sigma]K$.

Case 2. Let us consider the case when $M_2 = \forall \beta^{+}_2$. α^{-} . This case is symmetric to the previous one. Notice that lemma 17 and corollary 7 are agnostic to the side on which the quantifiers occur, and thus, the proof stays the same.

Case 3. Let us decompose the types, by extracting the outer quantifiers:

- $N = \forall \alpha^+$. N', where $N' \neq \forall \ldots$,
- $M_1 = \forall \overrightarrow{\beta}^+_1$. M'_1 , where $M'_1 \neq \forall \ldots$,
- $M_2 = \forall \overrightarrow{\beta}^+_2$. M'_2 , where $M'_2 \neq \forall \dots$,
- $K = \forall \vec{\gamma}^{+}$. K', where $K' \neq \forall \dots$

and assume that at least one of $\overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}_1$, $\overrightarrow{\beta^+}_2$, and $\overrightarrow{\gamma^+}$ is not empty. Since $[\sigma]M_1 = [\sigma]M_2$, we have $\forall \overrightarrow{\beta^+}_1$. $[\sigma]M'_1 = \forall \overrightarrow{\beta^+}_2$. $[\sigma]M'_2$, and since M'_i are not variables (which was covered by the previous cases) and do not start with \forall , $[\sigma]M'_i$ do not start with \forall either, which means $\overrightarrow{\beta^+}_1 = \overrightarrow{\beta^+}_2$ and $[\sigma]M'_1 = [\sigma]M'_2$. Let us rename $\overrightarrow{\beta^+}_1$ and $\overrightarrow{\beta^+}_2$ to $\overrightarrow{\beta^+}$. Then $M_1 = \forall \overrightarrow{\beta^+}$. M'_1 and $M_2 = \forall \overrightarrow{\beta^+}$. M'_2 .

By lemma 16 applied twice to $T \vdash \forall \overrightarrow{\alpha^+}$. $N' \leq \forall \overrightarrow{\beta^+}$. M'_1 and to $T \vdash \forall \overrightarrow{\beta^+}$. $M'_2 \leq \forall \overrightarrow{\gamma^+}$. K', we have the following:

- (1) $T, \overrightarrow{\beta^+} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leq M'_1 \text{ for some } T, \overrightarrow{\beta^+} \vdash \overrightarrow{P};$
- (2) $T, \overrightarrow{\gamma^+} \vdash [\overrightarrow{Q}/\overrightarrow{\beta^+}]M_2' \leq K'$ for some $T, \overrightarrow{\gamma^+} \vdash \overrightarrow{Q}$.

And since at least one of $\overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}$, and $\overrightarrow{\gamma^+}$ is not empty, either $T \vdash N \leqslant M_1$ or $T \vdash M_2 \leqslant K$ is inferred by (\forall^{\leqslant}) , meaning that either T, $\overrightarrow{\beta^+} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leqslant M'_1$ is a proper subderivation of $T \vdash N \leqslant M_1$ or T, $\overrightarrow{\gamma^+} \vdash [\overrightarrow{Q}/\overrightarrow{\beta^+}]M'_2 \leqslant K'$ is a proper subderivation of $T \vdash M_2 \leqslant K$.

Notice that we can weaken and rearrange the contexts without changing the sizes of the derivations: $T, \overrightarrow{\beta^+}, \overrightarrow{\gamma^+} \vdash [\overrightarrow{D}/\overrightarrow{\alpha^+}]N' \leqslant M'_1$ and $T, \overrightarrow{\beta^+}, \overrightarrow{\gamma^+} \vdash [\overrightarrow{Q}/\overrightarrow{\beta^+}]M'_2 \leqslant K'$. This way, the sum of the sizes of these derivations is smaller than the sum of the sizes of $T \vdash N \leqslant M_1$ and $T \vdash M_2 \leqslant K$. Let us apply the induction hypothesis to these derivations, with the substitution $T', \overrightarrow{\gamma^+} \vdash \sigma \circ (\overrightarrow{Q}/\overrightarrow{\beta^+}) : T, \overrightarrow{\beta^+}, \overrightarrow{\gamma^+}$ (lemma 12). To apply the induction hypothesis.

Vol. 1, No. 1, Article Publication date: November 2023.

it is left to show that $\sigma \circ (\vec{Q}/\vec{\beta^{+}})$ unifies M'_{1} and $[\vec{Q}/\vec{\beta^{+}}]M'_{2}$:

$$[\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}]M'_{1} = [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^{+}}]M'_{1}$$

$$= [[\sigma]\overrightarrow{Q}/\overrightarrow{\beta^{+}}][\sigma]M'_{2} \qquad \text{by lemma 11}$$

$$= [[\sigma]\overrightarrow{Q}/\overrightarrow{\beta^{+}}][\sigma]M'_{2} \qquad \text{Since } [\sigma]M'_{1} = [\sigma]M'_{2}$$

$$= [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^{+}}]M'_{2} \qquad \text{by lemma 11}$$

$$= [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^{+}}][\overrightarrow{Q}/\overrightarrow{\beta^{+}}]M'_{2} \qquad \text{Since } T, \overrightarrow{\gamma^{+}} \vdash \overrightarrow{Q}, \text{ and } (T, \overrightarrow{\gamma^{+}}) \cap \overrightarrow{\beta^{+}} = \emptyset$$

$$= [\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}][\overrightarrow{Q}/\overrightarrow{\beta^{+}}]M'_{2}$$

This way the induction hypothesis gives us $T', \overrightarrow{\gamma^+} \vdash [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^+}][\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leq [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^+}]K'$, and since $T, \overrightarrow{\gamma^+} \vdash K'$, $[\overrightarrow{Q}/\overrightarrow{\beta^+}]K' = K'$, that is $T', \overrightarrow{\gamma^+} \vdash [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^+}][\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leq [\sigma]K'$. Let us rewrite the substitution that we apply to N':

$$[\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}} \circ \overrightarrow{P}/\overrightarrow{\alpha^{+}}]N' = [(\sigma \ll \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \circ \sigma \circ \overrightarrow{P}/\overrightarrow{\alpha^{+}}]N'$$
by lemma 11
$$= [(\sigma \ll \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \circ (\sigma \ll \overrightarrow{P}/\overrightarrow{\alpha^{+}}) \circ \sigma]N'$$
by lemma 11
$$= [(((\sigma \ll \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \circ \sigma) \ll \overrightarrow{P}/\overrightarrow{\alpha^{+}}) \circ \sigma]N'$$
Since fv $([\sigma]N') \cap \overrightarrow{\beta^{+}} = \emptyset$

$$= [((\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \ll \overrightarrow{P}/\overrightarrow{\alpha^{+}}) \circ \sigma]N'$$
by lemma 11
$$= [(\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \ll \overrightarrow{P}/\overrightarrow{\alpha^{+}}) [\sigma]N'$$

Notice that $(\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^+}) \ll \overrightarrow{P}/\overrightarrow{\alpha^+}$ is a substitution that turns α^+_i into $[\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^+}]P_i$, where $T', \overrightarrow{\gamma^+} \vdash [\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^+}]P_i$. This way, $T', \overrightarrow{\gamma^+} \vdash [(\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^+}) \ll \overrightarrow{P}/\overrightarrow{\alpha^+}][\sigma]N' \leqslant [\sigma]K'$ means $T \vdash \forall \overrightarrow{\alpha^+}$. $[\sigma]N' \leqslant \forall \overrightarrow{\gamma^+}$. $[\sigma]K'$ by lemma 16, that is $T \vdash [\sigma]N \leqslant [\sigma]K$, as required.

Now, we can assume that neither $T \vdash N \leq M_1$ nor $T \vdash M_2 \leq K$ is inferred by (\forall^{\leq}) , and that neither M_1 nor M_2 is equivalent to a variable. Because of that, $[\sigma]M_1 = [\sigma]M_2$ means that M_1 and M_2 have the same outer constructor. Let us consider the shape of M_1 .

Case 1. $M_1 = \alpha^-$ this case has been considered;

Case 2. $M_1 = \forall \vec{\beta}^{\perp}$. M'_1 this case has been considered;

Case 3. $M_1 = \uparrow Q_1$. Then as noted above, $[\sigma]M_1 = [\sigma]M_2$ means that $M_2 = \uparrow Q_2$ and $[\sigma]Q_1 = [\sigma]Q_2$. Moreover, $T \vdash N \leqslant \uparrow Q_1$ can only be inferred by (\uparrow^{\leqslant}) , and thus, $N = \uparrow P$, and by inversion, $T \vdash P \geqslant Q_1$ and $T \vdash Q_1 \geqslant P$. Analogously, $T \vdash \uparrow Q_2 \leqslant K$ means that $K = \uparrow R$, $T \vdash Q_2 \geqslant R$, and $T \vdash R \geqslant Q_2$.

Notice that the derivations of $T \vdash P \geqslant Q_1$ and $T \vdash Q_1 \geqslant P$ are proper sub-derivations of $T \vdash N \leqslant M_1$, and the derivations of $T \vdash Q_2 \geqslant R$ and $T \vdash R \geqslant Q_2$ are proper sub-derivations of $T \vdash M_2 \leqslant K$. This way, the induction hypothesis is applicable:

- applying the induction hypothesis to $T \vdash P \ge Q_1$ and $T \vdash Q_2 \ge R$ with $T' \vdash \sigma : T$ unifying Q_1 and Q_2 , we obtain $T' \vdash [\sigma]P \ge [\sigma]R$;
- applying the induction hypothesis to $T \vdash R \ge Q_2$ and $T \vdash Q_1 \ge P$ with $T' \vdash \sigma : T$ unifying Q_2 and Q_1 , we obtain $T' \vdash [\sigma]R \ge [\sigma]P$.

This way, by (\uparrow^{\leq}) , $T' \vdash [\sigma]N \leq [\sigma]K$, as required.

Case 4. $M_1 = Q_1 \rightarrow M_1'$. Then as noted above, $[\sigma]M_1 = [\sigma]M_2$ means that $M_2 = Q_2 \rightarrow M_2'$. $[\sigma]Q_1 = [\sigma]Q_2$, and $[\sigma]M_1' = [\sigma]M_2'$. Moreover, $T \vdash N \leqslant Q_1 \rightarrow M_1'$ can only be inferred by $(\rightarrow^{\leqslant})$, and thus, $N = P \rightarrow N'$, and by inversion, $T \vdash P \geqslant Q_1$ and $T \vdash N' \leqslant M_1'$. Analogously, $T \vdash Q_2 \rightarrow M_2' \leqslant K$ means that $K = R \rightarrow K'$, $T \vdash Q_2 \geqslant R$, and $T \vdash M_2' \leqslant K'$.

Notice that the derivations of $T \vdash P \geqslant Q_1$ and $T \vdash N' \leqslant M'_1$ are proper sub-derivations of $T \vdash P \rightarrow N' \leqslant Q_1 \rightarrow M'_1$, and the derivations of $T \vdash Q_2 \geqslant R$ and $T \vdash M'_2 \leqslant K'$ are proper sub-derivations of $T \vdash Q_2 \rightarrow M'_2 \leqslant R \rightarrow K'$. This way, the induction hypothesis is applicable:

- applying the induction hypothesis to $T \vdash P \geqslant Q_1$ and $T \vdash Q_2 \geqslant R$ with $T' \vdash \sigma : T$ unifying Q_1 and Q_2 , we obtain $T' \vdash [\sigma]P \geqslant [\sigma]R$;
- applying the induction hypothesis to $T \vdash N' \leq M_1'$ and $T \vdash M_2' \leq K'$ with $T' \vdash \sigma : T$ unifying M_1' and M_2' , we obtain $T' \vdash [\sigma]N' \leq [\sigma]K'$.

This way, by (\to^{\leq}) , $T' \vdash [\sigma]P \to [\sigma]N' \leq [\sigma]R \to [\sigma]K'$, that is $T' \vdash [\sigma]N \leq [\sigma]K$, as required.

After that, we consider all the analogous positive cases and prove them symmetrically.

Corollary 10 (Transitivity of equivalence). Assuming the types are well-formed in T,

```
- if T \vdash N_1 \simeq^{\leqslant} N_2 and T \vdash N_2 \simeq^{\leqslant} N_3 then T \vdash N_1 \simeq^{\leqslant} N_3,
```

```
+ if T \vdash P_1 \simeq^{\leqslant} P_2 and T \vdash P_2 \simeq^{\leqslant} P_3 then T \vdash P_1 \simeq^{\leqslant} P_3.
```

2596 2597 **Lemma 23** (Declarative Equivalence is invariant under bijections). *Suppose* μ *is a bijection* μ *vars*₁ \leftrightarrow *vars*₂, *then*

- + $P_1 \simeq^D P_2$ implies $[\mu]P_1 \simeq^D [\mu]P_2$, and there exists an inference tree of $[\mu]P_1 \simeq^D [\mu]P_2$ with the same shape as the one inferring $P_1 \simeq^D P_2$;
- $N_1 \simeq^D N_2$ implies $[\mu]N_1 \simeq^D [\mu]N_2$, and there exists an inference tree of $[\mu]N_1 \simeq^D [\mu]N_2$ with the same shape as the one inferring $N_1 \simeq^D N_2$.

PROOF. We prove it by induction on $P_1 \simeq^D P_2$ and mutually, on $N_1 \simeq^D N_2$. Let us consider the last rule used in the derivation.

```
Case 1. (\forall^{\simeq^D})
```

Then we decompose N_1 as $\forall \overrightarrow{\alpha^+}_1$. M_1 and N_2 as $\forall \overrightarrow{\alpha^+}_2$. M_2 , where M_1 and M_2 do not start with \forall -quantifiers. where $|\overrightarrow{\alpha^+}_1| + |\overrightarrow{\alpha^+}_2| > 0$. By convention, let us assume that $\overrightarrow{\alpha^+}_1$ and $\overrightarrow{\alpha^+}_2$ are disjoint form $vars_2$ and $vars_1$.

By inversion, $\overrightarrow{\alpha^+}_1 \cap \mathbf{fv} M_2 = \emptyset$ and $M_1 \simeq^D [\mu'] M_2$ for some bijection $\mu' : (\overrightarrow{\alpha^+}_2 \cap \mathbf{fv} M_2) \leftrightarrow (\overrightarrow{\alpha^+}_1 \cap \mathbf{fv} M_1)$. Then let us apply the induction hypothesis to $M_1 \simeq^D [\mu'] M_2$ to obtain $[\mu] M_1 \simeq^D [\mu] [\mu'] M_2$ inferred by the tree of the same shape as $M_1 \simeq^D [\mu'] M_2$.

Notice that $[\mu]M_1$ and $[\mu]M_2$ do not start with \forall , That is $[\mu]\forall \overrightarrow{\alpha^+}_1$. $M_1 \simeq^D [\mu]\forall \overrightarrow{\alpha^+}_2$. M_2 rewritten as $\forall \overrightarrow{\alpha^+}_1$. $[\mu]M_1 \simeq^D \forall \overrightarrow{\alpha^+}_2$. $[\mu]M_2$, can be inferred by (\forall^{\simeq^D}) :

- (1) α^{\downarrow}_1 is disjoint from $vars_2 \cup \mathbf{fv} M_2 \subseteq \mathbf{fv} [\mu] M_2$;
- (2) $[\mu]M_1 \simeq^D [\mu'][\mu]M_2$ because $[\mu'][\mu]M_2 = [\mu][\mu']M_2$ (by corollary 4: $\mu' : (\overrightarrow{\alpha^{\dagger}}_2 \cap \mathbf{fv} M_2) \leftrightarrow (\overrightarrow{\alpha^{\dagger}}_1 \cap \mathbf{fv} M_1), \mu : vars_1 \leftrightarrow vars_2, vars_1$ is disjoint from $\overrightarrow{\alpha^{\dagger}}_2$ and $\overrightarrow{\alpha^{\dagger}}_1; \overrightarrow{\alpha^{\dagger}}_2$ is disjoint from $vars_1$ and $vars_2$)

Notice that it is the same rule as the one inferring $N_1 \simeq^D N_2$, and thus, the shapes of the trees are the same.

Case 2. $(VAR_{-}^{\simeq D})$

Then $N_1 = N_2 = \alpha^-$, and the required $[\mu]\alpha^- = [\mu]\alpha^-$ is also inferred by $(VAR_-^{\simeq D})$, since $[\mu]\alpha^-$ is a variable.

Case 3. (\rightarrow^{\simeq^D})

Then we are proving that $P_1 \to M_1 \simeq^D P_2 \to M_2$ implies $[\mu](P_1 \to M_1) \simeq^D [\mu](P_2 \to M_2)$ (preserving the tree structure).

By inversion, we have $P_1 \simeq^D P_2$ and $M_1 \simeq^D M_2$, and thus, by the induction hypothesis, $[\mu]P_1 \simeq^D [\mu]P_2$ and $[\mu]M_1 \simeq^D [\mu]M_2$. Then $[\mu](P_1 \to M_1) \simeq^D [\mu](P_2 \to M_2)$, or in other words, $[\mu]P_1 \to [\mu]M_1 \simeq^D [\mu]P_2 \to [\mu]M_2$, is inferred by the same rule— (\to^{\simeq^D}) .

Case 4. (\uparrow^{\simeq^D}) This case is done by similar congruent arguments as the previous one.

Case 5. The positive cases are proved symmetrically.

Lemma 24. The set of free variables is invariant under equivalence.

```
- If N \simeq^D M then fy N = \text{fy } M (as sets)
```

+ If $P \simeq^D Q$ then fv P = fv Q (as sets)

PROOF. Mutual induction on $N \simeq^D M$ and $P \simeq^D Q$ The base cases (($VAR_-^{\Sigma^D}$) and ($VAR_+^{\Sigma^D}$)) are trivial. So are (\uparrow^{Σ^D}), (\downarrow^{Σ^D}), and (\to^{Σ^D}), where the required property follows from the induction hypothesis.

Let us consider the case when the equivalence is formed by (\forall^{\simeq^D}) , that is the equivalence has a shape $\forall \overrightarrow{\alpha^+}$. $N \simeq^D \forall \overrightarrow{\beta^+}$. M, and by inversion, there is a bijection $\mu : (\overrightarrow{\beta^+} \cap \mathbf{fv} M) \leftrightarrow (\overrightarrow{\alpha^+} \cap \mathbf{fv} N)$ such that $N \simeq^D [\mu]M$, which by the induction hypothesis means $\mathbf{fv} N = \mathbf{fv} [\mu]M = [\mu]\mathbf{fv} M$.

Let us ensure by alpha-equivalence that $\overrightarrow{\alpha^+}$ is disjoint from $\mathbf{fv} M$. Then $(\mathbf{fv} \vee \overrightarrow{\beta^+}, M) \setminus \overrightarrow{\alpha^+} = \mathbf{fv} \vee \overrightarrow{\beta^+}, M$. Then we apply the following chain of equalities: $\mathbf{fv} \vee \overrightarrow{\alpha^+}, N = \mathbf{fv} N \setminus \overrightarrow{\alpha^+} = ([\mu] \mathbf{fv} M) \setminus \overrightarrow{\alpha^+} = [\mu] (\mathbf{fv} \vee \overrightarrow{\beta^+}, M \cup (\overrightarrow{\beta^+} \cap \mathbf{fv} M)) \setminus \overrightarrow{\alpha^+} = ([\mu] \mathbf{fv} \vee \overrightarrow{\beta^+}, M) \cup ([\mu] \mathbf{fv} \vee \overrightarrow{\beta^+}, M)$

Symmetrically, we prove the case when the equivalence is formed by (\exists^{\cong^D}) .

Lemma 25 (Declarative equivalence is transitive).

```
+ if P_1 \simeq^D P_2 and P_2 \simeq^D P_3 then P_1 \simeq^D P_3,
```

- if $N_1 \simeq^D N_2$ and $N_2 \simeq^D N_3$ then $N_1 \simeq^D N_3$.

PROOF. We prove it by $\text{size}(P_1 \simeq^D P_2) + \text{size}(P_2 \simeq^D P_3)$ and mutually, $\text{size}(N_1 \simeq^D N_2) + \text{size}(N_2 \simeq^D N_3)$, where by size, we mean the size of the nodes in the corresponding inference tree

Case 1. First, let us consider the case when either $N_1 \simeq^D N_2$ or $N_2 \simeq^D N_3$ is inferred by (\forall^{\simeq^D}) . Let us decompose N_1 , N_2 , and N_3 as follows: $N_1 = \forall \overrightarrow{\alpha^+}_1$. M_1 , $N_2 = \forall \overrightarrow{\alpha^+}_2$. M_2 , and $N_3 = \forall \overrightarrow{\alpha^+}_3$. M_3 .

Then by inversion of $\forall \alpha^+_1$. $M_1 \simeq^D \forall \alpha^+_2$. M_2 (or if α^+_1 and α^+_2 are both empty, by assumption):

- (1) $\overrightarrow{\alpha}^+_1 \cap \text{fv } M_2 = \emptyset \text{ and }$
- (2) there exists a bijection on variables $\mu_1: (\overrightarrow{\alpha}^+_2 \cap \mathbf{fv} M_2) \leftrightarrow (\overrightarrow{\alpha}^+_1 \cap \mathbf{fv} M_1)$ such that $M_1 \simeq^D [\mu_1] M_2$.

Analogously, $\forall \overrightarrow{\alpha}_1^+$. $M_1 \simeq^D \forall \overrightarrow{\alpha}_2^+$. M_2 implies:

- (1) $\overrightarrow{\alpha}^+_2 \cap \mathbf{fv} M_3 = \emptyset$ and
- (2) $M_2 \simeq^D [\mu_2] M_3$ for some bijection $\mu_2 : (\overrightarrow{\alpha^+}_3 \cap \text{fv } M_3) \leftrightarrow (\overrightarrow{\alpha^+}_2 \cap \text{fv } M_2)$.

Notice that either $M_1 \simeq^D [\mu_1] M_2$ is inferred by a proper sub-tree of $\forall \overrightarrow{\alpha^+}_1$. $M_1 \simeq^D \forall \overrightarrow{\alpha^+}_2$. M_2 or $M_2 \simeq^D [\mu_2] M_3$ is inferred by a proper sub-tree of $\forall \overrightarrow{\alpha^+}_2$. $M_2 \simeq^D \forall \overrightarrow{\alpha^+}_3$. M_3 .

Then by lemma 23, $[\mu_1]M_2 \simeq^D [\mu_1 \circ \mu_2]M_3$ and moreover, size($[\mu_1]M_2 \simeq^D [\mu_1 \circ \mu_2]M_3$) = size($M_2 \simeq^D [\mu_2]M_3$).

Since at least one of the trees inferring $M_1 \simeq^D [\mu_1] M_2$ and $M_2 \simeq^D [\mu_2] M_3$ is a proper sub-tree of the corresponding original tree, $\text{size}(M_1 \simeq^D [\mu_1] M_2) + \text{size}(M_2 \simeq^D [\mu_2] M_3) < 0$

```
\operatorname{size}(\forall \alpha^{+}_{1}, M_{1} \simeq^{D} \forall \alpha^{+}_{2}, M_{2}) + \operatorname{size}(\forall \alpha^{+}_{2}, M_{2} \simeq^{D} \forall \alpha^{+}_{3}, M_{3}), \text{ i.e., the induction hypothesis}
2647
                     is applicable.
2648
                     By the induction hypothesis, M_1 \simeq^D [\mu_1 \circ \mu_2] M_3. Where \mu_1 \circ \mu_2 is a bijection on variables
2649
                     \mu_1 \circ \mu_2 : (\overrightarrow{\alpha^+}_3 \cap \text{fv } M_3) \leftrightarrow (\overrightarrow{\alpha^+}_1 \cap \text{fv } M_1). Then \forall \overrightarrow{\alpha^+}_1 : M_1 \simeq^D \forall \overrightarrow{\alpha^+}_3 : M_3 \text{ by } (\forall^{\cong^D}).
2650
                     Once this case has been considered, we can assume that neither N_1 \simeq^D N_2 nor N_2 \simeq^D N_3
2651
                     is inferred by (\forall^{\simeq^D}).
2652
2653
                 Case 2. N_1 \simeq^D N_2 is inferred by (VAR_-^{\simeq D})
2654
                     Then N_1 = N_2 = \alpha^-, and thus, N_1 \simeq^D N_3 holds since N_2 \simeq^D N_3.
                 Case 3. N_1 \simeq^D N_2 is inferred by (\rightarrow^{\simeq^D})
2655
                     Then N_1 = P_1 \rightarrow M_1 and N_2 = P_2 \rightarrow M_2, and by inversion, P_1 \simeq^D P_2 and M_1 \simeq^D M_2.
2656
                     Moreover, since N_3 does not start with \forall, N_2 \simeq^D N_3 is also inferred by (\rightarrow^{\simeq^D}), which means
2658
                     that N_3 = P_3 \rightarrow M_3, P_2 \simeq^D P_3, and M_2 \simeq^D M_3.
                    Then by the induction hypothesis, P_1 \simeq^D P_3 and M_1 \simeq^D M_3, and thus, P_1 \to M_1 \simeq^D P_3 \to M_1 \simeq^D P_3 \to M_2
2660
                      M_3 by (\rightarrow^{\simeq^D}).
                 Case 4. N_1 \simeq^D N_2 is inferred by (\rightarrow^{\simeq D})
2662
                     For this case, the reasoning is the same as for the previous one.
                 Case 5. The positive cases are proved symmetrically.
2664
                                                                                                                                                            2667
         Lemma 26 (Type well-formedness is invariant under equivalence). Mutual subtyping implies
         declarative equivalence.
                 + if P \simeq^D O then T \vdash P \iff T \vdash O,
                 -if N \simeq^D M \text{ then } T \vdash N \iff T \vdash M
2671
2672
             PROOF. We prove it by induction on P \simeq^D Q and mutually, on N \simeq^D M. Let us consider the last
2673
         rule used in the derivation.
2674
                 Case 1. (VAR_-^{\infty}), that is N \simeq^D M has shape \alpha^- \simeq^D \alpha^-.
                     Than T \vdash P \iff T \vdash Q is rewritten as T \vdash \alpha^- \iff T \vdash \alpha^-, which holds trivially.
2676
                 Case 2. (\uparrow^{\simeq^D}), that is N \simeq^D M has shape \uparrow P \simeq^D \uparrow Q.
                     By inversion, P \simeq^D Q, and by the induction hypothesis, T \vdash P \iff T \vdash Q. Also notice
                     that T \vdash \uparrow P \iff T \vdash P and T \vdash \uparrow Q \iff T \vdash Q by inversion and (\uparrow^{WF}). This way
                     T \vdash \uparrow P \iff T \vdash P \iff T \vdash Q \iff T \vdash \uparrow Q.
                 Case 3. (\rightarrow^{\simeq^D}), that is N \simeq^D M has shape P \to N' \simeq^D Q \to M'.
                     Then by inversion, P \simeq^D Q and N' \simeq^{\overline{D}} M', and by the induction hypothesis, T \vdash P \iff
2682
2683
                     T \vdash O and T \vdash N' \iff T \vdash M'.
                                                                                by inversion and (\rightarrow^{WF})
2684
                     T \vdash P \rightarrow N' \iff T \vdash P \text{ and } T \vdash N'
2685
                                          \iff T \vdash O and T \vdash M' as noted above
2686
                                         \iff T \vdash O \rightarrow M'
                                                                                by (\rightarrow^{WF}) and inversion
2687
                 Case 4. (\forall^{\simeq D}), that is N \simeq^D M has shape \forall \overrightarrow{\alpha^+}. N' \simeq^D \forall \overrightarrow{\beta^+}. M'.
2688
                     By inversion, \forall \overrightarrow{\alpha^+}. N' \simeq^D \forall \overrightarrow{\beta^+}. M' means that \overrightarrow{\alpha^+} \cap \mathbf{fv} M = \emptyset and that there exists a bijection
2690
                     on variables \mu: (\overrightarrow{\beta^+} \cap \mathbf{fv} M') \leftrightarrow (\overrightarrow{\alpha^+} \cap \mathbf{fv} N') such that N' \simeq^D [\mu] M'.
2691
```

By inversion and (\forall^{WF}) , $T \vdash \forall \overrightarrow{\alpha^+}$. N' is equivalent to $T, \overrightarrow{\alpha^+} \vdash N'$, and by lemma 2, it is

equivalent to T, $(\alpha^+ \cap \mathbf{fv} N') \vdash N'$, which, by the induction hypothesis, is equivalent to

2692

2693

2694 2695 $T, (\alpha^{+} \cap \mathbf{fv} N') \vdash [\mu]M'.$

Vol. 1, No. 1, Article Publication date: November 2023.

Anon.
                                                    Analogously, T \vdash \forall \overrightarrow{\beta^+}. M' is equivalent to T, (\overrightarrow{\beta^+} \cap \mathbf{fv} M') \vdash M'. By lemma 3, it implies
                                                    T, (\overrightarrow{\alpha^+} \cap \mathbf{fv} M') \vdash [\mu]M'. And vice versa, T, (\overrightarrow{\alpha^+} \cap \mathbf{fv} M') \vdash [\mu]M' implies T, (\overrightarrow{\beta^+} \cap \mathbf{fv} M') \vdash [\mu]M'
2697
2698
                                                     [\mu^{-1}][\mu]M'.
                                                   This way, both T \vdash \forall \overrightarrow{\alpha^+}. N' and T \vdash \forall \overrightarrow{\beta^+}. M' are equivalent to T, (\overrightarrow{\alpha^+} \cap \mathbf{fv} \, N') \vdash [\mu]M'.
2699
2700
                                           Case 5. For the cases of the positive types, the proofs are symmetric.
2701
2702
2703
                        Lemma 27 (Soundness of equivalence). Declarative equivalence implies mutual subtyping.
2704
                                          + if T \vdash P, T \vdash Q, and P \simeq^D Q then T \vdash P \simeq^{\leq} Q,
2705
                                          - if T \vdash N, T \vdash M, and N \simeq^D M then T \vdash N \simeq^{\leq} M.
2706
                                 PROOF. We prove it by mutual induction on P \simeq^D Q and N \simeq^D M.
2707
                                           Case 1. \alpha^- \simeq^D \alpha^-
2708
                                                    Then T \vdash \alpha^- \leq \alpha^- by (VAR^{\leq}), which immediately implies T \vdash \alpha^- \simeq^{\leq} \alpha^- by (\simeq^{\leq}).
                                           Case 2. \uparrow P \simeq^D \uparrow Q
2710
                                                    Then by inversion of (\uparrow^{\leq}), P \simeq^{D} Q, and from the induction hypothesis, T \vdash P \simeq^{\leq} Q, and (by
2711
                                                     symmetry) T \vdash Q \simeq^{\leq} P.
2712
                                                    When (\uparrow^{\leq}) is applied to T \vdash P \simeq^{\leq} Q, it gives us T \vdash \uparrow P \leq \uparrow Q; when it is applied to T \vdash Q \simeq^{\leq} P
                                                    we obtain T \vdash \uparrow Q \leqslant \uparrow P. Together, it implies T \vdash \uparrow P \simeq^{\leqslant} \uparrow Q.
2714
                                           Case 3. P \rightarrow N \simeq^D O \rightarrow M
2715
                                                    Then by inversion of (\rightarrow^{\leq}), P \simeq^D Q and N \simeq^D M. By the induction hypothesis, T \vdash P \simeq^{\leq} Q
2716
                                                     and T \vdash N \simeq^{<} M, which means by inversion: (i) T \vdash P \geq O, (ii) T \vdash O \geq P, (iii) T \vdash N \leq M.
2717
                                                    (iv) T \vdash M \leq N. Applying (\rightarrow^{\leq}) to (i) and (iii), we obtain T \vdash P \to N \leq Q \to M; applying it
2718
                                                     to (ii) and (iv), we have T \vdash Q \to M \leq P \to N. Together, it implies T \vdash P \to N \simeq^{\leq} Q \to M
2719
                                           Case 4. \forall \overrightarrow{\alpha^+}. N \simeq^D \forall \overrightarrow{\beta^+}. M
2720
                                                    Then by inversion, there exists bijection \mu: (\overrightarrow{\beta^+} \cap \mathbf{fv} M) \leftrightarrow (\overrightarrow{\alpha^+} \cap \mathbf{fv} N), such that N \simeq^D [\mu] M
2721
2722
                                                    By the induction hypothesis, T, \overrightarrow{\alpha^+} \vdash N \simeq^{\leq} [\mu]M. From corollary 9 and the fact that \mu is
2723
                                                    bijective, we also have T, \overrightarrow{\beta^+} \vdash [\mu^{-1}]N \simeq^{\leq} M.
2724
                                                   Let us construct a substitution \overrightarrow{\alpha^+} \vdash \overrightarrow{P}/\overrightarrow{\beta^+} : \overrightarrow{\beta^+} by extending \mu with arbitrary positive types
2725
                                                    on \overrightarrow{\beta^+} \setminus \mathbf{fv} M.
2726
                                                    Notice that [\mu]M = [\overrightarrow{P}/\overrightarrow{\beta^+}]M, and therefore, T, \overrightarrow{\alpha^+} \vdash N \simeq^{\leq} [\mu]M implies T, \overrightarrow{\alpha^+} \vdash [\overrightarrow{P}/\overrightarrow{\beta^+}]M \leq
2727
                                                       N. Then by (\forall^{\leq}), T \vdash \forall \overrightarrow{\beta^+}. M \leq \forall \overrightarrow{\alpha^+}. N.
2728
                                                    Analogously, we construct the substitution from \mu^{-1}, and use it to instantiate \overrightarrow{\alpha}^+ in the
2729
                                                    application of (\forall^{\leq}) to infer T \vdash \forall \overrightarrow{\alpha^+}. N \leq \forall \overrightarrow{\beta^+}. M.
2730
                                                    This way, T \vdash \forall \overrightarrow{\beta^{+}}. M \leqslant \forall \overrightarrow{\alpha^{+}}. N and T \vdash \forall \overrightarrow{\alpha^{+}}. N \leqslant \forall \overrightarrow{\beta^{+}}. M gives us T \vdash \forall \overrightarrow{\beta^{+}}. M \simeq^{\leqslant} \forall \overrightarrow{\alpha^{+}}. N \Leftrightarrow \forall \overrightarrow{\beta^{+}}. M \Leftrightarrow \forall \overrightarrow{\beta^{
2731
2732
                                           Case 5. For the cases of the positive types, the proofs are symmetric.
2733
2734
                        Lemma 28 (Subtyping induced by disjoint substitutions). Suppose that T \vdash \sigma_1 : T_1 and T \vdash \sigma_2 : T_1
2735
                        where T_i \subseteq T and T_1 \cap T_2 = \emptyset. Then
2736
2737
                                          - assuming T \vdash N, T \vdash [\sigma_1]N \leq [\sigma_2]N implies T \vdash \sigma_i \simeq^{\leq} id : \mathbf{fv} N

2793

a. $\alpha^- \notin T_1$ and $\alpha^- \notin T_2$

Then $T \vdash \sigma_i \simeq^{\leqslant} id : \alpha^-$ holds immediately, since $[\sigma_i]\alpha^- = [id]\alpha^- = \alpha^-$ and $T \vdash \alpha^- \simeq^{\leqslant}$ α^{-} .

b. $\alpha^- \in T_1$ and $\alpha^- \in T_2$

This case is not possible by assumption: $T_1 \cap T_2 = \emptyset$.

 $c. \ \alpha^- \in T_1 \text{ and } \alpha^- \notin T_2$

Then we have $T \vdash [\sigma_1]\alpha^- \leq \alpha^-$, which by corollary 8 means $T \vdash [\sigma_1]\alpha^- \simeq^{\leq} \alpha^-$, and hence, $T \vdash \sigma_1 \simeq^{\leq} id : \alpha^-$.

 $T \vdash \sigma_2 \simeq^{\leq} id : \alpha^- \text{ holds since } [\sigma_2] \alpha^- = \alpha^-, \text{ similarly to case } 1.a.$

d. $\alpha^- \notin T_1$ and $\alpha^- \in T_2$

Then we have $T \vdash \alpha^- \leq [\sigma_2]\alpha^-$, which by corollary 8 means $T \vdash \alpha^- \simeq^{\leq} [\sigma_2]\alpha^-$, and hence, $T \vdash \sigma_2 \simeq^{\leq} id : \alpha^-$.

 $T \vdash \sigma_1 \simeq^{\leq} id : \alpha^- \text{ holds since } [\sigma_1] \alpha^- = \alpha^-, \text{ similarly to case } 1.a.$

Case 2. $N = \forall \alpha^{+}$. M

Then by inversion, $T, \overrightarrow{\alpha^+} \vdash M$. $T \vdash [\sigma_1]N \leqslant [\sigma_2]N$ is rewritten as $T \vdash [\sigma_1] \forall \overrightarrow{\alpha^+}$. $M \leqslant [\sigma_2]N$ $[\sigma_2] \forall \overrightarrow{\alpha^+}$. M. By the congruence of substitution and by the inversion of (\forall^{\leq}) , $T, \overrightarrow{\alpha^+}$ $[\overrightarrow{Q}/\overrightarrow{\alpha^+}][\sigma_1]M \leq [\sigma_2]M$, where $T, \overrightarrow{\alpha^+} \vdash Q_i$. Let us denote the (Kleisli) composition of σ_1 and $\overrightarrow{Q}/\overrightarrow{\alpha^+}$ as σ_1' , noting that $T, \overrightarrow{\alpha^+} \vdash \sigma_1' : T_1, \overrightarrow{\alpha^+}$, and $(T_1, \overrightarrow{\alpha^+}) \cap T_2 = \emptyset$.

Let us apply the induction hypothesis to M and the substitutions σ'_1 and σ_2 with T, $\overrightarrow{\alpha^+}$ \vdash $[\sigma_1']M \leq [\sigma_2]M$ to obtain:

$$T, \overrightarrow{\alpha^+} \vdash \sigma_1' \simeq^{\leqslant} id : \mathbf{fv} M$$
 (1)

$$T, \overrightarrow{\alpha^+} \vdash \sigma_2 \simeq^{\leqslant} id : fv M$$
 (2)

Then $T \vdash \sigma_2 \simeq^{\leq} id : \mathbf{fv} \forall \overrightarrow{\alpha^+}$. M holds by strengthening of 2: for any $\beta^{\pm} \in \mathbf{fv} \forall \overrightarrow{\alpha^+}$. M =fv $M \setminus \overrightarrow{\alpha^{+}}, T, \overrightarrow{\alpha^{+}} \vdash [\sigma_{2}]\beta^{\pm} \simeq \beta^{\pm}$ is strengthened to $T \vdash [\sigma_{2}]\beta^{\pm} \simeq \beta^{\pm}$, because fv $[\sigma_{2}]\beta^{\pm} = \beta^{\pm}$ fv $\beta^{\pm} = \{\beta^{\pm}\} \subseteq T$.

To show that $T \vdash \sigma_1 \simeq^{\leq} id : \mathbf{fv} \forall \alpha^{\perp}$. M, let us take an arbitrary $\beta^{\pm} \in \mathbf{fv} \forall \alpha^{\perp}$. $M = \mathbf{fv} M \setminus \alpha^{\perp}$ $\beta^{\pm} = [id]\beta^{\pm}$ by definition of id

$$\simeq^{\leq} [\sigma_1'] \beta^{\pm}$$
 by 1

=
$$[\overrightarrow{Q}/\overrightarrow{\alpha^+}][\sigma_1]\beta^{\pm}$$
 by definition of σ'_1

$$= [\sigma_1] \beta^{\pm} \qquad \text{because } \overrightarrow{\alpha^{+}} \cap \mathbf{fv} [\sigma_1] \beta^{\pm} \subseteq \overrightarrow{\alpha^{+}} \cap T = \emptyset$$

This way, $T \vdash [\sigma_1] \beta^{\pm} \simeq^{\leqslant} \beta^{\pm}$ for any $\beta^{\pm} \in \text{fv } \forall \overrightarrow{\alpha^+}$. M and thus, $T \vdash \sigma_1 \simeq^{\leqslant} \text{id} : \text{fv } \forall \overrightarrow{\alpha^+}$. M.

Case 3. $N = P \rightarrow M$

Then by inversion, $T \vdash P$ and $T \vdash M$. $T \vdash [\sigma_1]N \leq [\sigma_2]N$ is rewritten as $T \vdash [\sigma_1](P \to M) \leq$ $[\sigma_2](P \to M)$, then by congruence of substitution, $T \vdash [\sigma_1]P \to [\sigma_1]M \leq [\sigma_2]P \to [\sigma_2]M$ then by inversion $T + [\sigma_1]P \ge [\sigma_2]P$ and $T + [\sigma_1]M \le [\sigma_2]M$.

Applying the induction hypothesis to $T \vdash [\sigma_1] \stackrel{P}{>} [\sigma_2] \stackrel{P}{>}$ and to $T \vdash [\sigma_1] \stackrel{M}{\sim} [\sigma_2] \stackrel{M}{>}$, we obtain (respectively):

$$T \vdash \sigma_i \simeq^{\leqslant} \mathrm{id} : \mathrm{fv} P$$
 (3)

$$T \vdash \sigma_i \simeq^{\leqslant} \mathsf{id} : \mathsf{fv} \, M$$
 (4)

Noting that $\mathbf{fv}(P \to M) = \mathbf{fv}P \cup \mathbf{fv}M$, we combine eqs. (3) and (4) to conclude: $T \vdash \sigma_i \simeq^{\leq}$ $id : fv (P \rightarrow M).$

Case 4. $N = \uparrow P$

Then by inversion, $T \vdash P$. $T \vdash [\sigma_1]N \leq [\sigma_2]N$ is rewritten as $T \vdash [\sigma_1] \uparrow P \leq [\sigma_2] \uparrow P$, then by congruence of substitution and by inversion, $T \vdash [\sigma_1]P \geqslant [\sigma_2]P$

Applying the induction hypothesis to $T \vdash [\sigma_1]P \ge [\sigma_2]P$, we obtain $T \vdash \sigma_i \simeq^{\varsigma} id : \text{fv } P$ Since $\operatorname{fv} \uparrow P = \operatorname{fv} P$, we can conclude: $T \vdash \sigma_i \simeq^{\leq} \operatorname{id} : \operatorname{fv} \uparrow P$.

Case 5. The positive cases are proved symmetrically.

Corollary 11 (Substitution cannot induce proper subtypes or supertypes). Assuming all mentioned types are well-formed in T and σ is a substitution $T \vdash \sigma : T$,

```
T \vdash [\sigma] N \leq N \implies T \vdash [\sigma] N \simeq^{\leq} N \text{ and } T \vdash \sigma \simeq^{\leq} \text{id} : \text{fv } N
T \vdash N \leq [\sigma]N \implies T \vdash N \simeq^{\leq} [\sigma]N \text{ and } T \vdash \sigma \simeq^{\leq} \text{id} : \text{fv } N
  T \vdash [\sigma] P \geqslant P \Rightarrow T \vdash [\sigma] P \simeq^{\leq} P \text{ and } T \vdash \sigma \simeq^{\leq} \text{id} : \text{fv } P
  T \vdash P \geqslant [\sigma]P \implies T \vdash P \simeq^{\leqslant} [\sigma]P \text{ and } T \vdash \sigma \simeq^{\leqslant} \text{id} : \text{fv } P
```

Lemma 29 (Mutual substitution and subtyping). Assuming that the mentioned types (P, Q, N, andM) are well-formed in T and that the substitutions (σ_1 and σ_2) have signature $T \vdash \sigma_i : T$,

- + if $T \vdash [\sigma_1]P \geqslant Q$ and $T \vdash [\sigma_2]Q \geqslant P$ then there exists a bijection $\mu: \mathbf{fv} \overset{P}{\longrightarrow} \mathbf{fv} \overset{Q}{\bigcirc}$ such that $T \vdash \sigma_1 \simeq^{\leqslant} \mu: \mathbf{fv} \overset{P}{\longrightarrow} and T \vdash \sigma_2 \simeq^{\leqslant} \mu^{-1}$
- $-ifT \vdash [\sigma_1]N \leq M \text{ and } T \vdash [\sigma_2]N \leq M$ then there exists a bijection $\mu: \mathbf{fv} \ M \hookrightarrow \mathbf{fv} \ M$ such that $T \vdash \sigma_1 \simeq^{\leqslant} \mu: \mathbf{fv} \ N$ and $T \vdash \sigma_2 \simeq^{\leqslant} \mu^{-1}$ fv M.

Proof.

+ Applying σ_2 to both sides of $T \vdash [\sigma_1]P \geqslant Q$ (by lemma 21), we have: $T \vdash [\sigma_2 \circ \sigma_1]P \geqslant [\sigma_2]Q$ Composing it with $T \vdash [\sigma_2]Q \geqslant P$ by transitivity (lemma 22), we have $T \vdash [\sigma_2 \circ \sigma_1]P \geqslant P$ Then by corollary 11, $T \vdash \sigma_2 \circ \sigma_1 \simeq^{\leq} id : \text{fy } P$. By a symmetric argument, we also have $T \vdash \sigma_1 \circ \sigma_2 \simeq^{\leq} id : \mathbf{fv} \mathcal{O}.$

Now, we prove that $T \vdash \sigma_2 \circ \sigma_1 \simeq^{\leq} id : \mathbf{fv} P$ and $T \vdash \sigma_1 \circ \sigma_2 \simeq^{\leq} id : \mathbf{fv} Q$ implies that σ_1 and σ_1 are (equivalent to) mutually inverse bijections.

To do so, it suffices to prove that

- (i) for any $\alpha^{\pm} \in \mathbf{fv} P$ there exists $\beta^{\pm} \in \mathbf{fv} Q$ such that $T \vdash [\sigma_1] \alpha^{\pm} \simeq \beta^{\pm}$ and $T \vdash [\sigma_2] \beta^{\pm} \simeq \beta^{\pm}$ α^{\pm} ; and
- (ii) for any $\beta^{\pm} \in \mathbf{fv} \ Q$ there exists $\alpha^{\pm} \in \mathbf{fv} \ P$ such that $T \vdash [\sigma_2] \beta^{\pm} \simeq \alpha^{\pm}$ and $T \vdash [\sigma_1] \alpha^{\pm} \simeq \alpha^{\pm}$

Then these correspondences between fy P and fy O are mutually inverse functions, since for any β^{\pm} there can be at most one α^{\pm} such that $T \vdash [\sigma_2] \beta^{\pm} \simeq^{\leqslant} \alpha^{\pm}$ (and vice versa).

- (i) Let us take $\alpha^{\pm} \in \mathbf{fv} P$.
 - (a) if α^{\pm} is positive $(\alpha^{\pm} = \alpha^{+})$, from $T \vdash [\sigma_{2}][\sigma_{1}]\alpha^{+} \simeq \alpha^{+}$, by corollary 8, we have $[\sigma_2][\sigma_1]\alpha^+ = \exists \beta^-. \alpha^+.$

What shape can $[\sigma_1]\alpha^+$ have? It cannot be $\exists \overrightarrow{\alpha}^-$. $\downarrow N$ (for potentially empty $\overrightarrow{\alpha}^-$) because the outer constructor \downarrow would remain after the substitution σ_2 , whereas $\exists \beta^{-}$. α^{+} does not have \downarrow . The only case left is $[\sigma_{1}]\alpha^{+} = \exists \alpha^{-}$. γ^{+} .

Notice that $T \vdash \exists \overrightarrow{\alpha}^{-}$. $\gamma^{+} \simeq^{\leqslant} \gamma^{+}$, meaning that $T \vdash [\sigma_{1}] \alpha^{+} \simeq^{\leqslant} \gamma^{+}$. Also notice that $[\sigma_2] \exists \overrightarrow{\alpha}^-$. $y^+ = \exists \overrightarrow{\beta}^-$. α^+ implies $T + [\sigma_2] y^+ \simeq \alpha^+$.

(b) if α^{\pm} is negative $(\alpha^{\pm} = \alpha^{-})$ from $T \vdash [\sigma_{2}][\sigma_{1}]\alpha^{-} \simeq \alpha^{-}$, by corollary 8, we have $[\sigma_{2}][\sigma_{1}]\alpha^{-} = \forall \beta^{+}, \alpha^{-}$. What shape can $[\sigma_{1}]\alpha^{-}$ have? It cannot be $\forall \alpha^{+}, \uparrow P$ nor $\forall \alpha^{+}, P \to M$ (for potentially empty α^{+}), because the outer constructor $(\to \text{ or } \uparrow)$, remaining after the substitution σ_{2} , is however absent in the resulting $\forall \beta^{+}, \alpha^{-}$. Hence, the only case left is $[\sigma_{1}]\alpha^{-} = \forall \alpha^{+}, \gamma^{-}$ Notice that $T \vdash \gamma^{-} \simeq \forall \alpha^{+}, \gamma^{-}$, meaning that $T \vdash [\sigma_{1}]\alpha^{-} \simeq \gamma^{-}$. Also notice that $[\sigma_{2}]\forall \alpha^{+}, \gamma^{-} = \forall \beta^{+}, \alpha^{-}$ implies $T \vdash [\sigma_{2}]\gamma^{-} \simeq \alpha^{-}$.

- (ii) The proof is symmetric: We swap P and Q, σ_1 and σ_2 , and exploit $T \vdash [\sigma_1][\sigma_2]\alpha^{\pm} \simeq^{\leqslant} \alpha^{\pm}$ instead of $T \vdash [\sigma_2][\sigma_1]\alpha^{\pm} \simeq^{\leqslant} \alpha^{\pm}$.
- The proof is symmetric to the positive case.

Lemma 30 (Equivalent substitution act equivalently). Suppose that $T' \vdash \sigma_1 : T$ and $T' \vdash \sigma_2 : T$ are substitutions equivalent on their domain, that is $T' \vdash \sigma_1 \simeq^{\leq} \sigma_2 : T$. Then

```
+ for any T \vdash P, T' \vdash [\sigma_1]P \simeq^{\leqslant} [\sigma_2]P;

- for any T \vdash N, T' \vdash [\sigma_1]N \simeq^{\leqslant} [\sigma_2]N.
```

PROOF. We prove it by induction on P (and mutually on N).

Case 1. $N = \alpha^-$

Then since by inversion, $\alpha^- \in T$, $T' \vdash [\sigma_1]\alpha^- \simeq^{\leqslant} [\sigma_2]\alpha^-$ holds by definition of $T' \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : T$.

Case 2. $N = \uparrow P$

Then by inversion, $T \vdash P$. By the induction hypothesis, $T' \vdash [\sigma_1]P \simeq^{\leqslant} [\sigma_2]P$, Then by (\uparrow^{\leqslant}) , $T' \vdash \uparrow [\sigma_1]P \leqslant \uparrow [\sigma_2]P$, and symmetrically, $T' \vdash \uparrow [\sigma_2]P \leqslant \uparrow [\sigma_1]P$, together meaning that $T' \vdash \uparrow [\sigma_1]P \simeq^{\leqslant} \uparrow [\sigma_2]P$, or equivalently, $T' \vdash [\sigma_1]\uparrow P \simeq^{\leqslant} [\sigma_2]\uparrow P$.

Case 3. $N = P \rightarrow M$

Then by inversion, $T \vdash P$ and $T \vdash M$. By the induction hypothesis, $T' \vdash [\sigma_1]P \simeq^{\varsigma} [\sigma_2]P$ and $T' \vdash [\sigma_1]M \simeq^{\varsigma} [\sigma_2]M$, that is $T' \vdash [\sigma_1]P \geqslant [\sigma_2]P$, $T' \vdash [\sigma_2]P \geqslant [\sigma_1]P$, $T' \vdash [\sigma_1]M \leqslant [\sigma_2]M$, and $T' \vdash [\sigma_2]M \leqslant [\sigma_1]M$. Then by (\to^{ς}) , $T' \vdash [\sigma_1]P \to [\sigma_1]M \leqslant [\sigma_2]P \to [\sigma_2]M$, and again by (\to^{ς}) , $T' \vdash [\sigma_2]P \to [\sigma_2]M \leqslant [\sigma_1]P \to [\sigma_1]M$. This way, $T' \vdash [\sigma_1]P \to [\sigma_1]M \simeq^{\varsigma} [\sigma_2]P \to [\sigma_2]M$, or equivalently, $T' \vdash [\sigma_1](P \to M) \simeq^{\varsigma} [\sigma_2](P \to M)$.

Case 4. $N = \forall \overrightarrow{\alpha^+}$. M We can assume that $\overrightarrow{\alpha^+}$ is disjoint from T and T'. By inversion, $T \vdash \forall \overrightarrow{\alpha^+}$. M implies $T, \overrightarrow{\alpha^+} \vdash M$. Notice that $T' \vdash \sigma_i : T$ and $T' \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : T$ can be extended to $T', \overrightarrow{\alpha^+} \vdash \sigma_i : T, \overrightarrow{\alpha^+}$ and $T', \overrightarrow{\alpha^+} \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : T, \overrightarrow{\alpha^+}$ by lemma 12. Then by the induction hypothesis, $T', \overrightarrow{\alpha^+} \vdash [\sigma_1]M \simeq^{\leqslant} [\sigma_2]M$, meaning by inversion that $T', \overrightarrow{\alpha^+} \vdash [\sigma_1]M \leqslant [\sigma_2]M$ and $T', \overrightarrow{\alpha^+} \vdash [\sigma_2]M \leqslant [\sigma_1]M$.

To infer $T' \vdash \forall \alpha^+$. $[\sigma_1]M \leqslant \forall \alpha^+$. $[\sigma_2]M$, we apply (\forall^{\leqslant}) with the substitution $T', \alpha^+ \vdash \text{id} : \alpha^+$, noting that $T', \alpha^+ \vdash [\text{id}][\sigma_1]M \leqslant [\sigma_2]M$ holds since $T', \alpha^+ \vdash [\sigma_1]M \leqslant [\sigma_2]M$, as noted above.

Symmetrically, we infer $T' \vdash \forall \overrightarrow{\alpha^+}$. $[\sigma_2]M \leq \forall \overrightarrow{\alpha^+}$. $[\sigma_1]M$, which together with $T' \vdash \forall \overrightarrow{\alpha^+}$. $[\sigma_1]M \leq \forall \overrightarrow{\alpha^+}$. $[\sigma_2]M$ means $T' \vdash \forall \overrightarrow{\alpha^+}$. $[\sigma_1]M \simeq^{<} \forall \overrightarrow{\alpha^+}$. $[\sigma_2]M$, or equivalently, $T' \vdash [\sigma_1] \forall \overrightarrow{\alpha^+}$. $M \simeq^{<} [\sigma_2] \forall \overrightarrow{\alpha^+}$. M.

Case 5. The positive cases are proved symmetrically.

- For $T \vdash \forall \overrightarrow{\alpha^+}$. N and $T \vdash \forall \overrightarrow{\beta^+}$. M, if $T \vdash \forall \alpha^{+}$. $N \simeq \forall \beta^{+}$. M then there exists a bijection $\mu : \beta^{+} \cap \text{fv } M \leftrightarrow \alpha^{+} \cap \text{fv } N$ such that $T, \overrightarrow{\alpha^+} \vdash N \simeq^{\leq} [\mu]M,$

+ For $T \vdash \exists \overrightarrow{\alpha}$. \overrightarrow{P} and $T \vdash \exists \overrightarrow{\beta}$. \overrightarrow{Q} , if $T \vdash \exists \overrightarrow{\alpha}^{-}$. $P \simeq \exists \overrightarrow{\beta}^{-}$. Q then there exists a bijection $\mu : \overrightarrow{\beta}^{-} \cap \text{fv } Q \leftrightarrow \overrightarrow{\alpha}^{-} \cap \text{fv } P$ such that $T. \overrightarrow{\beta^2} \vdash P \simeq^{\leqslant} [\mu]Q.$

Proof.

- First, by α -conversion, we ensure $\overrightarrow{\alpha}^+ \cap \text{fv } M = \emptyset$ and $\overrightarrow{\beta}^+ \cap \text{fv } N = \emptyset$. By inversion, $T \vdash$ $\forall \overrightarrow{\alpha^+}$. $N \simeq^{\leq} \forall \overrightarrow{\beta^+}$. M implies
 - (1) $T, \overrightarrow{\beta^+} \vdash [\sigma_1] N \leq M \text{ for } T, \overrightarrow{\beta^+} \vdash \sigma_1 : \overrightarrow{\alpha^+} \text{ and }$
 - (2) $T, \overrightarrow{\alpha^+} \vdash [\sigma_2]M \leq N \text{ for } T, \overrightarrow{\alpha^+} \vdash \sigma_2 : \overrightarrow{\beta^+}.$

To apply lemma 29, we weaken and rearrange the contexts, and extend the substitutions to act as identity outside of their initial domain:

- (1) $T, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{+}} \vdash [\sigma_{1}]N \leq M \text{ for } T, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{+}} \vdash \sigma_{1} : T, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{+}} \text{ and}$ (2) $T, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{+}} \vdash [\sigma_{2}]M \leq N \text{ for } T, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{+}} \vdash \sigma_{2} : T, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{+}}.$

Then from lemma 29, there exists a bijection $\mu : \mathbf{fv} \ M \leftrightarrow \mathbf{fv} \ N$ such that $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \sigma_2 \simeq 0$ $\mu : \text{fv } M \text{ and } T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \sigma_1 \simeq^{\leqslant} \mu^{-1} : \text{fv } N.$

Let us show that $\mu|_{\overrightarrow{R^2}}$ is the appropriate candidate.

First, we show that if we restrict the domain of μ to $\overrightarrow{\beta^+}$, its range will be contained in $\overrightarrow{\alpha^+}$. Let us take $\gamma^+ \in \overrightarrow{\beta^+} \cap \text{fv } M$ and assume $[\mu] \gamma^+ \notin \overrightarrow{\alpha^+}$. Then since $T, \overrightarrow{\beta^+} \vdash \sigma_1 : \overrightarrow{\alpha^+}, \sigma_1$ acts as identity outside of $\overrightarrow{\alpha^+}$, i.e. $[\sigma_1][\mu]\gamma^+ = [\mu]\gamma^+$ (notice that γ^+ is in the domain of μ). Since $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \sigma_1 \simeq^{\leqslant} \mu^{-1}$: fv N, application of σ_1 to $[\mu]_{\gamma^+} \in \text{fv } N$ is equivalent to application of μ^{-1} , then $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash [\mu^{-1}][\mu]_{\gamma^+} \simeq^{\leqslant} [\mu]_{\gamma^+}$, i.e. $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \gamma^+ \simeq^{\leqslant} [\mu]_{\gamma^+}$, which means $\gamma^+ \in \text{fv} [\mu] \gamma^+ \subseteq \text{fv } N$. By assumption, $\gamma^+ \in \overrightarrow{\beta^+} \cap \text{fv } M$, i.e. $\overrightarrow{\beta^+} \cap \text{fv } N \neq \emptyset$, hence contradiction Second, we will show $T, \overrightarrow{\alpha^+} \vdash N \simeq^{\leq} [\mu|_{\overrightarrow{\beta^+}}]M$.

Since $T, \overrightarrow{\alpha^+} \vdash \sigma_2 : \overrightarrow{\beta^+}$ and $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \sigma_2 \simeq^{\leqslant} \mu : \text{fv } M$, we have $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \sigma_2 \simeq^{\leqslant} \mu|_{\overrightarrow{B}} : \text{fv } M$ for any $\alpha^{\pm} \in \mathbf{fv} \, M \setminus \overrightarrow{\beta^{+}}, [\sigma_{2}] \alpha^{\pm} = \alpha^{\pm} \text{ since } T, \overrightarrow{\alpha^{+}} \vdash \sigma_{2} : \overrightarrow{\beta^{+}}, \text{ and } [\mu|_{\overrightarrow{\beta^{+}}}] \alpha^{\pm} = \alpha^{\pm} \text{ by definition}$ of substitution restriction; for $\beta^+ \in \overrightarrow{\beta^+}$, $[\mu|_{\overrightarrow{\beta^+}}]\beta^+ = [\mu]\beta^+$, and thus, $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash [\sigma_2]\beta^+ \simeq \emptyset$ $[\mu]^{\beta^+}$ can be rewritten to $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash [\sigma_2]^{\beta^+} \simeq [\mu]_{\overrightarrow{\beta^+}}]^{\beta^+}$.

By lemma 30, T, $\overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}$ $\vdash \sigma_2 \simeq^{\leqslant} \mu|_{\overrightarrow{\beta^+}} : \text{fv } M \text{ implies } T$, $\overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}$ $\vdash [\sigma_2]M \simeq^{\leqslant} [\mu|_{\overrightarrow{\beta^+}}]M$. By similar reasoning, $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash [\sigma_1]N \simeq^{\leq} [\mu^{-1}] \stackrel{\longrightarrow}{\longrightarrow} N$.

This way, by transitivity of subtyping (lemma 22),

$$T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash [\mu^{-1}|_{\overrightarrow{\alpha^+}}]N \leq M$$
 (5)

$$T, \overrightarrow{\alpha^{\dagger}}, \overrightarrow{\beta^{\dagger}} \vdash [\mu|_{\overrightarrow{\beta^{\dagger}}}]M \leqslant N$$
 (6)

By applying $\mu|_{\overrightarrow{\beta^{\ddagger}}}$ to both sides of 5 (lemma 21), we have $T, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{+}} \vdash [\mu|_{\overrightarrow{\beta^{\ddagger}}}][\mu^{-1}|_{\overrightarrow{\alpha^{+}}}]N \leq$ $[\mu|_{\overrightarrow{\beta^{\dagger}}}]M$. By contracting $\mu^{-1}|_{\overrightarrow{\alpha^{\dagger}}} \circ \mu|_{\overrightarrow{\beta^{\dagger}}} = \mu|_{\overrightarrow{\beta^{\dagger}}}^{-1} \circ \mu|_{\overrightarrow{\beta^{\dagger}}}$ (notice that $\mathbf{fv} \ N \cap \overrightarrow{\beta^{\dagger}} = \emptyset$), we have $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash N \leqslant [\mu|_{\overrightarrow{\beta^+}}]M$, which together with 6 means $T, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash N \simeq^{\leqslant} [\mu|_{\overrightarrow{\beta^+}}]M$, and by strengthening, $T, \overrightarrow{\alpha^+} \vdash N \simeq^{\leq} [\mu|_{\overrightarrow{B^+}}]M$.

+ The proof is symmetric to the proof of the negative case.

Lemma 32 (Completeness of Equivalence). Mutual subtyping implies declarative equivalence.

Assuming all the types below are well-formed in T:

+ $if T \vdash P \simeq^{<} Q$ then $P \simeq^{D} Q$,

- $if T \vdash N \simeq^{<} M$ then $N \simeq^{D} M$.

PROOF. – Induction on the sum of sizes of N and M. By inversion, $T \vdash N \cong^{\leqslant} M$ means $T \vdash N \leqslant M$ and $T \vdash M \leqslant N$. Let us consider the last rule that forms $T \vdash N \leqslant M$:

Case 1. (VAR $^{\leq}$) i.e. $T \vdash N \leq M$ is of the form $T \vdash \alpha^{-} \leq \alpha^{-}$ Then $N \simeq^{D} M$ (i.e. $\alpha^{-} \simeq^{D} \alpha^{-}$) holds immediately by (VAR $^{\simeq^{D}}$).

Case 2. (\uparrow^{\leq}) i.e. $T \vdash N \leq M$ is of the form $T \vdash \uparrow P \leq \uparrow Q$ Then by inversion, $T \vdash P \simeq^{\leq} Q$, and by induction hypothesis, $P \simeq^{D} Q$. Then $N \simeq^{D} M$ (i.e. $\uparrow P \simeq^{D} \uparrow Q$) holds by $(\uparrow^{\simeq D})$.

Case 3. (→[≤]) i.e. $T \vdash N \le M$ is of the form $T \vdash P \to N' \le Q \to M'$ Then by inversion, $T \vdash P \ge Q$ and $T \vdash N' \le M'$. Notice that $T \vdash M \le N$ is of the form $T \vdash Q \to M' \le P \to N'$, which by inversion means $T \vdash Q \ge P$ and $T \vdash M' \le N'$. This way, $T \vdash Q \cong P$ and $T \vdash M' \cong N'$. Then by induction hypothesis, $Q \cong^D P$ and $T \vdash M' \cong^D N'$. Then $T \vdash N' \cong^D N' \cong^D N'$ holds by $T \vdash N' \cong^D N'$.

Case 4. (\forall^{\leq}) i.e. $T \vdash N \leq M$ is of the form $T \vdash \forall \overrightarrow{\alpha^{+}}. N' \leq \forall \overrightarrow{\beta^{+}}. M'$ Then by lemma 31, $T \vdash \forall \overrightarrow{\alpha^{+}}. N' \simeq^{\leq} \forall \overrightarrow{\beta^{+}}. M'$ means that there exists a bijection $\mu : \overrightarrow{\beta^{+}} \cap \text{fv } M' \leftrightarrow \overrightarrow{\alpha^{+}} \cap \text{fv } N'$ such that $T, \overrightarrow{\alpha^{+}} \vdash [\mu]M' \simeq^{\leq} N'$.

Notice that the application of bijection μ to M' does not change its size (which is less than the size of M), hence the induction hypothesis applies. This way, $[\mu]M' \simeq^D N'$ (and by symmetry, $N' \simeq^D [\mu]M'$) holds by induction. Then we apply (\forall^{\simeq^D}) to get $\forall \overrightarrow{\alpha}^+$, $N' \simeq^D \forall \overrightarrow{\beta}^+$, M', i.e. $N \simeq^D M$.

+ The proof is symmetric to the proof of the negative case.

2988 2989 **Observation 1** (Ordering is deterministic). If ord vars in $N = \vec{\alpha}_1$ and ord vars in $N = \vec{\alpha}_2$ then $\vec{\alpha}_1 = \vec{\alpha}_2$. If ord vars in $P = \vec{\alpha}_1$ and ord vars in $P = \vec{\alpha}_2$ then $\vec{\alpha}_1 = \vec{\alpha}_2$. This way, we can use ord vars in N and as a function on N, and ord vars in N as a function on N.

PROOF. By mutual structural induction on N and P. Notice that the shape of the term N or P uniquely determines the last used inference rule, and all the premises are deterministic on the input.

Lemma 33 (Soundness of variable ordering). *Variable ordering extracts used free variables*.

- ord vars in $N = vars \cap fv N$ (as sets)
- + ord vars in $P = vars \cap fv P$ (as sets)

PROOF. We prove it by mutual induction on **ord** vars in $N = \vec{\alpha}$ and **ord** vars in $P = \vec{\alpha}$. The only non-trivial cases are (\rightarrow^{ORD}) and (\forall^{ORD}) .

Case 1. (\to^{ORD}) Then the inferred ordering judgement has shape **ord** vars in $P \to N = \vec{\alpha}_1$, $(\vec{\alpha}_2 \setminus \vec{\alpha}_1)$ and by inversion, **ord** vars in $P = \vec{\alpha}_1$ and **ord** vars in $N = \vec{\alpha}_2$. By definition of free variables, $vars \cap \mathbf{fv} P \to N = vars \cap \mathbf{fv} P \cup vars \cap \mathbf{fv} N$, and since by the induction hypothesis $vars \cap \mathbf{fv} P = \vec{\alpha}_1$ and $vars \cap \mathbf{fv} N = \vec{\alpha}_2$, we have $vars \cap \mathbf{fv} P \to N = \vec{\alpha}_1 \cup \vec{\alpha}_2$.

3008

3013 3014 3015

3024 3025 3026

3027 3028 3029

3030 3031 3032

3038

On the other hand, As a set, $\vec{\alpha}_1 \cup \vec{\alpha}_2$ is equal to $\vec{\alpha}_1$, $(\vec{\alpha}_2 \setminus \vec{\alpha}_1)$.

Case 2. (\forall^{ORD}) . Then the inferred ordering judgement has shape ord vars in $\forall \alpha^{+}$. $N = \vec{\alpha}$, and by inversion, $vars \cap \overrightarrow{\alpha}^+ = \emptyset$ ord vars in $N = \overrightarrow{\alpha}$. The latter implies that $vars \cap fv$ $N = \overrightarrow{\alpha}$. We need to show that $vars \cap fv \forall \overrightarrow{\alpha^+}$. $N = \overrightarrow{\alpha}$, or equivalently, that $vars \cap (fv N \backslash \overrightarrow{\alpha^+}) = vars \cap fv N$ which holds since $vars \cap \overrightarrow{\alpha^+} = \emptyset$.

Corollary 12 (Additivity of ordering). *Variable ordering is additive (in terms of set union) with* respect to its first argument.

- ord $(vars_1 \cup vars_2)$ in N =ord $vars_1$ in $N \cup$ ord $vars_2$ in N (as sets)
- + ord $(vars_1 \cup vars_2)$ in P =ord $vars_1$ in $P \cup$ ord $vars_2$ in P (as sets)

Lemma 34 (Weakening of ordering). Only used variables matter in the first argument of the ordering

- ord (vars \cap fv N) in N = ord vars in N
- + ord $(vars \cap fv P)$ in P = ord vars in P

PROOF. Mutual structural induction on N and P.

- **Case 1.** If *N* is a variable α^- , we notice that $\alpha^- \in vars$ is equivalent to $\alpha^- \in vars \cap \alpha^-$.
- **Case 2.** If N has shape $\uparrow P$, then the required property holds immediately by the induction hypothesis, since $\mathbf{fv} (\uparrow P) = \mathbf{fv} (P)$.
- **Case 3**. If the term has shape $P \to N$ then (\to^{ORD}) was applied to infer ord $(vars \cap (fvP))$ fv N)) in $P \to N$ and ord vars in $P \to N$. By inversion, the result of ord (vars \cap (fv $P \cup$ fv N) in $P \to N$ depends on $A = \operatorname{ord}(vars \cap (\operatorname{fv} P \cup \operatorname{fv} N))$ in P and $B = \operatorname{ord}(vars \cap P \cup \operatorname{fv} N)$ $(\mathbf{fv} P \cup \mathbf{fv} N))$ in N. The result of ord vars in $P \to N$ depends on $X = \mathbf{ord} \ vars$ in P and Y =ord varsin N.

Let us show that A = B and X = Y, so the results are equal. By the induction hypothesis and set properties, ord $(vars \cap (fv P \cup fv N))$ in $P = ord (vars \cap (fv P \cup fv N)) \cap fv (P)$ in $P = ord (vars \cap (fv P \cup fv N)) \cap fv (P)$ in $P = ord (vars \cap (fv P \cup fv N)) \cap fv (P)$ ord $vars \cap fv(P)$ in P = ord vars in P. Analogously, ord $(vars \cap (fv P \cup fv N))$ in N = ord varsord vars in N.

Case 4. If the term has shape $\forall \overrightarrow{\alpha}^+$. N, we can assume that $\overrightarrow{\alpha}^+$ is disjoint from vars, since we operate on alpha-equivalence classes. Then using the induction hypothesis, set properties and (\forall^{ORD}) : ord $vars \cap (fv(\forall \alpha^+, N))$ in $\forall \alpha^+, N = ord vars \cap (fv(N) \setminus \alpha^+)$ in $N = ord vars \cap (fv(N) \setminus \alpha^+)$ $(\operatorname{fv}(N) \setminus \overline{\alpha^{+}}) \cap \operatorname{fv}(N) \text{ in } N = \operatorname{ord} \operatorname{vars} \cap \operatorname{fv}(N) \text{ in } N = \operatorname{ord} \operatorname{vars} \text{ in } N.$

Corollary 13 (Idempotency of ordering).

- If ord vars in $N = \vec{\alpha}$ then ord $\vec{\alpha}$ in $N = \vec{\alpha}$,
- + If ord vars in $P = \vec{\alpha}$ then ord $\vec{\alpha}$ in $P = \vec{\alpha}$;

PROOF. By lemmas 33 and 34.

Next, we make a set-theoretical observation that will be useful further. In general, any injective function (its image) distributes over the set intersection. However, for convenience, we allow the bijections on variables to be applied outside of their domains (as identities), which may violate the injectivity. To deal with these cases, we define a special notion of bijections collision-free on certain sets in such a way that a bijection that is collision-free on P and Q, distributes over intersection of

Definition 29 (Collision-free bijection). We say that a bijection $\mu: A \leftrightarrow B$ between sets of variables is **collision-free on sets** P and O if and only if

```
(1) \mu(P \cap A) \cap Q = \emptyset
3039
               (2) \mu(Q \cap A) \cap P = \emptyset
3040
3041
         Observation 15. Suppose that \mu: A \leftrightarrow B is a bijection between two sets of variables, and \mu is
3042
         collision-free on P and Q. Then \mu(P \cap Q) = \mu(P) \cap \mu(Q).
3043
3044
         Lemma 35 (Distributivity of renaming over variable ordering). Suppose that \mu is a bijection between
3045
          two sets of variables \mu: A \leftrightarrow B.
3046
3047
                - If \mu is collision-free on vars and fv N then [\mu] (ord vars in N) = ord ([\mu] vars) in [\mu] N
3048
                + If \mu is collision-free on vars and \operatorname{fv} P then [\mu](\operatorname{ord} \operatorname{vars} \operatorname{in} P) = \operatorname{ord}([\mu]\operatorname{vars}) \operatorname{in}[\mu]P
3049
3050
             PROOF. Mutual induction on N and P.
3051
                 Case 1. N = \alpha^{-}
3052
                    let us consider four cases:
3053
                       a. \alpha^- \in A and \alpha^- \in vars
3054
                           Then
3055
                            [\mu](\text{ord } vars \text{ in } N) = [\mu](\text{ord } vars \text{ in } \alpha^{-})
3056
                                                                                              by (VAR_+C)
                                                        = [\mu]\alpha^{-}
3058
                                                        =\beta^{-}
                                                                                              for some \beta^- \in B (notice \beta^- \in [\mu] vars)
3059
                                                        = ord [\mu] vars in \beta^-
                                                                                             by (VAR_{+\epsilon}^{ORD}), because \beta^- \in [\mu] vars
                                                        = ord [\mu] vars in [\mu]\alpha^-
                       b. \alpha^- \notin A and \alpha^- \notin vars
3062
                           Notice that [\mu](\text{ord } vars \text{in } N) = [\mu](\text{ord } vars \text{in } \alpha^-) = \cdot \text{ by } (VAR_{+\theta}^{ORD}). On the other
                           hand, ord [\mu] vars in [\mu]\alpha^- = \text{ord } [\mu] vars in \alpha^- = \cdot The latter equality is from (VAR_{+\notin}^{ORD})
                            because \mu is collision-free on vars and fv N, so fv N \ni \alpha^- \notin \mu(A \cap vars) \cup vars \supseteq [\mu] vars
3066
                       c. \alpha^- \in A but \alpha^- \notin vars
                           Then [\mu](\text{ord } vars \text{ in } N) = [\mu](\text{ord } vars \text{ in } \alpha^-) = \cdot \text{ by } (\text{VAR}^{ORD}_{+\notin}). To prove that
                           ord [\mu] vars in [\mu]\alpha^- = \cdot, we apply (VAR^{ORD}_{+\not\in}). Let us show that [\mu]\alpha^- \notin [\mu] vars. Since
3068
                            [\mu]\alpha^- = \mu(\alpha^-) and [\mu]vars \subseteq \mu(A \cap vars) \cup vars, it suffices to prove \mu(\alpha^-) \notin \mu(A \cap vars)
3070
                            vars) \cup vars.
3071
                               (i) If there is an element x \in A \cap vars such that \mu x = \mu \alpha^-, then x = \alpha^- by bijectivity
3072
                                     of \mu, which contradicts with \alpha^- \notin vars. This way, \mu(\alpha^-) \notin \mu(A \cap vars).
                              (ii) Since \mu is collision-free on vars and \operatorname{fv} N, \mu(A \cap \operatorname{fv} N) \ni \mu(\alpha^-) \notin vars.
3074
                       d. \alpha^- \notin A \text{ but } \alpha^- \in vars
3075
                           ord [\mu] vars in [\mu] \alpha^- = \text{ord } [\mu] vars in \alpha^- = \alpha^-. The latter is by (VAR_{+\theta}^{ORD}), because
3076
                            \alpha^- = [\mu] \alpha^- \in [\mu] \text{ vars since } \alpha^- \in \text{vars. On the other hand, } [\mu] (\text{ord vars in } N) =
3077
                            [\mu](\text{ord } vars \text{ in } \alpha^-) = [\mu]\alpha^- = \alpha^-.
3078
                 Case 2. N = \uparrow P
3079
                     [\mu] (ord vars in N) = [\mu] (ord vars in \uparrow P)
3080
                                                 = [\mu] (\text{ord } vars \text{ in } P)
                                                                                      by (↑<sup>ORD</sup>)
3081
                                                 = ord [\mu] vars in [\mu]
                                                                                      by the induction hypothesis
3082
3083
                                                                                      by (↑<sup>ORD</sup>)
                                                 = ord [\mu] vars in \uparrow [\mu] P
3084
                                                 = ord [\mu] vars in [\mu] \uparrow P
                                                                                      by the definition of substitution
3085
                                                 = ord [\mu] vars in [\mu]N
3086
```

```
Case 3. N = P \rightarrow M
     [\mu] (ord vars in N)
      = [\mu] (\text{ord } vars \text{ in } P \to M)
      = [\mu](\overrightarrow{\alpha}_1, (\overrightarrow{\alpha}_2 \setminus \overrightarrow{\alpha}_1))
                                                                   where ord vars in P = \vec{\alpha}_1 and ord vars in M = \vec{\alpha}_2
      = [\mu] \overrightarrow{\alpha}_1, [\mu] (\overrightarrow{\alpha}_2 \setminus \overrightarrow{\alpha}_1)
      = [\mu] \overrightarrow{\alpha}_1, ([\mu] \overrightarrow{\alpha}_2 \setminus [\mu] \overrightarrow{\alpha}_1)
                                                                  by induction on \vec{\alpha}_2; the inductive step is similar to case 1.
                                                                   Notice that \mu is collision free on \vec{\alpha}_1 and \vec{\alpha}_2
                                                                   since \vec{\alpha}_1 \subseteq vars and \vec{\alpha}_2 \subseteq \mathbf{fv} N
      = [\mu] \overrightarrow{\alpha}_1, ([\mu] \overrightarrow{\alpha}_2 \setminus [\mu] \overrightarrow{\alpha}_1)
     On the other hand,
     ord [\mu] vars in [\mu]N
      = ord [\mu] vars in [\mu]P \rightarrow [\mu]M
      = \overrightarrow{\beta}_1, (\overrightarrow{\beta}_2 \setminus \overrightarrow{\beta}_1)
                                                                           where ord [\mu] vars in [\mu] \stackrel{?}{P} = \overrightarrow{\beta}_1 and
                                                                           ord [\mu] vars in [\mu]M = \overrightarrow{\beta}_2; then by the induction
                                                                           hypothesis, \vec{\beta}_1 = [\mu] \vec{\alpha}_1, \vec{\beta}_2 = [\mu] \vec{\alpha}_2
      = [\mu] \overrightarrow{\alpha}_1, ([\mu] \overrightarrow{\alpha}_2 \setminus [\mu] \overrightarrow{\alpha}_1)
Case 4. N = \forall \overrightarrow{\alpha^+}. M
     [\mu] (ord vars in N) = [\mu] ord vars in \forall \alpha^{+}. M
                                             = [\mu] ord vars in M
                                             = ord [\mu] vars in [\mu]M by the induction hypothesis
     (\operatorname{ord} [\mu] \operatorname{varsin} [\mu] N) = \operatorname{ord} [\mu] \operatorname{varsin} [\mu] \forall \alpha^{+}. M
                                                   = ord [\mu] vars in \forall \alpha^+. [\mu]M
                                                    = ord [\mu] vars in [\mu] M
```

Lemma 36 (Ordering is not affected by independent substitutions). Suppose that $T_2 \vdash \sigma : T_1$, i.e. σ maps variables from T_1 into types taking free variables from T_2 , and vars is a set of variables disjoint with both T_1 and T_2 , N and P are types. Then

```
- ord vars in [\sigma]N = \text{ord } vars in N + \text{ord } vars in [\sigma]P = \text{ord } vars in [\sigma]P = \text{ord } vars
```

PROOF. Mutual induction on N and P.

```
Case 1. N = \alpha^-

If \alpha^- \notin T_1 then [\sigma]\alpha^- = \alpha^- and ord vars in [\sigma]\alpha^- = ord \ vars in \alpha^-, as required. If \alpha^- \in T_1 then \alpha^- \notin vars, so ord vars in \alpha^- = \cdot. Moreover, T_2 \vdash \sigma : T_1 means \mathbf{fv}([\sigma]\alpha^-) \subseteq T_2, and thus, as a set, ord vars in [\sigma]\alpha^- = vars \cap \mathbf{fv}([\sigma]\alpha^-) \subseteq vars \cap T_2 = \cdot.

Case 2. N = \forall \alpha^+ \cdot M

We can assume \alpha^+ \cap T_1 = \emptyset and \alpha^+ \cap vars = \emptyset. Then

              Case 4. N = P \rightarrow M
                  ord vars in [\sigma]N = \text{ord } vars \text{ in } [\sigma](P \to M)
3154
                                        = ord vars in ([\sigma]P \rightarrow [\sigma]M)
                                                                                             def. of substitution
                                        = ord vars in [\sigma]_{P},
                                          (ord vars in [\sigma]M \setminus \text{ord } vars \text{ in } [\sigma]P) def. of ordering
                                        = ord vars in P.
                                          (ord vars in M \setminus ord vars in P)
                                                                                              the induction hypothesis
                                        = ord vars in P \rightarrow M
                                                                                              def. of ordering
3162
                                        = ord vars in N
3163
              Case 5. The proofs of the positive cases are symmetric.
3164
3165
                                                                                                                                       П
3166
        Lemma 37 (Completeness of variable ordering). Variable ordering is invariant under equivalence
3167
        For arbitrary vars,
3168
              - If N \simeq^D M then ord vars in N = \text{ord } vars \text{ in } M (as lists)
3169
              + If P \simeq^D Q then ord vars in P = \text{ord } vars \text{ in } Q (as lists)
3170
           PROOF. Mutual induction on N \simeq^D M and P \simeq^D O. Let us consider the rule inferring N \simeq^D M.
3171
              Case 1. (VAR_{-}^{\simeq D})
3172
3173
              Case 2. (\uparrow^{\simeq^D})
3174
              Case 3. (\rightarrow^{\simeq^D}) Then the equivalence has shape P \to N \simeq^D Q \to M, and by inversion,
3175
                  P \simeq^D O and N \simeq^D M. Then by the induction hypothesis, ord vars in P = \text{ord } vars \text{ in } O and
3176
                  ord vars in N = \text{ord } vars in M. Since the resulting ordering for P \to N and Q \to M depend
3177
                  on the ordering of the corresponding components, which are equal, the results are equal.
3178
              Case 4. (\forall^{\simeq^D}) Then the equivalence has shape \forall \alpha^+. N \simeq^D \forall \beta^+. M. and by inversion there
3179
```

exists $\mu: (\overrightarrow{\beta^+} \cap \mathbf{fv} M) \leftrightarrow (\overrightarrow{\alpha^+} \cap \mathbf{fv} N)$ such that

• $\overrightarrow{\alpha^+} \cap \text{fv } M = \emptyset \text{ and }$

• $N \simeq^D [\mu]M$

3180

3181

3182

3183

3184 3185 Let us assume that vars is disjoint from $\overrightarrow{\alpha^+}$ and $\overrightarrow{\beta^+}$ (we can always alpha-rename the bound variables). Then **ord** vars in $\forall \overrightarrow{\alpha^+}$. N =**ord** vars in N, **ord** vars in $\forall \overrightarrow{\alpha^+}$. M =**ord** vars in M and

by the induction hypothesis, **ord** vars in N = ord vars in $[\mu]M$. This way, it suffices the show that **ord** vars in $[\mu]M = ord$ vars in M. It holds by lemma 36 since vars is disjoint form the domain and the codomain of $\mu: (\overrightarrow{\beta^+} \cap \mathbf{fv} M) \leftrightarrow (\overrightarrow{\alpha^+} \cap \mathbf{fv} N)$ by assumption.

Case 5. The positive cases are proved symmetrically.

8.6 Normaliztaion

Observation 2 (Normalization is deterministic). If $\mathbf{nf}(N) = M$ and $\mathbf{nf}(N) = M'$ then M = M'. If $\mathbf{nf}(P) = Q$ and $\mathbf{nf}(P) = Q'$ then Q = Q'. This way, we can use normalization as a function.

PROOF. By straightforward induction using observation 1.

Lemma 38. Free variables are not changed by the normalization

```
- fv N = fv nf (N)
+ fv P = fv nf (P)
```

PROOF. By mutual induction on N and P. The base cases ((VAR_ NF) and (VAR $_+^{NF}$)) are trivial; the congruent cases ((\uparrow^{NF}), (\downarrow^{NF}), and (\rightarrow^{NF})) are proved by the induction hypothesis.

Let us consider the case when the term is formed by \forall , that is the normalization judgment has a shape $\operatorname{nf}(\forall \overrightarrow{\alpha^+}. N) = \forall \overrightarrow{\alpha^+}'. N'$, where by inversion $\operatorname{nf}(N) = N'$ and $\operatorname{ord} \overrightarrow{\alpha^+} \operatorname{in} N' = \overrightarrow{\alpha^+}'.$ By the induction hypothesis, $\operatorname{fv} N = \operatorname{fv} N'$. Since $\operatorname{fv}(\forall \overrightarrow{\alpha^+}. N) = \operatorname{fv} N \setminus \overrightarrow{\alpha^+}$, and $\operatorname{fv}(\forall \overrightarrow{\alpha^+}. N') = \operatorname{fv} N' \setminus \overrightarrow{\alpha^{+'}}$, it is left to show that $\operatorname{fv} N \setminus \overrightarrow{\alpha^+} = \operatorname{fv} N \setminus \overrightarrow{\alpha^+}'.$ By lemma 37, $\overrightarrow{\alpha^+}' = \overrightarrow{\alpha^+} \cap \operatorname{fv} N' = \overrightarrow{\alpha^+} \cap \operatorname{fv} N.$ Then $\operatorname{fv} N \setminus \overrightarrow{\alpha^+} = \operatorname{fv} N \setminus (\overrightarrow{\alpha^+} \cup \operatorname{fv} N)$ by set-theoretic properties, and thus, $\operatorname{fv} N \setminus \overrightarrow{\alpha^+} = \operatorname{fv} N \setminus \overrightarrow{\alpha^{+'}}.$

The case when the term is positive and formed by \exists is symmetric.

Lemma 39 (Soundness of normalization).

```
- N \simeq^D \mathbf{nf}(N) 
+ P \simeq^D \mathbf{nf}(P)
```

PROOF. Mutual induction on $\mathbf{nf}(N) = M$ and $\mathbf{nf}(P) = Q$. Let us consider how this judgment is formed:

Case 1. (VAR_*NF) and (VAR_*NF)

By the corresponding equivalence rules.

Case 2. (\uparrow^{NF}) , (\downarrow^{NF}) , and (\rightarrow^{NF})

By the induction hypothesis and the corresponding congruent equivalence rules.

Case 3.
$$(\forall^{NF})$$
, i.e. $\mathbf{nf}(\forall \alpha^{+}. N) = \forall \alpha^{+'}. N'$

From the induction hypothesis, we know that $N \simeq^D N'$. In particular, by lemma 24, $\mathbf{fv} \, N \equiv \mathbf{fv} \, N'$. Then by lemma 33, $\overrightarrow{\alpha^{+\prime}} \equiv \overrightarrow{\alpha^{+}} \cap \mathbf{fv} \, N' \equiv \overrightarrow{\alpha^{+}} \cap \mathbf{fv} \, N$, and thus, $\overrightarrow{\alpha^{+\prime}} \cap \mathbf{fv} \, N' \equiv \overrightarrow{\alpha^{+}} \cap \mathbf{fv} \, N$. To prove $\forall \overrightarrow{\alpha^{+}}, N \simeq^D \forall \overrightarrow{\alpha^{+\prime}}, N'$, it suffices to provide a bijection $\mu : \overrightarrow{\alpha^{+\prime}} \cap \mathbf{fv} \, N' \leftrightarrow \overrightarrow{\alpha^{+}} \cap \mathbf{fv} \, N$ such that $N \simeq^D [\mu] N'$. Since these sets are equal, we take $\mu = id$.

Case 4. (\exists^{NF}) Same as for case 3.

Corollary 14 (Normalization preserves well-formedness).

$$+ T \vdash P \iff T \vdash \mathbf{nf}(P),$$

$$- T \vdash N \iff T \vdash \mathbf{nf}(N)$$

PROOF. Immediately from lemmas 26 and 39.

Corollary 15 (Normalization preserves well-formedness of substitution).

```
T_2 \vdash \sigma : T_1 \iff T_2 \vdash \mathbf{nf}(\sigma) : T_1
```

3276

3277 3278

3279

3280

3281

PROOF. Let us prove the forward direction. Suppose that $\alpha^{\pm} \in T_1$. Let us show that $T_2 \vdash [\mathbf{nf}(\sigma)]\alpha^{\pm}$. By the definition of substitution normalization, $[\mathbf{nf}(\sigma)]\alpha^{\pm} = \mathbf{nf}([\sigma]\alpha^{\pm})$. Then by corollary 14, to show $T_2 \vdash \mathbf{nf}([\sigma]\alpha^{\pm})$, it suffices to show $T_2 \vdash [\sigma]\alpha^{\pm}$, which holds by the assumption $T_2 \vdash \sigma : T_1$.

The backward direction is proved analogously.

Lemma 40 (Normalization preserves substitution signature). Suppose that σ is a substitution, T_1 and T_2 are contexts. Then $T_2 \vdash \sigma : T_1$ implies $T_2 \vdash \mathbf{nf}(\sigma) : T_1$.

PROOF. Suppose that $\alpha^{\pm} \in T_1$. Then by corollary 14, $T_2 \vdash \mathbf{nf}([\sigma]\alpha^{\pm}) = [\mathbf{nf}(\sigma)]\alpha^{\pm}$ is equivalent to $T_2 \vdash [\sigma]\alpha^{\pm}$.

Suppose that $\alpha^{\pm} \notin T_1$. $T_2 \vdash \sigma : T_1$ means that $[\sigma]\alpha^{\pm} = \alpha^{\pm}$, and then $[\mathbf{nf}(\sigma)]\alpha^{\pm} = \mathbf{nf}([\sigma]\alpha^{\pm}) = \mathbf{nf}(\alpha^{\pm}) = \alpha^{\pm}$.

Corollary 16 (Normalization is sound w.r.t. subtyping-induced equivalence).

```
+ if T \vdash P then T \vdash P \simeq^{\leqslant} nf(P),

- if T \vdash N then T \vdash N \simeq^{\leqslant} nf(N).
```

PROOF. Immediately from lemmas 27 and 39 and corollary 14.

Corollary 17 (Normalization preserves subtyping). *Assuming all the types are well-formed in context T*,

```
+ T \vdash P \geqslant Q \iff T \vdash \operatorname{nf}(P) \geqslant \operatorname{nf}(Q),
- T \vdash N \leqslant M \iff T \vdash \operatorname{nf}(N) \leqslant \operatorname{nf}(M).
```

Proof.

- + \Rightarrow Let us assume $T \vdash P \geqslant Q$. By corollary 16, $T \vdash P \simeq^{\leq} \mathbf{nf}(P)$ and $T \vdash Q \simeq^{\leq} \mathbf{nf}(Q)$, in particular, by inversion, $T \vdash \mathbf{nf}(P) \geqslant P$ and $T \vdash Q \geqslant \mathbf{nf}(Q)$. Then by transitivity of subtyping (lemma 22), $T \vdash \mathbf{nf}(P) \geqslant \mathbf{nf}(Q)$.
 - \Leftarrow Let us assume $T \vdash \mathbf{nf}(P) \ge \mathbf{nf}(Q)$. Also by corollary 16 and inversion, $T \vdash P \ge \mathbf{nf}(P)$ and $T \vdash \mathbf{nf}(Q) \ge Q$. Then by the transitivity, $T \vdash P \ge Q$.
- The negative case is proved symmetrically.

Corollary 18 (Normalization preserves ordering). *For any vars,*

- ord vars in nf (N) = ord vars in M
- + ord vars in nf (P) = ord vars in Q

PROOF. Immediately from lemmas 37 and 39.

Lemma 41 (Distributivity of normalization over substitution). *Normalization of a term distributes* over substitution. Suppose that σ is a substitution, N and P are types. Then

```
- \operatorname{nf}([\sigma]N) = [\operatorname{nf}(\sigma)]\operatorname{nf}(N) 
+ \operatorname{nf}([\sigma]P) = [\operatorname{nf}(\sigma)]\operatorname{nf}(P)
```

where $\mathbf{nf}(\sigma)$ means pointwise normalization: $[\mathbf{nf}(\sigma)]\alpha^- = \mathbf{nf}([\sigma]\alpha^-)$.

PROOF. Mutual induction on N and P.

3282 3283 П

```
Case 1. N = \alpha^{-}
3284
                           \operatorname{nf}([\sigma]N) = \operatorname{nf}([\sigma]\alpha^{-}) = [\operatorname{nf}(\sigma)]\alpha^{-}.
3285
                          [\operatorname{nf}(\sigma)]\operatorname{nf}(N) = [\operatorname{nf}(\sigma)]\operatorname{nf}(\alpha^{-}) = [\operatorname{nf}(\sigma)]\alpha^{-}.
3286
                      Case 2. P = \alpha^+
3287
                          Similar to case 1.
3288
                      Case 3. If the type is formed by \rightarrow, \uparrow, or \downarrow, the required equality follows from the congru-
                          ence of the normalization and substitution and the induction hypothesis. For example, if
3290
                          N = P \rightarrow M then
3291
                          \operatorname{nf}([\sigma]N) = \operatorname{nf}([\sigma](P \to M))
3292
3293
                                               = \mathbf{nf} ([\sigma] P \to [\sigma] M)
                                                                                                                         By congruence of substitution
                                               = \mathbf{nf}([\sigma]P) \to \mathbf{nf}([\sigma]M)
                                                                                                                         By congruence of normalization
                                               = [\mathbf{nf}(\sigma)]\mathbf{nf}(\underline{P}) \to [\mathbf{nf}(\sigma)]\mathbf{nf}(\underline{M})
                                                                                                                       By induction hypothesis
                                               = [nf(\sigma)](nf(P) \rightarrow nf(M))
                                                                                                                         By congruence of substitution
                                               = [nf(\sigma)]nf(P \rightarrow M)
                                                                                                                         By congruence of normalization
                                               = [nf(\sigma)]nf(N)
                     Case 4. N = \forall \overrightarrow{\alpha}^+. M
                          [\mathbf{nf}(\sigma)]\mathbf{nf}(N) = [\mathbf{nf}(\sigma)]\mathbf{nf}(\forall \alpha^{+}.M)
3302
3303
                                                        = [\operatorname{nf}(\sigma)] \forall \overrightarrow{\alpha^{+\prime}}. \operatorname{nf}(M) Where \overrightarrow{\alpha^{+\prime}} = \operatorname{ord} \overrightarrow{\alpha^{+}} in \operatorname{nf}(M) = \operatorname{ord} \overrightarrow{\alpha^{+}} in M
3304
                                                                                                          (the latter is by corollary 18)
3305
                          \operatorname{nf}([\sigma]N) = \operatorname{nf}([\sigma] \forall \overrightarrow{\alpha^+}. M)
3306
3307
                                              = \inf (\forall \overrightarrow{\alpha}^+, [\sigma] M)
                                                                                                Assuming \overrightarrow{\alpha^+} \cap T_1 = \emptyset and \overrightarrow{\alpha^+} \cap T_2 = \emptyset
3308
                                               = \forall \overrightarrow{\beta^+}. nf ([\sigma]M)
                                                                                                Where \overrightarrow{\beta}^{+} = \operatorname{ord} \overrightarrow{\alpha}^{+} \operatorname{in} \operatorname{nf} ([\sigma]M) = \operatorname{ord} \overrightarrow{\alpha}^{+} \operatorname{in} [\sigma]M
3309
3310
                                                                                                 (the latter is by corollary 18)
3311
                                               = \forall \overrightarrow{\alpha^{+\prime}}. nf ([\sigma]M)
3312
                                                                                               By lemma 36,
3313
                                                                                               \overrightarrow{\beta^+} = \overrightarrow{\alpha^+}' since \overrightarrow{\alpha^+} is disjoint with T_1 and T_2
3314
                                               = \forall \overrightarrow{\alpha^{+}}'. [nf (\sigma)]nf (M) By the induction hypothesis
3315
3316
                          To show the alpha-equivalence of [\mathbf{nf}(\sigma)] \forall \overrightarrow{\alpha^{+\prime}}. \mathbf{nf}(M) and \forall \overrightarrow{\alpha^{+\prime}}. [\mathbf{nf}(\sigma)]\mathbf{nf}(M), we can
3317
                          assume that \overrightarrow{\alpha}^{+\prime} \cap T_1 = \emptyset, and \overrightarrow{\alpha}^{+\prime} \cap T_2 = \emptyset.
3318
                      Case 5. P = \exists \overrightarrow{\alpha}. O
3319
                          Same as for case 4.
3320
3321
3322
            Corollary 19 (Commutativity of normalization and renaming). Normalization of a term commutes
3323
```

with renaming. Suppose that μ is a bijection between two sets of variables $\mu:A\leftrightarrow B$. Then

$$- \mathbf{nf} ([\mu]N) = [\mu]\mathbf{nf} (N)$$

+ \mathbf{nf} ([\mu]\bar{P}) = [\mu]\mathbf{nf} (\bar{P})

PROOF. Immediately from lemma 41, after noticing that **nf** (μ) = μ .

Lemma 42 (Completeness of Normalization w.r.t. Declarative Equivalence). Normalization returns the same representative for equivalent types.

- If $N \simeq^D M$ then $\mathbf{nf}(N) = \mathbf{nf}(M)$,

+ if P \simeq^D Q then nf (P) = nf (O).
3333
3334
                  PROOF. Mutual induction on N \simeq^D M and P \simeq^D Q.
3335
                      Case 1. (\forall^{\simeq^D})
3336
3337
                            From the definition of the normalization,

• \mathbf{nf} (\forall \alpha^{+}. N) = \forall \alpha^{+}'. \mathbf{nf} (N) where \alpha^{+}' is \mathbf{ord} \alpha^{+} \mathbf{in} \mathbf{nf} (N)
3338
                                • \operatorname{nf}(\forall \overrightarrow{\beta^+}, M) = \forall \overrightarrow{\beta^{+\prime}}. \operatorname{nf}(M) where \overrightarrow{\beta^{+\prime}} is \operatorname{ord} \overrightarrow{\beta^{+}} in \operatorname{nf}(M)
3340
                            Let us take \mu: (\overrightarrow{\beta^+} \cap \mathbf{fv} M) \leftrightarrow (\overrightarrow{\alpha^+} \cap \mathbf{fv} N) from the inversion of the equivalence judgment
                            Notice that from lemmas 33 and 38, the domain and the codomain of \mu can be written as
3342
                            \mu: \overrightarrow{\beta^{+}}' \leftrightarrow \overrightarrow{\alpha^{+}}'
                           To show the alpha-equivalence of \forall \alpha^{+\prime}. nf (N) and \forall \beta^{+\prime}. nf (M), it suffices to prove that
3344
                            (i) [\mu]nf (M) = nf (N) and
                            (ii) [\mu] \overrightarrow{\beta}^{+\prime} = \overrightarrow{\alpha}^{+\prime}.
                              (i) [\mu]nf (M) =nf ([\mu]M) =nf (N). The first equality holds by corollary 19, the second—
                                     by the induction hypothesis.
                             (ii) [\mu] \overrightarrow{\beta}^{+\prime} = [\mu] \text{ ord } \overrightarrow{\beta}^{+} \text{ in nf } (M)
                                                                                                                               by the definition of \overrightarrow{\beta}^+
3350
                                                    = [\mu] \operatorname{ord} (\overrightarrow{\beta^+} \cap \operatorname{fv} M) \operatorname{in} \operatorname{nf} (M)
                                                                                                                               from lemmas 34 and 38
                                                    = ord [\mu](\overrightarrow{\beta}^+ \cap \text{fv } M) in [\mu]nf (M) by lemma 35, because
                                                                                                                                \overrightarrow{\alpha^+} \cap \text{fy } N \cap \text{fy nf } (M) \subseteq \overrightarrow{\alpha^+} \cap \text{fy } M = \emptyset
                                                                                                                                \overrightarrow{\alpha^+} \cap \text{fv } N \cap (\overrightarrow{\beta^+} \cap \text{fv } M) \subseteq \overrightarrow{\alpha^+} \cap \text{fv } M = \emptyset
                                                    = ord [\mu](\overrightarrow{\beta}^+ \cap \text{fv } M) in nf (N)
                                                                                                                                since [\mu]nf (M) = nf (N) is proved
                                                    = ord (\overrightarrow{\alpha}^+ \cap \text{fv } N) in nf (N)
                                                                                                                                because \mu is a bijection between
3360
                                                                                                                               \overrightarrow{\alpha}^+ \cap \text{fv } N \text{ and } \overrightarrow{\beta}^+ \cap \text{fv } M
                                                    = \operatorname{ord} \overrightarrow{\alpha^+} \operatorname{innf}(N)
                                                                                                                                from lemmas 34 and 38
```

 $-\overrightarrow{\alpha^{+}}$ **Case 2**. (\exists^{\simeq^D}) Same as for case 1.

Case 3. Other rules are congruent, and thus, proved by the corresponding congruent alphaequivalence rule, which is applicable by the induction hypothesis.

by the definition of $\overrightarrow{\alpha}^{+\prime}$

Lemma 43 (Algorithmization of Declarative Equivalence). Declarative equivalence is the equality of normal forms.

```
+ P \simeq^D O \iff \mathbf{nf}(P) = \mathbf{nf}(O),
-N \simeq^D M \iff \mathbf{nf}(N) = \mathbf{nf}(M).
```

Proof.

- + Let us prove both directions separately.
 - \Rightarrow exactly by lemma 42,
 - \Leftarrow from lemma 39, we know $P \simeq^D \mathbf{nf}(P) = \mathbf{nf}(Q) \simeq^D Q$, then by transitivity (lemma 25). $P \simeq^D O$.
- For the negative case, the proof is the same.

Corollary 20 (Completeness of Normalization w.r.t. Subtyping-Induced Equivalence). Assuming all the types below are well-formed in T:

```
+ if T \vdash P \cong^{\leq} Q \text{ then } \mathbf{nf}(P) = \mathbf{nf}(Q),

- if T \vdash N \cong^{\leq} M \text{ then } \mathbf{nf}(N) = \mathbf{nf}(M).
```

PROOF. Immediately from lemmas 32 and 42.

Lemma 44 (Idempotence of normalization). Normalization is idempotent

$$-\inf\left(\inf\left(N\right)\right) = \inf\left(N\right)$$

+
$$\mathbf{nf}(\mathbf{nf}(P)) = \mathbf{nf}(P)$$

PROOF. By applying lemma 42 to lemma 39.

Lemma 45. The result of a substitution is normalized if and only if the initial type and the substitution are normalized.

Suppose that σ is a substitution $T_2 \vdash \sigma : T_1$, P is a positive type $(T_1 \vdash P)$, N is a negative type

$$+ \ [\sigma] P \text{ is normal} \iff \begin{cases} \sigma|_{\mathbf{fv}\,(P)} & \text{is normal} \\ P & \text{is normal} \end{cases}$$

$$- \ [\sigma] N \text{ is normal} \iff \begin{cases} \sigma|_{\mathbf{fv}\,(N)} & \text{is normal} \\ N & \text{is normal} \end{cases}$$

PROOF. Mutual induction on $T_1 \vdash P$ and $T_1 \vdash N$.

Case 1. $N = \alpha^-$

Then N is always normal, and the normality of $\sigma|_{\alpha^-}$ by the definition means $[\sigma]_{\alpha^-}$ is normal.

Case 2. $N = P \rightarrow M$

$$[\sigma](P \to M) \text{ is normal} \iff [\sigma]P \to [\sigma]M \text{ is normal} \qquad \text{by substitution congruence}$$

$$\iff \begin{cases} [\sigma]P & \text{is normal} \\ [\sigma]M & \text{is normal} \end{cases}$$

$$\iff \begin{cases} P & \text{is normal} \\ \sigma|_{\text{fv}(P)} & \text{is normal} \\ M & \text{is normal} \end{cases}$$
 by the induction hypothesis
$$\Leftrightarrow \begin{cases} P \to M & \text{is normal} \\ \sigma|_{\text{fv}(P) \cup \text{fv}(M)} & \text{is normal} \end{cases}$$

$$\iff \begin{cases} P \to M & \text{is normal} \\ \sigma|_{\text{fv}(P) \cup \text{fv}(M)} & \text{is normal} \end{cases}$$

$$\iff \begin{cases} P \to M & \text{is normal} \\ \sigma|_{\text{fv}(P \to M)} & \text{is normal} \end{cases}$$

$$\iff \begin{cases} P \to M & \text{is normal} \\ \sigma|_{\text{fv}(P \to M)} & \text{is normal} \end{cases}$$

Case 3. $N = \uparrow P$

By congruence and the inductive hypothesis, similar to case 2

```
Case 4. N = \forall \alpha^{-1}. M

[\sigma] (\forall \alpha^{-1}. M) is normal

\iff (\forall \alpha^{-1}, [\sigma]M) is normal

\iff \{ [\sigma]M \text{ is normal} \}

by the definition of normalization

\iff \{ [\sigma]M \text{ is normal} \}

by lemma 36

\iff \{ [\sigma]_{\text{fv}}(M) \text{ is normal} \}

\iff \{ [\sigma]_{\text{fv}}
```

Lemma 46 (Algorithmization of subtyping-induced equivalence). *Mutual subtyping is the equality of normal forms. Assuming all the types below are well-formed in T:*

```
+ T \vdash P \simeq^{\leq} Q \iff \text{nf}(P) = \text{nf}(Q),
- T \vdash N \simeq^{\leq} M \iff \text{nf}(N) = \text{nf}(M).
```

PROOF. Let us prove the positive case, the negative case is symmetric. We prove both directions of \iff separately:

 \Rightarrow exactly corollary 20;

 \Leftarrow by lemmas 27 and 43.

Corollary 21 (Substitution preserves declarative equivalence). Suppose that σ is a substitution. Then

+
$$P \simeq^D Q$$
 implies $[\sigma]P \simeq^D [\sigma]Q$
- $N \simeq^D M$ implies $[\sigma]N \simeq^D [\sigma]M$

PROOF.
$$P \simeq^D Q \Rightarrow \mathbf{nf}(P) = \mathbf{nf}(Q)$$
 by lemma 46

$$\Rightarrow [\mathbf{nf}(\sigma)]\mathbf{nf}(P) = [\mathbf{nf}(\sigma)]\mathbf{nf}(Q)$$

$$\Rightarrow \mathbf{nf}([\sigma]P) = \mathbf{nf}([\sigma]Q)$$
 by lemma 41

$$\Rightarrow [\sigma]P \simeq^D [\sigma]Q$$
 by lemma 46

9 PROPERTIES OF THE ALGORITHMIC TYPE SYSTEM

9.1 Algorithmic Type Well-formedness

Lemma 50 (Soundness of algorithmic type well-formedness).

+ if T; $\Upsilon \vdash P$ then $\mathbf{fv}(P) \subseteq T$ and $\mathbf{uv}(P) \subseteq \Upsilon$; - if T; $\Upsilon \vdash N$ then $\mathbf{fv}(N) \subseteq T$ and $\mathbf{uv}(N) \subseteq \Upsilon$.

Vol. 1. No. 1, Article , Publication date: November 2023.

PROOF. The proof is analogous to lemma 1. The additional base case is when $T : \Upsilon \vdash P$ is derived by (UVAR₊^{WF}), and the symmetric negative case. In this case, $P = \widehat{\alpha}^+$, and $\mathbf{uv}(P) = \widehat{\alpha}^+ \subseteq \Upsilon$ by inversion; $\mathbf{fv}(P) = \emptyset \subseteq T$ vacuously.

Lemma 51 (Completeness of algorithmic type well-formedness). *In the well-formedness judgment, only used variables matter:*

```
+ if T_1 \cap \mathbf{fv} P = T_2 \cap \mathbf{fv} P and \Upsilon_1 \cap \mathbf{uv} P = \Upsilon_2 \cap \mathbf{uv} P then T_1 ; \Upsilon_1 \vdash P \iff T_2 ; \Upsilon_2 \vdash P, and - if T_1 \cap \mathbf{fv} N = T_2 \cap \mathbf{fv} N and \Upsilon_1 \cap \mathbf{uv} N = \Upsilon_2 \cap \mathbf{uv} N then T_1 ; \Upsilon_1 \vdash N \iff T_2 ; \Upsilon_2 \vdash N.
```

PROOF. By mutual structural induction on P and N.

Lemma 52 (Variable algorithmization agrees with well-formedness).

```
+ T, \overrightarrow{\alpha} + P implies T; \overrightarrow{\widehat{\alpha}} + [\overrightarrow{\widehat{\alpha}}/\overrightarrow{\alpha}]P;

- T, \overrightarrow{\alpha} + N implies T; \overrightarrow{\widehat{\alpha}} + [\overrightarrow{\widehat{\alpha}}/\overrightarrow{\alpha}]N.
```

PROOF. The proof is a structural induction on T, $\overrightarrow{\alpha} \vdash P$ and mutually, on T, $\overrightarrow{\alpha} \vdash N$. Notice that the substitutions commute with all the constructors, providing the step of the induction.

Lemma 53 (Variable de-algorithmization agrees with well-formedness).

```
+ T; \overrightarrow{\alpha} + P implies T, \overrightarrow{\alpha} + [\overrightarrow{\alpha}^2/\overrightarrow{\alpha}]P;

- T; \overrightarrow{\alpha} + N implies T, \overrightarrow{\alpha} + [\overrightarrow{\alpha}^2/\overrightarrow{\alpha}]N.
```

PROOF. As for lemma 52, the proof is a structural induction on T; $\overrightarrow{\alpha} \vdash P$ and mutually, on T; $\overrightarrow{\alpha} \vdash N$.

Corollary 22 (Well-formedness Algorithmic Context Weakening). *Suppose that* $T_1 \subseteq T_2$, *and* $\Upsilon_1 \subseteq \Upsilon_2$. *Then*

```
+ if T_1 ; \Upsilon_1 \vdash P implies T_2 ; \Upsilon_2 \vdash P,

- if T_1 ; \Upsilon_1 \vdash N implies T_2 ; \Upsilon_2 \vdash N.
```

PROOF. By lemma 50, T_1 ; $\Upsilon_1 \vdash P$ implies $\mathbf{fv}(P) \subseteq T_1 \subseteq T_2$ and $\mathbf{uv}(P) \subseteq \Upsilon_1 \subseteq \Upsilon_2$, and thus $\mathbf{fv}(P) = \mathbf{fv}(P) \cap T_1 = \mathbf{fv}(P) \cap T_2$, and $\mathbf{uv}(P) = \mathbf{uv}(P) \cap \Upsilon_1 = \mathbf{uv}(P) \cap \Upsilon_2$. Then by lemma 51 T_2 ; $\Upsilon_2 \vdash P$. The negative case is symmetric.

9.2 Substitution

Lemma 55 (Algorithmic Substitution Strengthening). Restricting the substitution to the algorithmic variables of the substitution subject does not affect the result. Suppose that $\hat{\sigma}$ is an algorithmic substitution, \underline{P} and \underline{N} are algorithmic types. Then

```
+ [\widehat{\sigma}]_{P}^{P} = [\widehat{\sigma}|_{\mathbf{uv}_{P}}]_{P}^{P},

- [\widehat{\sigma}]_{N}^{N} = [\widehat{\sigma}|_{\mathbf{uv}_{N}}]_{N}^{N}
```

PROOF. The proof is analogous to the proof of lemma 4.

Lemma 56 (Substitutions equal on the algorithmic variables). Suppose that $\widehat{\sigma}_1$ and $\widehat{\sigma}_2$ are normalized substitutions of signature $\Sigma \vdash \widehat{\sigma}_i : \Upsilon$. Then

```
+ for a normalized type T ; \Upsilon \vdash P, if [\widehat{\sigma}_1]P = [\widehat{\sigma}_2]P then \widehat{\sigma}_1|_{(\mathbf{uv}P)} = \widehat{\sigma}_2|_{(\mathbf{uv}P)};

- for a normalized type T ; \Upsilon \vdash N, if [\widehat{\sigma}_1]N = [\widehat{\sigma}_2]N then \widehat{\sigma}_1|_{(\mathbf{uv}N)} = \widehat{\sigma}_2|_{(\mathbf{uv}N)}.
```

PROOF. The proof is a simple structural induction on T; $\Upsilon \vdash P$ and mutually, on T; $\Upsilon \vdash N$. Let us consider the shape of N (the cases of P are symmetric).

Case 1. $T: \Upsilon \vdash \widehat{\alpha}^-$. Then $[\widehat{\sigma}_1]\widehat{\alpha}^- = [\widehat{\sigma}_2]\widehat{\alpha}^-$ implies $\widehat{\sigma}_1|_{(\mathbf{uv}\widehat{\alpha}^-)} = \widehat{\sigma}_2|_{(\mathbf{uv}\widehat{\alpha}^-)}$ immediately.

Case 2. $T : \Upsilon \vdash \alpha^-$. Then $\mathbf{uv} \widehat{\alpha}^- = \emptyset$, and $\widehat{\sigma}_1|_{(\mathbf{uv}\widehat{\alpha}^-)} = \widehat{\sigma}_2|_{(\mathbf{uv}\widehat{\alpha}^-)}$ holds vacuously.

Case 3. $T : \Upsilon \vdash \forall \alpha^+$. N. Then we are proving that $[\widehat{\sigma}_1] \forall \alpha^+$. $N = [\widehat{\sigma}_2] \forall \alpha^+$. N implies $\widehat{\sigma}_1|_{(\mathbf{uv}\forall \alpha^{\overline{d}^+}, N)} = \widehat{\sigma}_2|_{(\mathbf{uv}\forall \alpha^{\overline{d}^+}, N)}$. By definition of substitution and (\forall^{\simeq}) , $[\widehat{\sigma}_1] N = [\widehat{\sigma}_2] N$ implies $\widehat{\sigma}_1|_{\mathbf{uv}N} = \widehat{\sigma}_2|_{\mathbf{uv}N}$. Since $\forall \alpha^+$. N is normalized, so is T, α^+ ; $\Upsilon \vdash N$, hence, the induction hypothesis is applicable and implies $\widehat{\sigma}_1|_{\mathbf{uv}N} = \widehat{\sigma}_2|_{\mathbf{uv}N}$, as required.

Case 4. $T : \Upsilon \vdash P \to N$. Then we are proving that $[\widehat{\sigma}_1](P \to N) = [\widehat{\sigma}_2](P \to N)$

Case 4. $T: \Upsilon \vdash P \to N$. Then we are proving that $[\widehat{\sigma}_1](P \to N) = [\widehat{\sigma}_2](P \to N)$ implies $\widehat{\sigma}_1|_{(\mathbf{uv}P\to N)} = \widehat{\sigma}_2|_{(\mathbf{uv}P\to N)}$. By definition of substitution and congruence of equality, $[\widehat{\sigma}_1](P \to N) = [\widehat{\sigma}_2](P \to N)$ means $[\widehat{\sigma}_1]P = [\widehat{\sigma}_2]P$ and $[\widehat{\sigma}_1]N = [\widehat{\sigma}_2]N$. Notice that P and N are normalized since $P \to N$ is normalized, and well-formed in the same contexts. This way, by the induction hypothesis, $\widehat{\sigma}_1|_{(\mathbf{uv}P)} = \widehat{\sigma}_2|_{(\mathbf{uv}P)}$ and $\widehat{\sigma}_1|_{(\mathbf{uv}N)} = \widehat{\sigma}_2|_{(\mathbf{uv}N)}$, which since $\mathbf{uv}(P \to N) = \mathbf{uv}P \cup \mathbf{uv}N$ implies $\widehat{\sigma}_1|_{(\mathbf{uv}P\to N)} = \widehat{\sigma}_2|_{(\mathbf{uv}P\to N)}$.

Case 5. $T : \Upsilon \vdash \uparrow P$. The proof is similar to the previous case: we apply congruence of substitution, equality, and normalization, then the induction hypothesis, and then the fact that $\mathbf{uv} (\uparrow P) = \mathbf{uv} P$.

Corollary 23 (Substitutions equivalent on the algorithmic variables). Suppose that $\widehat{\sigma}_1$ and $\widehat{\sigma}_2$ are substitutions of signature $\Sigma \vdash \widehat{\sigma}_i : \Upsilon$ where $T \vdash^{\supseteq} \Sigma$. Then

```
+ for a type T; \Upsilon \vdash \mathbf{P}, if T \vdash [\widehat{\sigma}_1] \mathbf{P} \simeq^{\leqslant} [\widehat{\sigma}_2] \mathbf{P} then \Sigma \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : \mathbf{uv} \mathbf{P};
```

- for a type T; $\Upsilon \vdash N$, if $T \vdash [\widehat{\sigma}_1] N \simeq^{\leq} [\widehat{\sigma}_2] N$ then $\Sigma \vdash \widehat{\sigma}_1 \simeq^{\leq} \widehat{\sigma}_2 : \mathbf{uv} N$.

PROOF. First, let us normalize the types and the substitutions, and show that the given equivalences and well-formedness properties are preserved. $T : \Upsilon \vdash P$ implies $T : \Upsilon \vdash \mathbf{nf}(P)$ by corollary 24. $\Sigma \vdash [\widehat{\sigma}_1]P \simeq^D [\widehat{\sigma}_2]P$ implies $\mathbf{nf}([\widehat{\sigma}_1]P) = \mathbf{nf}([\widehat{\sigma}_2]P)$ by lemma 46. Then $\mathbf{nf}([\widehat{\sigma}_1]P) = \mathbf{nf}([\widehat{\sigma}_2]P)$ implies $[\mathbf{nf}(\widehat{\sigma}_1)]\mathbf{nf}(P) = [\mathbf{nf}(\widehat{\sigma}_2)]\mathbf{nf}(P)$ by lemma 41. Notice that by corollary 25 $\Sigma \vdash \widehat{\sigma}_i : \Upsilon$ implies $\Sigma \vdash \mathbf{nf}(\widehat{\sigma}_i) : \Upsilon$.

This way, by lemma 56, $\Sigma \vdash [\widehat{\sigma}_1] \stackrel{P}{P} \simeq^D [\widehat{\sigma}_2] \stackrel{P}{P}$ implies $\mathbf{nf}(\widehat{\sigma}_1)|_{(\mathbf{uv}\,\mathbf{nf}(P))} = \mathbf{nf}(\widehat{\sigma}_2)|_{(\mathbf{uv}\,\mathbf{nf}(P))}$. Then by lemma 58, $\mathbf{nf}(\widehat{\sigma}_1)|_{(\mathbf{uv}\,P)} = \mathbf{nf}(\widehat{\sigma}_2)|_{(\mathbf{uv}\,P)}$, and by corollary 26, $\Sigma \vdash \widehat{\sigma}_1 \simeq^{\varsigma} \widehat{\sigma}_2 : \mathbf{uv} \stackrel{P}{P}$. Symmetrically, $\Sigma \vdash [\widehat{\sigma}_1] \stackrel{N}{N} \simeq^D [\widehat{\sigma}_2] \stackrel{N}{N}$ implies $\Sigma \vdash \widehat{\sigma}_1 \simeq^{\varsigma} \widehat{\sigma}_2 : \mathbf{uv} \stackrel{N}{N}$.

9.3 Normalization

Lemma 58 (Algorithmic variables are not changed by the normalization).

```
- uv \underline{N} \equiv uv nf (\underline{N})
+ uv \underline{P} \equiv uv nf (\underline{P})
```

PROOF. By straightforward induction on N and mutually on P, similar to the proof of lemma 38

Lemma 59 (Soundness of normalization of algorithmic types).

```
- N \simeq^D \mathbf{nf}(N)
+ P \simeq^D \mathbf{nf}(P)
```

PROOF. The proof coincides with the proof of lemma 39.

9.4 Equivalence

Lemma 60 (Algorithmic type well-formedness is invariant under equivalence). *Mutual subtyping implies declarative equivalence.*

+ if
$$P \simeq^D Q$$
 then $T : \Upsilon \vdash P \iff T : \Upsilon \vdash Q$

 $- if N \simeq^D M then T; \Upsilon \vdash N \iff T; \Upsilon \vdash M$

PROOF. The proof coincides with the proof of lemma 26, and adds two cases for equating two positive or two negative algorithmic variables, which must be equal by inversion, and thus, $T: \Upsilon \vdash \widehat{\alpha}^{\pm} \iff T: \Upsilon \vdash \widehat{\alpha}^{\pm}$ holds trivially.

Corollary 24 (Normalization preserves well-formedness of algorithmic types).

```
+ T : \Upsilon \vdash P \iff T : \Upsilon \vdash \mathbf{nf}(P),

- T : \Upsilon \vdash N \iff T : \Upsilon \vdash \mathbf{nf}(N)
```

PROOF. Immediately from lemmas 59 and 60.

Corollary 25 (Normalization preserves the signature of the algorithmic substitution). $\Sigma \vdash \widehat{\sigma} : \Upsilon \iff \Sigma \vdash \mathbf{nf}(\widehat{\sigma}) : \Upsilon, T \vdash \widehat{\sigma} : \Upsilon \iff T \vdash \mathbf{nf}(\widehat{\sigma}) : \Upsilon.$

PROOF. The proof is analogous to corollary 15.

Corollary 26 (Algorithmic substitution equivalence becomes equality after normalization). Suppose that $\Sigma \vdash \widehat{\sigma}_1 : \Upsilon'$ and $\Sigma \vdash \widehat{\sigma}_2 : \Upsilon'$ are algorithmic substitutions and $\Upsilon \subseteq \Upsilon'$. Then $\Sigma \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : \Upsilon \iff \mathbf{nf}(\widehat{\sigma}_1)|_{\Upsilon} = \mathbf{nf}(\widehat{\sigma}_2)|_{\Upsilon}$.

PROOF. Follows immediately from lemma 46:

- $\Rightarrow \text{ If } \widehat{\alpha}^{\pm} \notin \Upsilon, \text{ then } [\mathbf{nf}(\widehat{\sigma}_1)|_{\Upsilon}]\widehat{\alpha}^{\pm} = [\mathbf{nf}(\widehat{\sigma}_2)|_{\Upsilon}]\widehat{\alpha}^{\pm} = \widehat{\alpha}^{\pm} \text{ by definition. For any } \widehat{\alpha}^{\pm} \in \Upsilon, \\ [\mathbf{nf}(\widehat{\sigma}_1)|_{\Upsilon}]\widehat{\alpha}^{\pm} = \mathbf{nf}([\widehat{\sigma}_1]\widehat{\alpha}^{\pm}) \text{ and } [\mathbf{nf}(\widehat{\sigma}_2)|_{\Upsilon}]\widehat{\alpha}^{\pm} = \mathbf{nf}([\widehat{\sigma}_2]\widehat{\alpha}^{\pm}); \Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}_1]\widehat{\alpha}^{\pm} \simeq^{\leqslant} [\widehat{\sigma}_2]\widehat{\alpha}^{\pm} \\ \text{implies } \mathbf{nf}([\widehat{\sigma}_1]\widehat{\alpha}^{\pm}) = \mathbf{nf}([\widehat{\sigma}_2]\widehat{\alpha}^{\pm}) \text{ by lemma 43.}$
- \Leftarrow If $\widehat{\alpha}^{\pm} \in \Upsilon$, then $\mathbf{nf}(\widehat{\sigma}_1)|_{\Upsilon} = \mathbf{nf}(\widehat{\sigma}_2)|_{\Upsilon}$ implies $\mathbf{nf}([\widehat{\sigma}_1]\widehat{\alpha}^{\pm}) = \mathbf{nf}([\widehat{\sigma}_2]\widehat{\alpha}^{\pm})$ by definition of substitution restriction and normalization. In turn, $\mathbf{nf}([\widehat{\sigma}_1]\widehat{\alpha}^{\pm}) = \mathbf{nf}([\widehat{\sigma}_2]\widehat{\alpha}^{\pm})$ means $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}_1]\widehat{\alpha}^{\pm} \simeq^{\varsigma} [\widehat{\sigma}_2]\widehat{\alpha}^{\pm}$ by lemma 43.

9.5 Unification Constraint Merge

Observation 3 (Unification Constraint Merge Determinism). Suppose that $\Sigma \vdash UC_1$ and $\Sigma \vdash UC_2$ If $\Sigma \vdash UC_1 \& UC_2 = UC$ and $\Sigma \vdash UC_1 \& UC_2 = UC'$ are defined then UC = UC'.

PROOF. UC and UC' both consists of three parts: Entries of UC_1 that do not have matching entries in UC_2 , entries of UC_2 that do not have matching entries in UC_1 , and the merge of matching entries.

The parts corresponding to unmatched entries of UC_1 and UC_2 coincide, since UC_1 and UC_2 are fixed. To show that the merge of matching entries coincide, let us take any pair of matching $ue_1 \in UC_1$ and $ue_2 \in UC_2$ and consider their shape.

Case 1. ue_1 is $\widehat{\alpha}^+$: $\simeq Q_1$ and ue_2 is $\widehat{\alpha}^+$: $\simeq Q_2$ then the result, if it exists, is always ue_1 , by inversion of $(\simeq \&^+ \simeq)$.

Case 2. ue_1 is $\widehat{\alpha}^- := N_1$ and ue_2 is $\widehat{\alpha}^- := N_2$ then analogously, the result, if it exists, is always ue_1 , by inversion of $(\cong \&^- \cong)$.

This way, the third group of entries coincide as well.

Lemma 61 (Soundness of Unification Constraint Merge). Suppose that $\Sigma \vdash UC_1$ and $\Sigma \vdash UC_2$ are normalized unification constraints. If $\Sigma \vdash UC_1 \otimes UC_2 = UC$ is defined then $UC = UC_1 \cup UC_2$.

Proof.

 • $UC_1 \& UC_2 \subseteq UC_1 \cup UC_2$

By definition, UC_1 & UC_2 consists of three parts: entries of UC_1 that do not have matching entries of UC_2 , entries of UC_2 that do not have matching entries of UC_1 , and the merge of matching entries.

If ue is from the first or the second part, then $ue \in UC_1 \cup UC_2$ holds immediately. If ue is from the third part, then ue is the merge of two matching entries $ue_1 \in UC_1$ and $ue_2 \in UC_2$. Since UC_1 and UC_2 are normalized unification, ue_1 and ue_2 have one of the following forms:

- $-\widehat{\alpha}^+:\simeq P_1$ and $\widehat{\alpha}^+:\simeq P_2$, where P_1 and P_2 are normalized, and then since $\Sigma(\widehat{\alpha}^+) \vdash ue_1 \& ue_2 = ue$ exists, $(\simeq \&^+ \simeq)$ was applied to infer it. It means that $ue = ue_1 = ue_2$;
- $-\widehat{\alpha}^-:\simeq N_1$ and $\widehat{\alpha}^-:\simeq N_2$, then symmetrically, $\Sigma(\widehat{\alpha}^-)\vdash ue_1$ & $ue_2=ue=ue_1=ue_2$ In both cases, $ue\in UC_1\cup UC_2$.
- $UC_1 \cup UC_2 \subseteq UC_1 \& UC_2$

Let us take an arbitrary $ue_1 \in UC_1$. Then since UC_1 is a unification constraint, ue_1 has one of the following forms:

- $\widehat{\alpha}^+$:≃ P where P is normalized. If $\widehat{\alpha}^+$ ∉ dom (UC_2), then $ue_1 \in UC_1$ & UC_2 . Otherwise, there is a normalized matching $ue_2 = (\widehat{\alpha}^+ : ≃ P') \in UC_2$ and then since UC_1 & UC_2 exists (≃ &+ ≃) was applied to construct ue_1 & $ue_2 \in UC_1$ & UC_2 . By inversion of (≃ &+ ≃), ue_1 & $ue_2 = ue_1$, and nf(P) = nf(P'), which since P and P' are normalized, implies that P = P', that is $ue_1 = ue_2 \in UC_1$ & UC_2 .
- $-\widehat{\alpha}^-$:≃ N where N is normalized. Then symmetrically, $ue_1 = ue_2 \in UC_1 \& UC_2$. Similarly, if we take an arbitrary $ue_2 \in UC_2$, then $ue_1 = ue_2 \in UC_1 \& UC_2$.

Corollary 27. Suppose that $\Sigma \vdash UC_1$ and $\Sigma \vdash UC_2$ are normalized unification constraints. If $\Sigma \vdash UC_1 \& UC_2 = UC$ is defined then

- (1) $\Sigma \vdash UC$ is normalized unification constraint,
- (2) for any substitution $\Sigma \vdash \widehat{\sigma} : \mathbf{dom}(UC), \Sigma \vdash \widehat{\sigma} : UC \text{ implies } \Sigma \vdash \widehat{\sigma} : UC_1 \text{ and } \Sigma \vdash \widehat{\sigma} : UC_2.$

PROOF. It is clear that since $UC = UC_1 \cup UC_2$ (by lemma 61), and being normalized means that all entries are normalized, UC is a normalized unification constraint. Analogously, $\Sigma \vdash UC = UC_1 \cup UC_2$ holds immediately, since $\Sigma \vdash UC_1$ and $\Sigma \vdash UC_2$.

Let us take an arbitrary substitution $\Sigma \vdash \widehat{\sigma} : \mathbf{dom}(UC)$ and assume that $\Sigma \vdash \widehat{\sigma} : UC$. Then $\Sigma \vdash \widehat{\sigma} : UC_i$ holds by definition: If $ue \in UC_i \subseteq UC_1 \cup UC_2 = UC$ then $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : ue$ (where ue restricts $\widehat{\alpha}^{\pm}$) holds since $\Sigma \vdash \widehat{\sigma} : \mathbf{dom}(UC)$.

Lemma 62 (Completeness of Unification Constraint Entry Merge). For a fixed context T, suppose that $T \vdash ue_1$ and $T \vdash ue_2$ are matching constraint entries.

+ for a type P such that $T \vdash P$: ue_1 and $T \vdash P$: ue_2 , $T \vdash ue_1 \& ue_2 = ue$ is defined and $T \vdash P$: ue_1 for a type N such that $T \vdash N$: ue_1 and $T \vdash N$: ue_2 , $T \vdash ue_1 \& ue_2 = ue$ is defined and $T \vdash N$: ue.

PROOF. Let us consider the shape of ue_1 and ue_2 .

- Case 1. ue_1 is $\widehat{\alpha}^+$: $\simeq Q_1$ and ue_2 is $\widehat{\alpha}^+$: $\simeq Q_2$. Then $T \vdash P : ue_1$ means $T \vdash P \simeq^{\leqslant} Q_1$, and $T \vdash P : ue_2$ means $T \vdash P \simeq^{\leqslant} Q_2$. Then by transitivity of equivalence (corollary 10), $T \vdash Q_1 \simeq^{\leqslant} Q_2$, which means $\mathbf{nf}(Q_1) = \mathbf{nf}(Q_2)$ by lemma 46. Hence, $(\simeq \&^+ \simeq)$ applies to infer $T \vdash ue_1 \& ue_2 = ue_2$, and $T \vdash P : ue_2$ holds by assumption.
- **Case 2**. ue_1 is $\widehat{\alpha}^- := N_1$ and ue_2 is $\widehat{\alpha}^- := M_2$. The proof is symmetric.

П

Lemma 63 (Completeness of Unification Constraint Merge). Suppose that $\Sigma \vdash UC_1$ and $\Sigma \vdash UC_2$. Then for any $\Upsilon \supseteq \mathbf{dom}(UC_1) \cup \mathbf{dom}(UC_2)$ and substitution $\Sigma \vdash \widehat{\sigma} : \Upsilon$ such that $\Sigma \vdash \widehat{\sigma} : UC_1$ and $\Sigma \vdash \widehat{\sigma} : UC_2$,

- (1) $\Sigma \vdash UC_1 \& UC_2 = UC$ is defined and
- (2) $\Sigma \vdash \widehat{\sigma} : UC$.

PROOF. The proof repeats the proof of lemma 83 for cases uses lemma 62 instead of lemma 82.

9.6 Unification

Observation 4 (Unification Determinism).

- + If $T; \Sigma \models P \stackrel{u}{\simeq} Q = UC$ and $T; \Sigma \models P \stackrel{u}{\simeq} Q = UC'$ then UC = UC'.
- If $T; \Sigma \models \mathbb{N} \stackrel{u}{\simeq} M = UC$ and $T; \Sigma \models \mathbb{N} \stackrel{u}{\simeq} M = UC'$ then UC = UC'.

PROOF. We prove it by mutual structural induction on $T; \Sigma \models \mathbb{P} \stackrel{u}{\simeq} Q \rightrightarrows UC$ and $T; \Sigma \models \mathbb{N} \stackrel{u}{\simeq} M \rightrightarrows UC'$. Let us consider the positive case only since the negative case is symmetric.

First, notice that the rule applied the last is uniquely determined by the shape of P and Q. Second, the premises of each rule are deterministic on the input either by the induction hypothesis or by observation 3.

Lemma 64 (Soundness of Unification).

- + For normalized P and Q such that T; $\operatorname{dom}(\Sigma) \vdash P$ and $T \vdash Q$, if T; $\Sigma \models P \stackrel{u}{\simeq} Q = UC$ then $\Sigma \vdash UC : \operatorname{uv} P$ and for any normalized $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : UC$, $[\widehat{\sigma}]P = Q$.
- For normalized N and M such that T; $\operatorname{dom}(\Sigma) \vdash N$ and $T \vdash M$, if T; $\Sigma \models N \stackrel{u}{\simeq} M \dashv UC$ then $\Sigma \vdash UC$: $\operatorname{uv}(N)$ and for any normalized $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : UC$, $[\widehat{\sigma}](N) = M$.

PROOF. We prove by induction on the derivation of $T; \Sigma \models \mathbb{N} \stackrel{u}{\simeq} M \rightrightarrows UC$ and mutually $T; \Sigma \models \mathbb{P} \stackrel{u}{\simeq} Q \rightrightarrows UC$. Let us consider the last rule forming this derivation.

- **Case 1**. (VAR $\stackrel{u}{\sim}$), then $N = \alpha^- = M$. The resulting unification constraint is empty: $UC = \cdot$. It satisfies $\Sigma \vdash UC : \cdot$ vacuously, and $[\widehat{\sigma}] \alpha^- = \alpha^-$, that is $[\widehat{\sigma}] N = M$.
- Case 2. $(\uparrow^{\stackrel{u}{\simeq}})$, then $N = \uparrow P$ and $M = \uparrow Q$. The algorithm makes a recursive call to $T; \Sigma \models P \stackrel{u}{\simeq} Q = UC$ returning UC. By induction hypothesis, $\Sigma \vdash UC : \mathbf{uv} P$ and thus, $\Sigma \vdash UC : \mathbf{uv} \uparrow P$ and for any $\Sigma \vdash \widehat{\sigma} : UC$, $[\widehat{\sigma}] N = [\widehat{\sigma}] \uparrow P = \uparrow Q = M$, as required.
- Case 3. $(\rightarrow^{\stackrel{u}{\simeq}})$, then $N = P \to N'$ and $M = Q \to M'$. The algorithm makes two recursive calls to $T; \Sigma \models P \stackrel{u}{\simeq} Q = UC_1$ and $T; \Sigma \models N' \stackrel{u}{\simeq} M' = UC_2$ returning $\Sigma \vdash UC_1 \& UC_2 = UC$ as the result.

It is clear that P, N', Q, and M' are normalized, and that T; $\operatorname{dom}(\Sigma) \vdash P$, T; $\operatorname{dom}(\Sigma) \vdash N'$ $T \vdash Q$, and $T \vdash M'$. This way, the induction hypothesis is applicable to both recursive calls By applying the induction hypothesis to T; $\Sigma \vdash P \stackrel{u}{\simeq} Q \rightrightarrows UC_1$, we have:

- $\Sigma \vdash UC_1 : \mathbf{uv} \mathbf{P}$,
- for any $\Sigma \vdash \widehat{\sigma}' : UC_1$, $[\widehat{\sigma}']P = Q$.

By applying it to T; $\Sigma \models N' \stackrel{u}{\simeq} M' = UC_2$, we have:

- $\Sigma \vdash UC_2 : \mathbf{uv} \mathbf{N}'$,
- for any $\Sigma \vdash \widehat{\sigma}' : UC_2$, $[\widehat{\sigma}'] N' = M'$.

Let us take an arbitrary $\Sigma \vdash \widehat{\sigma} : UC$. By the soundness of the constraint merge (lemma 81) $\Sigma \vdash UC_1 \& UC_2 = UC$ implies $\Sigma \vdash \widehat{\sigma} : UC_1$ and $\Sigma \vdash \widehat{\sigma} : UC_2$.

Applying the induction hypothesis to $\Sigma \vdash \widehat{\sigma} : UC_1$, we have $[\widehat{\sigma}]P = Q$; applying it to 3725 $\Sigma \vdash \widehat{\sigma} : UC_2$, we have $[\widehat{\sigma}] N' = M'$. This way, $[\widehat{\sigma}] N = [\widehat{\sigma}] P \to [\widehat{\sigma}] N' = Q \to M' = M$. 3726 Case 4. (\forall^{ω}) , then $N = \forall \alpha^{+}$. N' and $M = \forall \alpha^{+}$. M'. The algorithm makes a recursive call to 3727 3728 $T, \overrightarrow{\alpha^+}; \Sigma \models N' \stackrel{u}{\simeq} M' = UC$ returning UC as the result. 3729 The induction hypothesis is applicable: $T, \overrightarrow{\alpha^+}$; $\operatorname{dom}(\Sigma) \vdash N'$ and $T, \overrightarrow{\alpha^+} \vdash M'$ hold by 3730 inversion, and N' and M' are normalized, since N and M are. Let us take an arbitrary 3731 $\Sigma \vdash \widehat{\sigma} : UC$. By the induction hypothesis, $[\widehat{\sigma}]N' = M'$. Then $[\widehat{\sigma}]N = [\widehat{\sigma}]\forall \alpha^{+}$. $N' = (\widehat{\sigma})^{-1}$ 3732 $\forall \alpha^{+}$. $[\widehat{\sigma}] N' = \forall \alpha^{+}$. M' = M. 3733 **Case** 5. (UVAR $\stackrel{\text{"}}{=}$), then $N = \widehat{\alpha}^-$, $\widehat{\alpha}^-$ { Θ } $\in \Sigma$, and $\Theta \vdash M$. As the result, the algorithm returns 3734 $UC = (\widehat{\alpha}^- :\simeq M).$ 3735 It is clear that $\widehat{\alpha}^-\{\Theta\} \vdash (\widehat{\alpha}^- :\simeq M)$, since $\Theta \vdash M$, meaning that $\Sigma \vdash UC$. 3736 Let us take an arbitrary $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : UC$. Since $UC = (\widehat{\alpha}^- : \simeq M), \Sigma \vdash \widehat{\sigma} : UC$ implies 3737 $\Sigma(\widehat{\alpha}^-) \vdash [\widehat{\sigma}]\widehat{\alpha}^- : (\widehat{\alpha}^- : \simeq M)$. By inversion of $(:\simeq^{\text{AAT}})$, it means $\Sigma(\widehat{\alpha}^-) \vdash [\widehat{\sigma}]\widehat{\alpha}^- \simeq^{\leqslant} M$. This 3738 way, $\Sigma(\widehat{\alpha}^-) \vdash [\widehat{\sigma}] N \simeq^{\epsilon} M$. Notice that $\widehat{\sigma}$ and N are normalized, and by lemma 41, so is 3739 $[\widehat{\sigma}]N$. Since both sides of $\Sigma(\widehat{\alpha}^-) \vdash [\widehat{\sigma}]N \simeq^{\epsilon} M$ are normalized, by lemma 46, we have 3740 $[\widehat{\sigma}]N = M.$ **Case 6**. The positive cases are proved symmetrically. 3742 3744 3745 **Lemma 65** (Completeness of Unification). + For normalized P and Q such that T; $\operatorname{dom}(\Sigma) \vdash P$ and $T \vdash Q$, suppose that there exists $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(\mathbf{P})$ such that $[\widehat{\sigma}]\mathbf{P} = \mathbf{O}$, then $T; \Sigma \models \mathbf{P} \stackrel{u}{\simeq} \mathbf{O} = \mathbf{UC}$ for some UC. - For normalized N and M such that T; $\operatorname{dom}(\Sigma) \vdash N$ and $T \vdash M$, suppose that there exists $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(N)$ such that $[\widehat{\sigma}] N = M$, then $T; \Sigma \models N \stackrel{u}{\simeq} M = UC$ for some UC. PROOF. We prove it by induction on the structure of P and mutually, N. 3752 Case 1. $N = \widehat{\alpha}^-$ 3754 T; **dom** $(\Sigma) \vdash \widehat{\alpha}^-$ means that $\widehat{\alpha}^- \{\Theta\} \in \Sigma$ for some Θ . Let us take an arbitrary $\Sigma \vdash \widehat{\sigma} : \widehat{\alpha}^-$ such that $[\widehat{\sigma}]\widehat{\alpha}^- = M$. $\Sigma \vdash \widehat{\sigma} : \widehat{\alpha}^-$ means that $\Theta \vdash M$ 3756 This way, $(UVAR^{\frac{u}{\alpha}})$ is applicable to infer $T; \Sigma \models \widehat{\alpha}^{-\frac{u}{\alpha}} M = (\widehat{\alpha}^{-} : \simeq M)$. Case 2. $N = \alpha^-$ 3758 Let us take an arbitrary $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(\alpha^-)$ such that $[\widehat{\sigma}]\alpha^- = M$. Since $\mathbf{uv}(\alpha^-) = \emptyset$, $[\widehat{\sigma}]\alpha^- = M$ means $M = \alpha^-$. 3760 This way, $(VAR^{\frac{u}{\geq}})$ infers $T; \Sigma \models \alpha^{-\frac{u}{\geq}} \alpha^{-} \exists \cdot$, which is rewritten as $T; \Sigma \models N \stackrel{u}{\geq} M \exists \cdot$. 3761 Case 3. $N = \uparrow P$ 3762 Let us take an arbitrary $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(P)$ such that $[\widehat{\sigma}] \uparrow P = M$. The latter means $\uparrow [\widehat{\sigma}] P = M$. 3763 i.e. $M = \uparrow Q$ for some Q and $[\widehat{\sigma}]P = Q$. 3764 Let us show that the induction hypothesis is applicable to $\widehat{\sigma} P = Q$. Notice that P is 3765 normalized, since $N = \uparrow P$ is normalized, $T : \mathbf{dom}(\Sigma) \vdash P$ holds by inversion of $T : \mathbf{dom}(\Sigma) \vdash$ 3766 $\uparrow P$, and $T \vdash Q$ holds by inversion of $T \vdash \uparrow Q$. 3767 This way, by the induction hypothesis there exists UC such that $T: \Sigma \models \mathbb{P} \stackrel{u}{\simeq} O = UC$. 3768 Case 4. $N = P \rightarrow N'$ 3769 Let us take an arbitrary $\Sigma \vdash \widehat{\sigma} : \mathbf{uv} (P \to N')$ such that $[\widehat{\sigma}](P \to N') = M$. The latter

means $[\widehat{\sigma}] P \to [\widehat{\sigma}] N' = M$, i.e. $M = Q \to M'$ for some Q and M', such that $[\widehat{\sigma}] P = Q$ and

3770

3771

3772 3773

 $[\widehat{\sigma}]N'=M'.$

Let us show that the induction hypothesis is applicable to $\Sigma \vdash \widehat{\sigma}|_{\mathbf{uv}(P)} : \mathbf{uv}(P)$ and $[\widehat{\sigma}|_{\mathbf{uv}(P)}]P = Q$ (the latter holds since $[\widehat{\sigma}|_{\mathbf{uv}(P)}]P = [\widehat{\sigma}]P$ by lemma 55),

- P is normalized, since $N = P \rightarrow N'$ is normalized
- T; $\operatorname{dom}(\Sigma) \vdash P$ follows from the inversion of T; $\operatorname{dom}(\Sigma) \vdash P \to N'$,
- $T \vdash Q$.

Then by the induction hypothesis, $T; \Sigma \models P \stackrel{u}{\simeq} Q = UC_1$. Analogously, the induction hypothesis is applicable to $[\widehat{\sigma}|_{\mathbf{uv} \ \mathbf{N'}}] \mathbf{N'} = M'$, and thus, $T; \Sigma \models \mathbf{N'} \stackrel{u}{\simeq} M' = UC_2$.

To apply $(\to^{\underline{u}})$ and infer the required $T; \Sigma \models \mathbb{N} \stackrel{u}{\simeq} M = UC$, it is left to show that $\Sigma \vdash UC_1 \& UC_2 = UC$. It holds by completeness of the unification constraint merge (lemma 63) for $\Sigma \vdash UC_1 : \mathbf{uv} \stackrel{P}{\to} \Sigma \vdash UC_2 : \mathbf{uv} \stackrel{N'}{\to} (\text{which hold by soundness})$, and $\Sigma \vdash \widehat{\sigma} : \mathbf{uv} (\stackrel{P}{\to}) \cup \mathbf{uv} (\stackrel{N'}{\to})$, which holds since $\mathbf{uv} (\stackrel{P}{\to}) \cup \mathbf{uv} (\stackrel{N'}{\to}) = \mathbf{uv} (\stackrel{P}{\to} \stackrel{N'}{\to})$. Notice that by soundness, $\Sigma \vdash \widehat{\sigma}|_{\mathbf{uv} (\stackrel{P}{\to})} : UC_1$, which implies $\Sigma \vdash \widehat{\sigma} : UC_1$. Analogously, $\Sigma \vdash \widehat{\sigma} : UC_2$.

Case 5. $N = \forall \overrightarrow{\alpha^+}$. N'

Let us take an arbitrary $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(N')$ such that $[\widehat{\sigma}] \forall \overrightarrow{\alpha^+}. N' = M$. The latter means $\forall \overrightarrow{\alpha^+}. [\widehat{\sigma}] N' = M$, i.e. $M = \forall \overrightarrow{\alpha^+}. M'$ for some M' such that $[\widehat{\sigma}] N' = M'$.

Let us show that the induction hypothesis is applicable to $[\widehat{\sigma}] N' = M'$. Notice that N' is normalized, since $N = \forall \overrightarrow{\alpha^+}$. N' is normalized, $T, \overrightarrow{\alpha^+}$; $\operatorname{dom}(\Sigma) \vdash N'$ follows from inversion of T; $\operatorname{dom}(\Sigma) \vdash \forall \overrightarrow{\alpha^+}$. N', $T, \overrightarrow{\alpha^+} \vdash M'$ follows from inversion of $T \vdash \forall \overrightarrow{\alpha^+}$. M', and $\Sigma \vdash \widehat{\sigma} : \operatorname{uv}(N')$ by assumption.

This way, by the induction hypothesis, $T, \overrightarrow{\alpha^+}; \Sigma \models N' \stackrel{u}{\simeq} M' = UC$ exists and moreover, $\Sigma \vdash \widehat{\sigma} : UC$. Hence, $(\forall^{\stackrel{u}{\simeq}})$ is applicable to infer $T; \Sigma \models \forall \overrightarrow{\alpha^+}. N' \stackrel{u}{\simeq} \forall \overrightarrow{\alpha^+}. M' = UC$, that is $T; \Sigma \models N \stackrel{u}{\simeq} M = UC$.

Case 6. The positive cases are proved symmetrically.

9.7 Anti-unification

Observation 5 (Determinism of Anti-unification Algorithm).

- + If $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ and $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon', Q', \widehat{\tau}_1', \widehat{\tau}_2')$, then $\Upsilon = \Upsilon', Q = Q', \widehat{\tau}_1 = \widehat{\tau}_1'$, and $\widehat{\tau}_2 = \widehat{\tau}_2'$.
- If $T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ and $T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon', M', \widehat{\tau}_1', \widehat{\tau}_2')$, then $\Upsilon = \Upsilon', M = M'$, $\widehat{\tau}_1 = \widehat{\tau}_1'$, and $\widehat{\tau}_2 = \widehat{\tau}_2'$.

PROOF. By trivial induction on $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ and mutually on $T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$.

Observation 6 (Uniqueness of Anti-unification Variable Names). Names of the anti-unification variables are uniquely defined by the types they are mapped to by the resulting substitutions.

- + Assuming P_1 and P_2 are normalized, if $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, \mathbb{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ then for any $\widehat{\beta}^- \in \Upsilon$ $\widehat{\beta}^- = \widehat{\alpha}^-_{\{[\widehat{\tau}_1]\widehat{\beta}^-, [\widehat{\tau}_2]\widehat{\beta}^-\}}$
- Assuming N_1 and N_2 are normalized, if $T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ then for any $\widehat{\beta}^- \in \Upsilon$, $\widehat{\beta}^- = \widehat{\alpha}^-_{\{\{\widehat{\tau}_1\}\widehat{\beta}^-, \{\widehat{\tau}_2\}\widehat{\beta}^-\}}$

PROOF. By simple induction on $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ and mutually on $T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$. Let us consider tha last rule applied to infer this judgment.

- **Case 1.** $(VAR^{\frac{\alpha}{+}})$ or $(VAR^{\frac{\alpha}{-}})$, then $\Upsilon = \cdot$, and the property holds vacuously.
- Case 2. (AU) Then $\Upsilon = \widehat{\alpha}_{\{N_1,N_2\}}$, $\widehat{\tau}_1 = \widehat{\alpha}_{\{N_1,N_2\}} \mapsto N_1$, and $\widehat{\tau}_2 = \widehat{\alpha}_{\{N_1,N_2\}} \mapsto N_2$. So the property holds trivially.
- Case 3. $(\rightarrow^{\stackrel{a}{\sim}})$ In this case, $\Upsilon = \Upsilon' \cup \Upsilon''$, $\widehat{\tau}_1 = \widehat{\tau}_1' \cup \widehat{\tau}_1''$, and $\widehat{\tau}_2 = \widehat{\tau}_2' \cup \widehat{\tau}_2''$, where the property holds for $(\Upsilon', \widehat{\tau}_1', \widehat{\tau}_2')$ and $(\Upsilon'', \widehat{\tau}_1'', \widehat{\tau}_2'')$ by the induction hypothesis. Then since the union of solutions does not change the types the variables are mapped to, the required property holds for Υ , $\widehat{\tau}_1$, and $\widehat{\tau}_2$.
- **Case 4**. For the other rules, the resulting Υ is taken from the recursive call and the required property holds immediately by the induction hypothesis.

Lemma 66 (Soundness of Anti-Unification).

- + Assuming P_1 and P_2 are normalized, if $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ then
 - (1) $T : \Upsilon \vdash Q$,
 - (2) $T : \Gamma_i : \Upsilon$ for $i \in \{1, 2\}$ are anti-unification substitutions, and
 - (3) $[\hat{\tau}_i] Q = P_i \text{ for } i \in \{1, 2\}.$
- Assuming N_1 and N_2 are normalized, if $T \models N_1 \stackrel{a}{\simeq} N_2 \dashv (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ then
 - (1) $T : \Upsilon \vdash M$,
 - (2) $T : \Gamma_i : \Gamma$ for $i \in \{1, 2\}$ are anti-unification substitutions, and
 - (3) $[\hat{\tau}_i]M = N_i \text{ for } i \in \{1, 2\}.$

PROOF. We prove it by induction on $T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ and mutually, $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$. Let us consider the last rule applied to infer this judgement.

- Case 1. (VAR^{α}_{-}) , then $N_1 = \alpha^- = N_2$, $\Upsilon = \cdot$, $M = \alpha^-$, and $\widehat{\tau}_1 = \widehat{\tau}_2 = \cdot$.
 - (1) $T : \cdot \vdash \alpha^-$ follows from the assumption $T \vdash \alpha^-$,
 - (2) $T : \cdot \vdash \cdot : \cdot$ holds trivially, and
 - (3) $[\cdot]\alpha^- = \alpha^-$ holds trivially.
- Case 2. $(\uparrow^{\stackrel{a}{\sim}})$, then $N_1 = \uparrow P_1$, $N_2 = \uparrow P_2$, and the algorithm makes the recursive call: $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$, returning $(\Upsilon, \uparrow Q, \widehat{\tau}_1, \widehat{\tau}_2)$ as the result.

Since $N_1 = \uparrow P_1$ and $N_2 = \uparrow P_2$ are normalized, so are P_1 and P_2 , and thus, the induction hypothesis is applicable to $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$:

- (1) $T : \Upsilon \vdash Q$, and hence, $T : \Upsilon \vdash \uparrow Q$,
- (2) $T : \cdot \vdash \widehat{\tau_i} : \Upsilon \text{ for } i \in \{1, 2\}, \text{ and }$
- (3) $[\widehat{\tau}_i]Q = P_i$ for $i \in \{1, 2\}$, and then by the definition of the substitution, $[\widehat{\tau}_i] \uparrow Q = \uparrow P_i$ for $i \in \{1, 2\}$.
- Case 3. $(\rightarrow^{\stackrel{a}{\smile}})$, then $N_1 = P_1 \rightarrow N_1'$, $N_2 = P_2 \rightarrow N_2'$, and the algorithm makes two recursive calls: $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ and $T \models N_1' \stackrel{a}{\simeq} N_2' = (\Upsilon', M, \widehat{\tau}_1', \widehat{\tau}_2')$ and and returns $(\Upsilon \cup \Upsilon', Q \rightarrow M, \widehat{\tau}_1 \cup \widehat{\tau}_1', \widehat{\tau}_2 \cup \widehat{\tau}_2')$ as the result.

Notice that the induction hypothesis is applicable to $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, \mathbb{Q}, \widehat{\tau}_1, \widehat{\tau}_2) \colon P_1$ and P_2 are normalized, since $N_1 = P_1 \to N_1'$ and $N_2 = P_2 \to N_2'$ are normalized. Similarly, the induction hypothesis is applicable to $T \models N_1' \stackrel{a}{\simeq} N_2' = (\Upsilon', \mathbb{M}, \widehat{\tau}_1', \widehat{\tau}_2')$.

This way, by the induction hypothesis:

(1) $T : \Upsilon \vdash Q$ and $T : \Upsilon' \vdash M$. Then by weakening (corollary 22), $T : \Upsilon \cup \Upsilon' \vdash Q$ and $T : \Upsilon \cup \Upsilon' \vdash M$, which implies $T : \Upsilon \cup \Upsilon' \vdash Q \rightarrow M$;

- (2) $T : \Gamma \vdash \widehat{\tau}_i : \Upsilon$ and $T : \Gamma \vdash \widehat{\tau}_i' : \Upsilon'$ Then $T : \Gamma \vdash \widehat{\tau}_i \cup \widehat{\tau}_i' : \Upsilon \cup \Upsilon'$ are well-defined anti-unification substitutions. Let us take an arbitrary $\widehat{\beta}^- \in \Upsilon \cup \Upsilon'$. If $\widehat{\beta}^- \in \Upsilon$. then $T : \Gamma \mapsto \widehat{\tau}_i : \Upsilon$ implies that $\widehat{\tau}_i$, and hence, $\widehat{\tau}_i \cup \widehat{\tau}'_i$ contains an entry well-formed in T. If $\widehat{\beta} \in \Upsilon'$, the reasoning is symmetric.
 - $\widehat{ au_i} \cup \widehat{ au_i'}$ is a well-defined anti-unification substitution: any anti-unification variable occurs uniquely $\hat{\tau}_i \cup \hat{\tau}'_i$, since by observation 6, the name of the variable is in one-to-one correspondence with the pair of types it is mapped to by $\hat{\tau}_1$ and $\hat{\tau}_2$, an is in one-to-one correspondence with the pair of types it is mapped to by $\widehat{\tau}'_1$ and $\widehat{\tau}'_2$ i.e. if $\beta \in \Upsilon \cap \Upsilon'$ then $[\widehat{\tau}_1]\widehat{\beta}^- = [\widehat{\tau}_1']\widehat{\beta}^-$, and $[\widehat{\tau}_2]\widehat{\beta}^- = [\widehat{\tau}_2']\widehat{\beta}^-$.
- (3) $[\widehat{\tau}_i] Q = P_i$ and $[\widehat{\tau}'_i] M = N'_i$. Since $\widehat{\tau}_i \cup \widehat{\tau}'_i$ restricted to Υ is $\widehat{\tau}_i$, and $\widehat{\tau}_i \cup \widehat{\tau}'_i$ restricted to Υ' is $\widehat{\tau}_i'$, we have $[\widehat{\tau}_i \cup \widehat{\tau}_i'] Q = P_i$ and $[\widehat{\tau}_i \cup \widehat{\tau}_i'] M = N_i'$, and thus, $[\widehat{\tau}_i \cup \widehat{\tau}_i'] Q \to M = P_1 \to N_1'$

Case 4. $(\forall^{\overset{a}{\simeq}})$, then $N_1 = \forall \overrightarrow{\alpha^+}$. N_1' , $N_2 = \forall \overrightarrow{\alpha^+}$. N_2' , and the algorithm makes a recursive call $T \models N_1' \stackrel{a}{\simeq} N_2' = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ and returns $(\Upsilon, \forall \alpha^+, M, \widehat{\tau}_1, \widehat{\tau}_2)$ as the result.

Similarly to case 2, we apply the induction hypothesis to $T \models N_1' \stackrel{a}{\simeq} N_2' = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ to

- (1) $T : \Upsilon \vdash M$, and hence, $T : \Upsilon \vdash \forall \overrightarrow{\alpha^+}$. M:
- (2) $T : \Gamma \mapsto \widehat{\tau}_i : \Gamma \text{ for } i \in \{1, 2\}, \text{ and } i \in \{1, 2\}$
- (3) $[\widehat{\tau_i}]M = N_i'$ for $i \in \{1, 2\}$, and then by the definition of the substitution, $[\widehat{\tau_i}] \forall \overrightarrow{\alpha^+}$. M = $\forall \alpha^{+}$. N'_{i} for $i \in \{1, 2\}$.

Case 5. (AU), which applies when other rules do not, and $T \vdash N_i$, returning as the result $(\Upsilon, \underline{M}, \widehat{\tau}_1, \widehat{\tau}_2) = (\widehat{\alpha}_{\{N_1, N_2\}}^-, \widehat{\alpha}_{\{N_1, N_2\}}^-, (\widehat{\alpha}_{\{N_1, N_2\}}^- \mapsto N_1), (\widehat{\alpha}_{\{N_1, N_2\}}^- \mapsto N_2)).$

- (1) T; Y ⊢ M is rewritten as T; \$\hat{\alpha}_{\{N_1,N_2\}} + \hat{\alpha}_{\{N_1,N_2\}},\$ which holds trivially;
 (2) T; · ⊢ \$\hat{\alpha}_i\$: Y is rewritten as T; · ⊢ \$(\hat{\alpha}_{\{N_1,N_2\}} \dots N_i) : \$\hat{\alpha}_{\{N_1,N_2\}}\$, which holds since T ⊢ N_i by the premise of the rule;
- (3) $[\widehat{\tau}_i]M = N_i$ is rewritten as $[\widehat{\alpha}_{\{N_1,N_2\}}^- \mapsto N_i]\widehat{\alpha}_{\{N_1,N_2\}}^- = N_i$, which holds trivially by the definition of substitution.

Case 6. Positive cases are proved symmetrically.

Lemma 67 (Completeness of Anti-Unification).

- + Assume that P_1 and P_2 are normalized, and there exists $(\Upsilon', Q', \widehat{\tau}'_1, \widehat{\tau}'_2)$ such that
 - (1) $T: \Upsilon' \vdash Q'$
 - (2) $T : \Gamma_i : \Gamma_$
 - (3) $[\widehat{\tau}'_i]Q' = P_i \text{ for } i \in \{1, 2\}.$

Then the anti-unification algorithm terminates, that is there exists $(\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ such that $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, \mathcal{O}, \widehat{\tau}_1, \widehat{\tau}_2)$

- Assume that N_1 and N_2 are normalized, and there exists $(\Upsilon', M', \widehat{\tau}'_1, \widehat{\tau}'_2)$ such that (1) $T : \Upsilon' \vdash M'$,
 - (2) $T : \Gamma_i : \Gamma'_i : \Gamma'_i \text{ for } i \in \{1, 2\}, \text{ are anti-unification substitutions, and } if T : T is a substitution of the substitution of th$
 - (3) $[\hat{\tau}'_i]M' = N_i \text{ for } i \in \{1, 2\}.$

Then the anti-unification algorithm succeeds, that is there exists $(\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$ such that $T \models$ $N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2).$

PROOF. We prove it by the induction on M' and mutually on Q'

3917

3918

```
Case 1. M' = \widehat{\alpha}^- Then since T : + \widehat{\tau}'_i : \Upsilon', T + [\widehat{\tau}'_i]M' = N_i. This way, (AU) is always
3921
                                         applicable if other rules are not.
3922
                                 Case 2. M' = \alpha^- Then \alpha^- = [\widehat{\tau}'_i]\alpha^- = N_i, which means that (VAR^{\stackrel{a}{\sim}}) is applicable.
3923
3924
                                 Case 3. M' = \uparrow Q' Then \uparrow [\widehat{\tau}'_i] Q' = [\widehat{\tau}'_i] \uparrow Q' = N_i, that is N_1 and N_2 have form \uparrow P_1 and \uparrow P_2
3925
                                         respectively.
3926
                                         Moreover, [\widehat{\tau}'_i] Q' = P_i, which means that (\Upsilon', Q', \widehat{\tau}'_i, \widehat{\tau}'_2) is an anti-unifier of P_1 and P_2. Then
3927
                                         by the induction hypothesis, there exists (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2) such that T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2)
3928
                                        and hence, T \models \uparrow P_1 \stackrel{a}{\simeq} \uparrow P_2 = (\Upsilon, \uparrow Q, \widehat{\tau}_1, \widehat{\tau}_2) by (\uparrow^{\stackrel{a}{\simeq}}).
3929
                                Case 4. M' = \forall \alpha^{+}. M'' This case is similar to the previous one: we consider \forall \alpha^{+} as a
3930
                                        constructor. Notice that \forall \overrightarrow{\alpha^+}. [\widehat{\tau}_i]M'' = [\widehat{\tau}_i'] \forall \overrightarrow{\alpha^+}. M'' = N_i, that is N_1 and N_2 have form
3931
                                        \forall \overrightarrow{\alpha^+}. N_1'' and \forall \overrightarrow{\alpha^+}. N_2'' respectively.
3932
                                         Moreover, [\hat{\tau}'_i]M'' = N''_i, which means that (\Upsilon', M'', \hat{\tau}'_1, \hat{\tau}'_2) is an anti-unifier of N''_1 and
3933
                                        N_2''. Then by the induction hypothesis, there exists (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2) such that T \models N_1'' \stackrel{a}{\simeq} N_2'' =
                                        (\Upsilon, \underline{M}, \widehat{\tau}_1, \widehat{\tau}_2), and hence, T \models \forall \alpha^{\overrightarrow{+}}. N_1'' \stackrel{a}{\simeq} \forall \alpha^{\overrightarrow{+}}. N_2'' = (\Upsilon, \forall \alpha^{\overrightarrow{+}}. \underline{M}, \widehat{\tau}_1, \widehat{\tau}_2) by (\forall \widetilde{\simeq}).
3936
                                 Case 5. M' = Q' \to M'' Then [\widehat{\tau}_i] Q' \to [\widehat{\tau}_i'] M'' = [\widehat{\tau}_i'] (Q' \to M'') = N_i, that is N_1 and
                                         N_2 have form P_1 \rightarrow N'_1 and P_2 \rightarrow N'_2 respectively.
                                         Moreover, [\widehat{\tau}'_i] \underline{Q}' = P_i and [\widehat{\tau}'_i] \underline{M}'' = \overline{N}''_i, which means that (\Upsilon', \underline{Q}', \widehat{\tau}'_i, \widehat{\tau}'_2) is an anti-unifier
                                         of P_1 and P_2, and (\Upsilon', M'', \widehat{\tau}'_1, \widehat{\tau}'_2) is an anti-unifier of N''_1 and N''_2. Then by the induction
3940
                                        hypothesis, T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon_1, Q, \widehat{\tau}_1, \widehat{\tau}_2) and T \models N_1'' \stackrel{a}{\simeq} N_2'' = (\Upsilon_2, M, \widehat{\tau}_3, \widehat{\tau}_4) succeed. The
                                        result of the algorithm is (\Upsilon_1 \cup \Upsilon_2, Q \to M, \widehat{\tau}_1 \cup \widehat{\tau}_3, \widehat{\tau}_2 \cup \widehat{\tau}_4).
                                  Case 6. Q' = \widehat{\alpha}^+ This case if not possible, since T : \Upsilon' \vdash Q' means \widehat{\alpha}^+ \in \Upsilon', but \Upsilon' can only
                                         contain negative variables.
                                  Case 7. Other positive cases are proved symmetrically to the corresponding negative ones.
3946
3947
                   Lemma 68 (Initiality of Anti-Unification).
3948
                                + Assume that P_1 and P_2 are normalized, and T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2), then (\Upsilon, Q, \widehat{\tau}_1, \widehat{\tau}_2) is
                                         more specific than any other sound anti-unifier (\Upsilon', Q', \widehat{\tau}'_1, \widehat{\tau}'_2), i.e. if
3950
                                           (1) T: \Upsilon' \vdash \mathcal{O}',
                                           (2) T : \vdash \widehat{\tau}'_i : \Upsilon' \text{ for } i \in \{1, 2\}, \text{ and }
3952
                                           (3) [\hat{\tau}'_i]Q' = P_i \text{ for } i \in \{1, 2\}
                                         then there exists \widehat{\rho} such that T: \Upsilon \vdash \widehat{\rho}: (\Upsilon'|_{\mathbf{uv} \ \mathbf{0'}}) and [\widehat{\rho}] \ \mathbf{Q'} = \mathbf{Q}. Moreover, [\widehat{\rho}] \widehat{\beta}^- can be
3954
                                         uniquely determined by [\widehat{\tau}'_1]\widehat{\beta}^-, [\widehat{\tau}'_2]\widehat{\beta}^-, and T.
3956
                                - Assume that N_1 and N_2 are normalized, and T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2), then (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)
3957
                                         is more specific than any other sound anti-unifier (\Upsilon', M', \widehat{\tau}'_1, \widehat{\tau}'_2), i.e. if
3958
                                           (1) T : \Upsilon' \vdash M'
                                           (2) T : \Gamma_i : \Gamma' \text{ for } i \in \{1, 2\}, \text{ and } i 
3960
                                           (3) [\widehat{\tau}'_i]M' = N_i \text{ for } i \in \{1, 2\}
3961
                                         then there exists \widehat{\rho} such that T; \Upsilon \vdash \widehat{\rho} : (\Upsilon'|_{\mathbf{uv} M'}) and [\widehat{\rho}] M' = M. Moreover, [\widehat{\rho}] \widehat{\beta}^- can be
3962
3963
                                         uniquely determined by [\widehat{\tau}'_1]\widehat{\beta}^-, [\widehat{\tau}'_2]\widehat{\beta}^-, and T.
3964
```

which satisfies the required properties: • $T : \Upsilon \vdash \widehat{\rho} : (\Upsilon'|_{\mathbf{uv} M'})$ holds since $\Upsilon'|_{\mathbf{uv} M'} = \widehat{\alpha}^-$ and $T : \Upsilon \vdash M$ by the soundness of

PROOF. First, let us assume that M' is a algorithmic variable $\widehat{\alpha}^-$. Then we can take $\widehat{\rho} = \widehat{\alpha}^- \mapsto M$

3965

3966

3967

3968 3969 • $I : I \vdash \rho : (I'|_{uv M'})$ holds since $I'|_{uv M'} = \alpha$ and $I' : I \vdash M$ by the soundness of anti-unification (lemma 66);

• $[\widehat{\rho}]M' = M$ holds by construction

 • $[\widehat{\rho}]\widehat{\alpha}^- = M$ is the anti-unifier of $N_1 = [\widehat{\tau}_1']\widehat{\alpha}^-$ and $N_2 = [\widehat{\tau}_2']\widehat{\alpha}^-$ in context T, and hence, it is uniquely determined by them (observation 5).

Now, we can assume that M' is not a algorithmic variable. We prove by induction on the derivation of $T \models P_1 \stackrel{a}{\simeq} P_2 = (\Upsilon, \mathbb{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ and mutually on the derivation of $T \models N_1 \stackrel{a}{\simeq} N_2 = (\Upsilon, M, \widehat{\tau}_1, \widehat{\tau}_2)$.

Since M' is not a algorithmic variable, the substitution acting on M' preserves its outer constructor. In other words, $[\hat{\tau}'_i]M' = N_i$ means that M', N_1 and N_2 have the same outer constructor. Let us consider the algorithmic anti-unification rule corresponding to this constructor, and show that it was successfully applied to anti-unify N_1 and N_2 (or P_1 and P_2).

Case 1. $(VAR^{\frac{\alpha}{2}})$, i.e. $N_1 = \alpha^- = N_2$. This rule is applicable since it has no premises. Then $\Upsilon = \cdot$, $M = \alpha^-$, and $\widehat{\tau}_1 = \widehat{\tau}_2 = \cdot$. Since $[\widehat{\tau}_i']M' = N_i = \alpha^-$ and M' is not a algorithmic variable, $M' = \alpha^-$. Then we can take $\widehat{\rho} = \cdot$, which satisfies the required properties:

- $T : \Upsilon \vdash \widehat{\rho} : (\Upsilon'|_{uv M'})$ holds vacuously since $\Upsilon'|_{uv M'} = \emptyset$;
- $[\widehat{\rho}]M' = M$, that is $[\cdot]\alpha^- = \alpha^-$ holds by substitution properties;
- the unique determination of $[\widehat{\rho}]\widehat{\alpha}^-$ for $\widehat{\alpha}^- \in \Upsilon'|_{uvM'} = \emptyset$ holds vacuously.

Case 2. $(\uparrow^{\stackrel{a}{\simeq}})$, i.e. $N_1 = \uparrow P_1$ and $N_2 = \uparrow P_2$.

Then since $[\widehat{\tau}'_i]M' = N_i = \uparrow P_i$ and M' is not a algorithmic variable, $M' = \uparrow Q'$, where $[\widehat{\tau}'_i]Q' = P_i$. Let us show that $(\Upsilon', Q', \widehat{\tau}'_1, \widehat{\tau}'_2)$ is an anti-unifier of P_1 and P_2 .

- (1) $T : \Upsilon' \vdash Q'$ holds by inversion of $T : \Upsilon' \vdash \uparrow Q'$;
- (2) $T : \Gamma_i : \Gamma'$ holds by assumption;
- (3) $[\widehat{\tau}'_i] Q' = P_i$ holds by assumption.

This way, by the completeness of anti-unification (lemma 67), the anti-unification algorithm succeeds on P_1 and P_2 : $T
varrangle P_1
varrangle (\chi, \overline{Q}, \hat{\tau}_1, \hat{\tau}_2), which means that <math>(\uparrow^{\frac{a}{2}})$ is applicable to infer $T
varrangle (\chi, \overline{P}_1 \overline{\tau}, \chi, \overline{Q}, \hat{\tau}_1, \hat{\tau}_2).$

Moreover, by the induction hypothesis, $(\Upsilon, \mathcal{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ is more specific than $(\Upsilon', \mathcal{Q}', \widehat{\tau}_1, \widehat{\tau}_2)$ which immediately implies that $(\Upsilon, \uparrow \mathcal{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ is more specific than $(\Upsilon', \uparrow \mathcal{Q}', \widehat{\tau}_1, \widehat{\tau}_2)$ (we keep the same $\widehat{\rho}$).

Case 3. (\forall^{α}) , i.e. $N_1 = \forall \overrightarrow{\alpha^+}$. N_1' and $N_2 = \forall \overrightarrow{\alpha^+}$. N_2' . The proof is symmetric to the previous case. Notice that the context T is not changed in (\forall^{α}) , as it represents the context in which the anti-unification variables must be instantiated, rather than the context forming the types that are being anti-unified.

Case 4. $(\rightarrow^{\frac{a}{2}})$, i.e. $N_1 = P_1 \rightarrow N_1'$ and $N_2 = P_2 \rightarrow N_2'$.

Then since $[\widehat{\tau}'_i]M' = N_i = P_i \to N'_i$ and M' is not a algorithmic variable, $M' = Q' \to M''$ where $[\widehat{\tau}'_i]Q' = P_i$ and $[\widehat{\tau}'_i]M'' = N''_i$.

Let us show that $(\Upsilon', Q', \widehat{\tau}'_1, \widehat{\tau}'_2)$ is an anti-unifier of P_1 and P_2 .

- (1) $T : \Upsilon' \vdash Q'$ holds by inversion of $T : \Upsilon' \vdash Q' \rightarrow M''$;
- (2) $T : \Gamma_i : \Gamma'$ holds by assumption;
- (3) $[\widehat{\tau}'_i]Q' = P_i$ holds by assumption.

Similarly, $(\Upsilon', M'', \widehat{\tau}'_1, \widehat{\tau}'_2)$ is an anti-unifier of N''_1 and N''_2 .

Then by the completeness of anti-unification (lemma 67), the anti-unification algorithm succeeds on P_1 and P_2 : $T \models P_1 \stackrel{a}{\cong} P_2 = (\Upsilon_1, Q, \widehat{\tau}_1, \widehat{\tau}_2)$; and on N'_1 and N'_2 : $T \models N''_1 \stackrel{a}{\cong} N''_2 = (\Upsilon_2, M''', \widehat{\tau}_3, \widehat{\tau}_4)$. Notice that $\widehat{\tau}_1 \& \widehat{\tau}_3$ and $\widehat{\tau}_2 \& \widehat{\tau}_4$ are defined, in other words, for any $\widehat{\beta} \in \Upsilon_1 \cap \Upsilon_2$, $[\widehat{\tau}_1]\widehat{\beta} = [\widehat{\tau}_2]\widehat{\beta}$ and $[\widehat{\tau}_3]\widehat{\beta} = [\widehat{\tau}_4]\widehat{\beta}$, which follows immediately from

observation 6. This way, the algorithm proceeds by applying $(\to^{\stackrel{a}{\simeq}})$ and returns $(\Upsilon_1 \cup \Upsilon_2, \cite{Q} \to M''', \widehat{\tau}_1 \cup \widehat{\tau}_3, \widehat{\tau}_2 \cup \widehat{\tau}_4)$.

It is left to construct $\widehat{\rho}$ such that T; $\Upsilon \vdash \widehat{\rho} : (\Upsilon'|_{\mathbf{uv} M'})$ and $[\widehat{\rho}] M' = M$. By the induction hypothesis, there exist $\widehat{\rho}_1$ and $\widehat{\rho}_2$ such that T; $\Upsilon_1 \vdash \widehat{\rho}_1 : (\Upsilon'|_{\mathbf{uv} Q'})$, T; $\Upsilon_2 \vdash \widehat{\rho}_2 : (\Upsilon'|_{\mathbf{uv} M''})$, $[\widehat{\rho}_1] Q' = Q$, and $[\widehat{\rho}_2] M'' = M'''$.

Let us show that $\widehat{\rho} = \widehat{\rho}_1 \cup \widehat{\rho}_2$ satisfies the required properties:

- $T : \Upsilon_1 \cup \Upsilon_2 \vdash \widehat{\rho}_1 \cup \widehat{\rho}_2 : (\Upsilon'|_{\mathbf{uv} M'}) \text{ holds since } \Upsilon'|_{\mathbf{uv} M'} = \Upsilon'|_{\mathbf{uv} Q' \to M''} = (\Upsilon'|_{\mathbf{uv} Q'}) \cup (\Upsilon'|_{\mathbf{uv} M''}), T : \Upsilon_1 \vdash \widehat{\rho}_1 : (\Upsilon'|_{\mathbf{uv} Q'}) \text{ and } T : \Upsilon_2 \vdash \widehat{\rho}_2 : (\Upsilon'|_{\mathbf{uv} M''});$
- $[\widehat{\rho}]M' = [\widehat{\rho}](Q' \to M'') = [\widehat{\rho}|_{uv}Q']Q' \to [\widehat{\rho}|_{uv}M'']M'' = [\widehat{\rho}_1]Q' \to [\widehat{\rho}_2]M'' = Q \to M''' = M;$
- Since $[\widehat{\rho}]\widehat{\beta}^-$ is either equal to $[\widehat{\rho}_1]\widehat{\beta}^-$ or $[\widehat{\rho}_2]\widehat{\beta}^-$, it inherits their property that it is uniquely determined by $[\widehat{\tau}'_1]\widehat{\beta}^-$, $[\widehat{\tau}'_2]\widehat{\beta}^-$, and T.

Case 5. $P_1 = P_2 = \alpha^+$. This case is symmetric to case 1.

Case 6. $P_1 = \downarrow N_1$ and $P_2 = \downarrow N_2$. This case is symmetric to case 2

Case 7. $P_1 = \exists \overrightarrow{\alpha}$. P_1' and $P_2 = \exists \overrightarrow{\alpha}$. P_2' . This case is symmetric to case 3

9.8 Upper Bounds

 Observation 7 (Determinism of Least Upper Bound algorithm). For types $T \vdash P_1$, and $T \vdash P_2$, if $T \models P_1 \lor P_2 = Q$ and $T \models P_1 \lor P_2 = Q'$ then Q = Q'.

PROOF. The shape of P_1 and P_2 uniquely determines the rule applied to infer the upper bound By looking at the inference rules, it is easy to see that the result of the least upper bound algorithm depends on

- the inputs of the algorithm (that is P_1 , P_2 , and T), which are fixed;
- the result of the anti-unification algorithm applied to normalized input, which is deterministic by observation 5;
- the result of the recursive call, which is deterministic by the induction hypothesis.

Lemma 69 (Characterization of the Supertypes). Let us define the set of upper bounds of a positive type UB(P) in the following way:

```
T \vdash P
T \vdash \beta^{+}
T \vdash \beta^{+}
T \vdash \exists \overrightarrow{\beta^{-}}. Q
UB(T, \overrightarrow{\beta^{-}} \vdash Q) \text{ not using } \overrightarrow{\beta^{-}}
T \vdash \downarrow M
\exists \overrightarrow{\alpha^{-}}. \downarrow M' \mid \text{ for } \overrightarrow{\alpha^{-}}, M', \text{ and } \overrightarrow{N} \text{ s.t.}
T \vdash N_{i}, T, \overrightarrow{\alpha^{-}} \vdash M', \text{ and } [\overrightarrow{N}/\overrightarrow{\alpha^{-}}] \downarrow M' \simeq^{D} \downarrow M
Then UB(T \vdash P) \equiv \{Q \mid T \vdash Q \geqslant P\}.
```

PROOF. By induction on $T \vdash P$.

Case 1. $P = \beta^+$ Immediately from lemma 17 Case 2. $P = \exists \beta^-$. P'

Then if $T + Q \ge \exists \overrightarrow{\beta}^-$. P', then by lemma 16, $T, \overrightarrow{\beta}^- + Q \ge P'$, and $fv Q \cap \overrightarrow{\beta}^- = \emptyset$ by the

convention. The other direction holds by (\exists^{\geqslant}) . This way, $\{Q \mid T \vdash Q \geqslant \exists \overline{\beta^{-}}, P'\} = \{Q \mid T, \overrightarrow{\beta^{-}} \vdash Q \geqslant P' \text{ s.t. fv } (Q) \cap \overrightarrow{\beta^{-}} = \emptyset\}$. From the induction hypothesis, the latter is equal to $\mathsf{UB}(T, \overrightarrow{\beta^{-}} \vdash P')$ not using $\overrightarrow{\beta^{-}}$, i.e. $\mathsf{UB}(T \vdash \exists \overrightarrow{\beta^{-}}, P')$.

Then let us consider two subcases upper bounds without outer quantifiers (we denote the corresponding set restriction as $|_{\frac{1}{2}}$) and upper bounds with outer quantifiers ($|_{\frac{1}{2}}$). We prove that for both of these groups, the restricted sets are equal.

- a. $Q \neq \exists \overline{\beta}^{-2}$. Q'Then the last applied rule to infer $T \vdash Q \geqslant \downarrow M$ must be (\downarrow^{\geqslant}) , which means $Q = \downarrow M'$ and by inversion, $T \vdash M' \simeq^{\leqslant} M$, then by lemma 32 and (\downarrow^{\simeq^D}) , $\downarrow M' \simeq^D \downarrow M$. This way $Q = \downarrow M' \in \{\downarrow M' \mid \downarrow M' \simeq^D \downarrow M\} = \mathsf{UB}(T \vdash \downarrow M)|_{\frac{\pi}{2}}$. In the other direction, $\downarrow M' \simeq^D \downarrow M \Rightarrow T \vdash \downarrow M' \simeq^{\leqslant} \downarrow M$ by lemmas 26 and 27
- $\Rightarrow T \vdash \downarrow M' \geqslant \downarrow M \quad \text{by inversion}$ b. $O = \exists \overrightarrow{\beta}^{-}. O' \text{ (for non-empty } \overrightarrow{\beta}^{-}\text{)}$
- Then the last rule applied to infer $T \vdash \exists \overrightarrow{\beta^-}$. $Q' \geqslant \downarrow M$ must be (\exists^{\geqslant}) . Inversion of this rule gives us $T \vdash [\overrightarrow{N}/\overrightarrow{\beta^-}]Q' \geqslant \downarrow M$ for some $T \vdash N_i$. Notice that $[\overrightarrow{N}/\overrightarrow{\beta^-}]Q'$ has no outer quantifiers. Thus from case 3.a, $[\overrightarrow{N}/\overrightarrow{\beta^-}]Q' \simeq^D \downarrow M$, which is only possible if $Q' = \downarrow M'$ This way, $Q = \exists \overrightarrow{\beta^-}$. $\downarrow M' \in \mathsf{UB}(T \vdash \downarrow M)|_{\exists}$ (notice that $\overrightarrow{\beta^-}$ is not empty). In the other direction,

$$[\overrightarrow{N}/\overrightarrow{\beta^{-}}] \downarrow M' \simeq^{D} \downarrow M \Rightarrow T \vdash [\overrightarrow{N}/\overrightarrow{\beta^{-}}] \downarrow M' \simeq^{\leqslant} \downarrow M \quad \text{by lemmas 26 and 27}$$

$$\Rightarrow T \vdash [\overrightarrow{N}/\overrightarrow{\beta^{-}}] \downarrow M' \geqslant \downarrow M \quad \text{by inversion}$$

$$\Rightarrow T \vdash \exists \overrightarrow{\beta^{-}}. \downarrow M' \geqslant \downarrow M \quad \text{by } (\exists^{\geqslant})$$

Lemma 70 (Characterization of the Normalized Supertypes). For a normalized positive type $P = \inf(P)$, let us define the set of normalized upper bounds in the following way:

```
T \vdash P \qquad \qquad \mathsf{NFUB}(T \vdash P)
T \vdash \beta^{+} \qquad \qquad \{\beta^{+}\}
T \vdash \exists \overrightarrow{\beta^{-}}. P \qquad \qquad \mathsf{NFUB}(T, \overrightarrow{\beta^{-}} \vdash P) \ \textit{not using } \overrightarrow{\beta^{-}}
T \vdash \downarrow M \qquad \left\{ \exists \overrightarrow{\alpha^{-}}. \downarrow M' \ \middle| \ \textit{for } \overrightarrow{\alpha^{-}}, M', \textit{and } \overrightarrow{N} \textit{ s.t. ord } \overrightarrow{\alpha^{-}} \textit{ in } M' = \overrightarrow{\alpha^{-}}, \right.
T \vdash N_{i}, T, \overrightarrow{\alpha^{-}} \vdash M', \textit{and } [\overrightarrow{N}/\overrightarrow{\alpha^{-}}] \downarrow M' = \downarrow M 
Then \ \mathsf{NFUB}(T \vdash P) \equiv \{\mathsf{nf}(Q) \ \middle| \ T \vdash Q \geqslant P\}.
```

Proof. By induction on $T \vdash P$.

Case 1.
$$P = \beta^+$$

Then from lemma 69, $\{ \mathbf{nf}(Q) \mid T \vdash Q \geqslant \beta^+ \} = \{ \mathbf{nf}(\exists \overrightarrow{\alpha}^-. \beta^+) \mid \text{ for some } \overrightarrow{\alpha}^- \} = \{ \beta^+ \}$

```
Case 2. P = \exists \beta^{-}. P'
4117
                           NFUB(T + \exists \overrightarrow{\beta}^{-}. P')
4118
4119
                            = NFUB(T, \overrightarrow{\beta}^{-} + P') not using \overrightarrow{\beta}^{-}
4120
                            = \{ \mathbf{nf}(Q) \mid T, \overrightarrow{\beta}^{-} \vdash Q \geqslant P' \} \text{ not using } \overrightarrow{\beta}^{-}
                                                                                                                                    by the induction hypothesis
4122
                            = {nf (Q) \mid T, \overrightarrow{\beta}^- \vdash Q \ge P' s.t. fv Q \cap \overrightarrow{\beta}^- = \emptyset}
                                                                                                                                    \mathbf{fv} \, \mathbf{nf} \, (\mathbf{Q}) = \mathbf{fv} \, \mathbf{Q} \, \mathbf{by} \, \mathbf{lemma} \, 38
                            = \{ \mathbf{nf}(Q) \mid Q \in \mathsf{UB}(T, \overrightarrow{\beta}^- \vdash P') \text{ s.t. } \mathbf{fv} \ Q \cap \overrightarrow{\beta}^- = \emptyset \}
                                                                                                                                    by lemma 69
                            = \{ \mathbf{nf} ( \bigcirc ) \mid \bigcirc \in \mathsf{UB}(T \vdash \exists \overrightarrow{\beta} \cdot P') \}
                                                                                                                                    by the definition of UB
4126
                            = \{ \mathbf{nf} (O) \mid T \vdash O \geqslant \exists \overrightarrow{\beta}^{-}. P' \}
                                                                                                                                    by lemma 69
4127
                      Case 3. P = \downarrow M Let us prove the set equality by two inclusions.
4128
                              \subseteq Suppose that T \vdash Q \geqslant \downarrow M and M is normalized.
4129
                                    By lemma 69, Q \in UB(T + \downarrow M). Then by definition of UB, Q = \exists \overrightarrow{\alpha}. \downarrow M' for some \overrightarrow{\alpha}
4130
                                    M', and T \vdash \sigma : \overrightarrow{\alpha} s.t. [\sigma] \downarrow M' \simeq^D \downarrow M.
4131
                                    We need to show that \mathbf{nf}(Q) \in \mathsf{NFUB}(T \vdash \bigcup M). Notice that \mathbf{nf}(Q) = \mathbf{nf}(\exists \alpha = \bigcup M') = \bigcup M
4132
                                    \exists \alpha^{-1}_{0}. \downarrow M_{0}, where nf (M') = M_{0} and ord \alpha^{-1} in M_{0} = \alpha^{-1}_{0}.
4133
                                    The belonging of \exists \overrightarrow{\alpha}_0^-. \downarrow M_0 to NFUB(T \vdash \downarrow M) means that
4134
                                        (1) ord \alpha_0 in M_0 = \alpha_0 and
                                        (2) that there exists T \vdash \sigma_0 : \alpha^{-1}_0 such that [\sigma_0] \downarrow M_0 = \downarrow M.
                                    The first requirement holds by corollary 13. To show the second requirement, we
                                    construct \sigma_0 as nf (\sigma|_{\mathbf{fv}M'}). Let us show the required properties of \sigma_0:
                                        (1) T \vdash \sigma_0 : \overrightarrow{\alpha}_0. Notice that by lemma 5, T \vdash \sigma|_{\mathbf{fv}(M')} : \overrightarrow{\alpha} \cap \mathbf{fv}(M'), which we
                                                rewrite as T \vdash \sigma|_{\mathbf{fv}(M')} : \overrightarrow{\alpha}|_0 (since by lemma 33 \overrightarrow{\alpha}|_0 = \overrightarrow{\alpha}|_0 \cap \mathbf{fv}(M_0) as sets, and
                                               \mathbf{fv}(M_0) = \mathbf{fv}(M') by lemma 38). Then by lemma 40, T \vdash \mathbf{nf}(\sigma|_{\mathbf{fv}(M')}) : \overline{\alpha}_0^2, that
                                               is T \vdash \sigma_0 : \overrightarrow{\alpha}_0.
                                        (2) [\sigma_0] \downarrow M_0 = \downarrow M. [\sigma] \downarrow M' \simeq^D \downarrow M means [\sigma]_{f_Y(M')} \downarrow M' \simeq^D \downarrow M by lemma 4. Then
                                                by lemma 43, \operatorname{nf}([\sigma|_{\operatorname{fv}(M')}]\downarrow M') = \operatorname{nf}(\downarrow M), implying [\sigma_0]\downarrow M_0 = \operatorname{nf}(\downarrow M) by
                                                lemma 41, and further [\sigma_0] \downarrow M_0 = \downarrow M by lemma 44 (since \downarrow M is normal by
                                               assumption).
                              \supseteq Suppose that a type belongs to NFUB(T \vdash \bigcup M) for a normalized \bigcup M. Then it must have
                                    shape \exists \overrightarrow{\alpha}_0^- \cup M_0 for some \overrightarrow{\alpha}_0^- \cup M_0, and T \vdash \sigma_0 : \overrightarrow{\alpha}_0^- \cup M_0 such that ord \overrightarrow{\alpha}_0^- \cup M_0 = \overrightarrow{\alpha}_0^- \cup M_0
                                    and [\sigma_0] \downarrow M_0 = \downarrow M. It suffices to show that (1) \exists \overrightarrow{\alpha}_0. \downarrow M_0 is normalized itself, and
                                    (2) T \vdash \exists \overline{\alpha}_0^2 . \downarrow M_0 \geqslant \downarrow M.
                                        (1) By definition, \mathbf{nf} (\exists \overrightarrow{\alpha}_0. \downarrow M_0) = \exists \overrightarrow{\alpha}_1. \downarrow M_1, where M_1 = \mathbf{nf} (M_0) and
                                                ord \alpha_0^- in M_1 = \overline{\alpha_0}^-. First, notice that by lemmas 37 and 39, ord \overline{\alpha_0}^- in M_1 =
4152
                                                ord \overrightarrow{\alpha}_0 in M_0 = \overrightarrow{\alpha}_0. This way, \mathbf{nf} (\exists \overrightarrow{\alpha}_0 . \downarrow M_0) = \exists \overrightarrow{\alpha}_0 . \downarrow \mathbf{nf} (M_0). Second, M_0
4154
                                                is normalized by lemma 45, since [\sigma_0] \downarrow M_0 = \downarrow M is normal. As such,
4155
                                                \mathbf{nf} (\exists \overline{\alpha}_0^-, \downarrow M_0) = \exists \overline{\alpha}_0^-, \downarrow M_0, in other words, \exists \overline{\alpha}_0^-, \downarrow M_0 is normalized.
4156
                                        (2) T \vdash \exists \overrightarrow{\alpha}_0 . \downarrow M_0 \geqslant \downarrow M holds immediately by (\exists^{\geqslant}) with the substitution \sigma_0. Notice
4157
                                                that T \vdash [\sigma_0] \downarrow M_0 \geqslant \downarrow M follows from [\sigma_0] \downarrow M_0 = \downarrow M by reflexivity of subtyping
4158
                                                (lemma 20).
```

Lemma 71. Upper bounds of a type do not depend on the context as soon as the type is well-formed in it.

If $T_1 \vdash P$ and $T_2 \vdash P$ then $\mathsf{UB}(T_1 \vdash P) = \mathsf{UB}(T_2 \vdash P)$ and $\mathsf{NFUB}(T_1 \vdash P) = \mathsf{NFUB}(T_2 \vdash P)$

4204 4205 4206

4207 4208 4209

4210 4211 4212 PROOF. We prove both inclusions by structural induction on P.

Case 1. $P = \beta^+$ Then $UB(T_1 + \beta^+) = UB(T_2 + \beta^+) = \{\exists \overrightarrow{\alpha} : \beta^+ \mid \text{ for some } \overrightarrow{\alpha}^-\}$. NFUB $(T_1 + \beta^+) = \{\exists \overrightarrow{\alpha} : \beta^+ \mid \text{ for some } \overrightarrow{\alpha}^-\}$. β^+) = NFUB $(T_2 + \beta^+) = \{\beta^+\}$.

Case 2. $P = \exists \overrightarrow{\beta}^{-}$. P'. Then $UB(T_1 \vdash \exists \overrightarrow{\beta}^{-}$. $P') = UB(T_1, \overrightarrow{\beta}^{-} \vdash P')$ not using $\overrightarrow{\beta}^{-}$. $UB(T_2 \vdash P')$ $\exists \overrightarrow{\beta^-}. \ \underline{P'}) = \mathsf{UB}(T_2, \overrightarrow{\beta^-} + \underline{P'})$ not using $\overrightarrow{\beta^-}$. By the induction hypothesis, $\mathsf{UB}(T_1, \overrightarrow{\beta^-} + \underline{P'}) =$ $UB(T_2, \overrightarrow{\beta^-} + P')$, and if we restrict these sets to the same domain, they stay equal. Analogously, NFUB $(T_1 \vdash \exists \overrightarrow{\beta}^-. P') = \text{NFUB}(T_2 \vdash \exists \overrightarrow{\beta}^-. P').$

Case 3. $P = \downarrow M$. Suppose that $\exists \overrightarrow{\alpha}^- . \downarrow M' \in UB(T_1 \vdash \downarrow M)$. It means that $T_1, \overrightarrow{\alpha}^- \vdash M'$ and there exist $T_1 \vdash \overrightarrow{N}$ s.t. $[\overrightarrow{N}/\overrightarrow{\alpha^2}] \downarrow M' \simeq^D \downarrow M$, or in other terms, there exists $T_1 \vdash \sigma : \overrightarrow{\alpha^2}$ such that $[\sigma] \downarrow M' \simeq^D \downarrow M.$

We need to show that $\exists \overrightarrow{\alpha}$. $\downarrow M' \in UB(T_2 \vdash \downarrow M)$, in other words, T_2 , $\overrightarrow{\alpha} \vdash M'$ and there exists $T_2 \vdash \sigma_0 : \overrightarrow{\alpha}^{=}$ such that $[\sigma_0] \downarrow M' \simeq^{D} \downarrow M$.

First, let us show $T_2, \overrightarrow{\alpha} \vdash M'$. Notice that $[\sigma] \downarrow M' \simeq^D \downarrow M$ implies $\mathbf{fv}([\sigma]M') = \mathbf{fv}(\downarrow M)$ by lemma 24. By lemma 13, $\mathbf{fv}(M') \setminus \overrightarrow{\alpha^2} \subseteq \mathbf{fv}([\sigma]M')$. This way, $\mathbf{fv}(M') \setminus \overrightarrow{\alpha^2} \subseteq \mathbf{fv}(M)$ implying $\mathbf{fv}(M') \subseteq \mathbf{fv}(M) \cup \overrightarrow{\alpha}$. By lemma 1, $T_2 \vdash \bigcup M$ implies $\mathbf{fv}(M) \subseteq T_2$, hence, $\mathbf{fv}(M') \subseteq T_2$ $(T_2, \overrightarrow{\alpha^2})$, which by corollary 1 means $T_2, \overrightarrow{\alpha^2} \vdash M'$.

Second, let us construct the required σ_0 in the following way:

$$\begin{cases} [\sigma_0]\alpha_i^- = [\sigma]\alpha_i^- & \text{for } \alpha_i^- \in \overrightarrow{\alpha} \cap \mathbf{fv} (M') \\ [\sigma_0]\alpha_i^- = \forall \gamma^+. \uparrow \gamma^+ & \text{for } \alpha_i^- \in \overrightarrow{\alpha} \setminus \mathbf{fv} (M') \\ [\sigma_0]\gamma^{\pm} = \gamma^{\pm} & \text{for any other } \gamma^{\pm} \end{cases}$$

This construction of a substitution coincides with the one from the proof of lemma 18. This way, for σ_0 , hold the same properties:

- (1) $[\sigma_0]M' = [\sigma]M'$, which in particular, implies $[\sigma_0] \downarrow M = [\sigma] \downarrow M$, and thus, $[\sigma] \downarrow M' \simeq^D$ $\downarrow M$ can be rewritten to $[\sigma_0] \downarrow M' \simeq^D \downarrow M$; and
- (2) **fv** $([\sigma]M') \vdash \sigma_0 : \overrightarrow{\alpha}$, which, as noted above, can be rewritten to **fv** $(M) \vdash \sigma_0 : \overrightarrow{\alpha}$, and since **fv** $M \subseteq T_2$, weakened to $T_2 \vdash \sigma_0 : \overrightarrow{\alpha}$.

The proof of NFUB($T_1 \vdash \downarrow M$) \subseteq NFUB($T_2 \vdash \downarrow M$) is analogous. The differences are:

- (1) ord $\overrightarrow{\alpha}$ in $M' = \overrightarrow{\alpha}$ holds by assumption,
- (2) $[\sigma] \downarrow M' = \downarrow M$ implies $\text{fv}([\sigma]M') = \text{fv}(\downarrow M)$ by rewriting,
- (3) $[\sigma] \downarrow M' = \downarrow M$ and $[\sigma_0] \downarrow M = [\sigma] \downarrow M$ imply $[\sigma_0] \downarrow M' = \downarrow M$ by rewriting.

Lemma 72 (Soundness of the Least Upper Bound). For types $T \vdash P_1$, and $T \vdash P_2$, if $T \models P_1 \lor P_2 = Q$ then

```
(i) T \vdash Q
(ii) T \vdash Q \geqslant P_1 and T \vdash Q \geqslant P_2
```

PROOF. Induction on $T \models P_1 \lor P_2 = Q$.

Case 1. $T \models \alpha^+ \lor \alpha^+ = \alpha^+$

Then $T \vdash \alpha^+$ by assumption, and $T \vdash \alpha^+ \ge \alpha^+$ by (VAR^{\ge}_+) .

Case 2. $T \models \exists \overrightarrow{\alpha}$. $P_1 \lor \exists \overrightarrow{\beta}$. $P_2 = Q$

Then by inversion of $T \vdash \exists \overrightarrow{\alpha}$. P_i and weakening, $T, \overrightarrow{\alpha}$, $\overrightarrow{\beta}$ $\vdash P_i$, hence, the induction hypothesis applies to $T, \overrightarrow{\alpha}, \overrightarrow{\beta} \models P_1 \lor P_2 = Q$. Then

- (i) $T, \overrightarrow{\alpha}^{-}, \overrightarrow{\beta}^{-} \vdash Q$, (ii) $T, \overrightarrow{\alpha}^{-}, \overrightarrow{\beta}^{-} \vdash Q \geqslant P_{1}$,
- (iii) $T, \overrightarrow{\alpha}, \overrightarrow{\beta} + O \geqslant P_2$

To prove $T \vdash Q$, it suffices to show that $\operatorname{fv}(Q) \cap (T, \overrightarrow{\alpha}, \overrightarrow{\beta}) = \operatorname{fv}(Q) \cap T$ (and then apply lemma 2). The inclusion right-to-left is self-evident. To show $\operatorname{fv}(Q) \cap (T, \overrightarrow{\alpha}, \overrightarrow{\beta}) \subseteq \operatorname{fv}(Q) \cap T$, we prove that $\operatorname{fv}(Q) \subseteq T$.

fv $(Q) \subseteq \operatorname{fv} P_1 \cap \operatorname{fv} P_2$ by lemma 15

$$\subseteq ((T, \overrightarrow{\alpha}) \setminus \overrightarrow{\beta}) \cap ((T, \overrightarrow{\beta}) \setminus \overrightarrow{\alpha}) \quad \text{since } T \vdash \exists \overrightarrow{\alpha} \cdot P_1, \text{ fv } (P_1) \subseteq (T, \overrightarrow{\alpha}) = (T, \overrightarrow{\alpha}) \setminus \overrightarrow{\beta} \text{ (the latter is because by the}$$

Barendregt's convention,
$$(T, \overrightarrow{\alpha}) \cap \overrightarrow{\beta}^{-} = \emptyset$$
)
similarly, $\mathbf{fv}(P_2) \subseteq (T, \overrightarrow{\beta}^{-}) \setminus \overrightarrow{\alpha}^{-}$

 $\subseteq T$

 To show $T \vdash Q \geqslant \exists \overrightarrow{\alpha}$. P_1 , we apply (\exists^{\geqslant}) . Then $T, \overrightarrow{\alpha} \vdash Q \geqslant P_1$ holds since $T, \overrightarrow{\alpha}, \overrightarrow{\beta} \vdash Q \geqslant P_1$ (by the induction hypothesis), $T, \overrightarrow{\alpha} \vdash Q$ (by weakening), and $T, \overrightarrow{\alpha} \vdash P_1$. Judgment $T \vdash Q \geqslant \exists \overrightarrow{\beta}$. P_2 is proved symmetrically.

Case 3. $T \models JN \lor JM = \exists \overrightarrow{\alpha}$. $[\overrightarrow{\alpha}]^{P}$. By the inversion, $T, \cdot \models \mathbf{nf}(JN) \stackrel{a}{\simeq} \mathbf{nf}(JM) = (\Upsilon, P, \widehat{\tau}_1, \widehat{\tau}_2)$. Then by the soundness of anti-unification (lemma 66),

(i) $T : \Upsilon \vdash P$, then by lemma 53,

$$T, \overrightarrow{\alpha} + [\overrightarrow{\alpha}']P$$
 (7)

(ii) $T : \cdot \vdash \widehat{\tau}_1 : \Upsilon$ and $T : \cdot \vdash \widehat{\tau}_2 : \Upsilon$. Assuming that $\Upsilon = \widehat{\beta}_1^-, ..., \widehat{\beta}_n^-$, the antiunification solutions $\widehat{\tau}_1$ and $\widehat{\tau}_2$ can be put explicitly as $\widehat{\tau}_1 = (\widehat{\beta}_1^- : \simeq N_1, ..., \widehat{\beta}_n^- : \simeq N_n)$, and $\widehat{\tau}_2 = (\widehat{\beta}_1^- : \simeq M_1, ..., \widehat{\beta}_n^- : \simeq M_n)$. Then

$$\widehat{\tau}_1 = (\overrightarrow{N}/\overrightarrow{\alpha}^2) \circ (\overrightarrow{\alpha}^2/\Upsilon) \tag{8}$$

$$\widehat{\tau}_2 = (\overrightarrow{M}/\overrightarrow{\alpha}) \circ (\overrightarrow{\alpha}/\Upsilon) \tag{9}$$

(iii) $[\widehat{\tau}_1] Q = P_1$ and $[\widehat{\tau}_2] Q = P_1$, which, by 8 and 9, means

$$[\overrightarrow{N}/\overrightarrow{\alpha}^{-}][\overrightarrow{\alpha}^{-}/\Upsilon]P = \mathbf{nf}(\downarrow N) \tag{10}$$

$$[\overrightarrow{M}/\overrightarrow{\alpha}][\overrightarrow{\alpha}]/\Upsilon]P = \mathbf{nf}(\downarrow M) \tag{11}$$

Then $T \vdash \exists \overrightarrow{\alpha}$. $[\overrightarrow{\alpha}]$ follows directly from 7.

To show $T \vdash \exists \overrightarrow{\alpha}$. $[\overrightarrow{\alpha}']P \geqslant \downarrow N$, we apply (\exists^{\geqslant}) , instantiating $\overrightarrow{\alpha}$ with \overrightarrow{N} . Then $T \vdash [\overrightarrow{N}/\overrightarrow{\alpha}'][\overrightarrow{\alpha}']P \geqslant \downarrow N$ follows from 10 and since $T \vdash \mathbf{nf}(\downarrow N) \geqslant \downarrow N$ (by corollary 16). Analogously, instantiating $\overrightarrow{\alpha}$ with \overrightarrow{M} , gives us $T \vdash [\overrightarrow{M}/\overrightarrow{\alpha}'][\overrightarrow{\alpha}']P \geqslant \downarrow M$ (from 11), and

hence, $T \vdash \exists \alpha^{-}$. $[\alpha^{-}/\Upsilon]P \geqslant \downarrow M$.

Lemma 73 (Completeness and Initiality of the Least Upper Bound). For types $T \vdash P_1$, $T \vdash P_2$, and $T \vdash Q$ such that $T \vdash Q \geqslant P_1$ and $T \vdash Q \geqslant P_2$, there exists Q' s.t. $T \models P_1 \lor P_2 = Q'$ and $T \vdash Q \geqslant Q'$.

PROOF. Induction on the pair (P_1, P_2) . From lemma 70, $Q \in UB(T \vdash P_1) \cap UB(T \vdash P_2)$. Let us consider the cases of what P_1 and P_2 are (i.e. the last rules to infer $T \vdash P_i$).

Case 1. $P_1 = \exists \overrightarrow{\beta}_1^-$. $Q_1, P_2 = \exists \overrightarrow{\beta}_2^-$. Q_2 , where either $\overrightarrow{\beta}_1$ or $\overrightarrow{\beta}_2^-$ is not empty

Q \in \mathsf{UB}(T \vdash \exists \overrightarrow{\beta}^{-1}, Q_1) \cap \mathsf{UB}(T \vdash \exists \overrightarrow{\beta}^{-2}, Q_2)
4265
4266
                               \subseteq \mathsf{UB}(T, \overrightarrow{\beta}_1 \vdash O_1) \cap \mathsf{UB}(T, \overrightarrow{\beta}_2 \vdash O_2)
                                                                                                                                                                 definition of UB
4267
                               = UB(T, \overrightarrow{\beta}_1, \overrightarrow{\beta}_2 + \overrightarrow{Q}_1) \cap UB(T, \overrightarrow{\beta}_1, \overrightarrow{\beta}_2 + \overrightarrow{Q}_2)
                                                                                                                                                                 by lemma 71
4268
                               =\{Q' \mid T, \overrightarrow{\beta^-}_1, \overrightarrow{\beta^-}_2 \vdash Q' \geqslant Q_1\} \cap \{Q' \mid T, \overrightarrow{\beta^-}_1, \overrightarrow{\beta^-}_2 \vdash Q' \geqslant Q_2\} \quad \text{by lemma 69}
4269
                          It means that T, \overrightarrow{\beta^-}_1, \overrightarrow{\beta^-}_2 \vdash Q \geqslant Q_1 and T, \overrightarrow{\beta^-}_1, \overrightarrow{\beta^-}_2 \vdash Q \geqslant Q_2. Then the next step of the algorithm—the recursive call T, \overrightarrow{\beta^-}_1, \overrightarrow{\beta^-}_2 \vdash Q_1 \lor Q_2 = Q' terminates by the induction hypothesis, and moreover, T, \overrightarrow{\beta^-}_1, \overrightarrow{\beta^-}_2 \vdash Q \geqslant Q'. This way, the result of the algorithm is Q'.
4271
4273
                          i.e. T \models P_1 \lor P_2 = Q'.
4274
                          Since both Q and Q' are sound upper bounds, T \vdash Q and T \vdash Q', and therefore, T, \overrightarrow{\beta^{-1}}_{1}, \overrightarrow{\beta^{-2}}_{2} \vdash
4275
                            Q \geqslant Q' can be strengthened to T \vdash Q \geqslant Q' by lemma 18.
4276
                      Case 2. P_1 = \alpha^+ and P_2 = \downarrow N
4277
                            Then the set of common upper bounds of \downarrow N and \alpha^+ is empty, and thus, Q \in \mathsf{UB}(T \vdash \mathsf{UB}(T))
4278
                            P_1) \cap UB(T \vdash P_2) gives a contradiction:
4279
                           Q \in \mathsf{UB}(T \vdash \alpha^+) \cap \mathsf{UB}(T \vdash \downarrow N)
4280
4281
                               = \{ \exists \overrightarrow{\alpha}^-, \alpha^+ \mid \cdots \} \cap \{ \exists \overrightarrow{\beta}^-, \downarrow M' \mid \cdots \} by the definition of UB
4282
                                                                                                                since \alpha^+ \neq M' for any M'
                               = \emptyset
4283
                      Case 3. P_1 = \downarrow N and P_2 = \alpha^+
4284
                           Symmetric to case 2
4285
                      Case 4. P_1 = \alpha^+ and P_2 = \beta^+ (where \beta^+ \neq \alpha^+)
4286
                          Similarly to case 2, the set of common upper bounds is empty, which leads to the contradic-
4287
4288
                          Q \in \mathsf{UB}(T \vdash \alpha^+) \cap \mathsf{UB}(T \vdash \beta^+)
4289
                               = \{\exists \overrightarrow{\alpha}^-. \alpha^+ \mid \cdots \} \cap \{\exists \overrightarrow{\beta}^-. \beta^+ \mid \cdots \} by the definition of UB
4290
4291
                                                                                                            since \alpha^+ \neq \beta^+
                               = \emptyset
4292
                      Case 5. P_1 = \alpha^+ and P_2 = \alpha^+
4293
                          Then the algorithm terminates in one step ((VAR^{\lor})) and the result is \alpha^{+}, i.e. T \models \alpha^{+} \lor \alpha^{+} = \alpha^{+}
4294
                          Since Q \in UB(T \vdash \alpha^+), Q = \exists \overrightarrow{\alpha}^- . \alpha^+. Then T \vdash \exists \overrightarrow{\alpha}^- . \alpha^+ \geqslant \alpha^+ by (\exists^>): \overrightarrow{\alpha}^- can be instantiated
4295
                          with arbitrary negative types (for example \forall \beta^+. \uparrow \beta^+), since the substitution for unused
4296
                          variables does not change the term [\overrightarrow{N}/\overrightarrow{\alpha^-}]\alpha^+ = \alpha^+, and then T \vdash \alpha^+ \geqslant \alpha^+ by (VAR^{\geqslant}_+).
4297
                      Case 6. P_1 = \bigcup M_1 and P_2 = \bigcup M_2
4298
                          Then on the next step, the algorithm tries to anti-unify \mathbf{nf}(\downarrow M_1) and \mathbf{nf}(\downarrow M_2). By lemma 67,
4299
                           to show that the anti-unification algorithm terminates, it suffices to demonstrate that a
4300
                           sound anti-unification solution exists.
4301
                          Notice that

\mathbf{nf}(Q) \in \mathsf{NFUB}(T + \mathbf{nf}(\downarrow M_1)) \cap \mathsf{NFUB}(T + \mathbf{nf}(\downarrow M_2))
                                      = NFUB(T \vdash \int \mathbf{nf}(M_1)) \cap \text{NFUB}(T \vdash \int \mathbf{nf}(M_2))
                                                         \left\{ \exists \overrightarrow{\alpha^{2}}. \downarrow M' \mid \text{ for } \overrightarrow{\alpha^{2}}, M', \text{ and } \overrightarrow{N} \text{ s.t. } \text{ ord } \overrightarrow{\alpha^{2}} \text{ in } M' = \overrightarrow{\alpha^{2}}, \\ T \vdash N_{i}, T, \overrightarrow{\alpha^{2}} \vdash M', \text{ and } [\overrightarrow{N}/\overrightarrow{\alpha^{2}}] \downarrow M' = \downarrow \text{nf } (M_{1}) \right\}

\begin{cases}
\exists \overrightarrow{\alpha}^{-}. \downarrow M' & \text{for } \overrightarrow{\alpha}^{-}, M', \text{ and } \overrightarrow{N} \text{ s.t. ord } \overrightarrow{\alpha}^{-} \text{ in } M' = \overrightarrow{\alpha}^{-}, \\
T \vdash \overrightarrow{N}_{1}, T \vdash \overrightarrow{N}_{2}, T, \overrightarrow{\alpha}^{-} \vdash M', \text{ and } [\overrightarrow{N}/\overrightarrow{\alpha}^{-}] \downarrow M' = \downarrow \text{nf } (M_{2})
\end{cases}

                                    = \left\{ \overrightarrow{\exists \alpha}^{-}. \downarrow M' \middle| \begin{array}{c} \text{for } \overrightarrow{\alpha}^{-}, M', \overrightarrow{N}_{1} \text{ and } \overrightarrow{N}_{2} \text{ s.t. ord } \overrightarrow{\alpha}^{-} \text{ in } M' = \overrightarrow{\alpha}^{-}, \\ T \vdash \overrightarrow{N}_{1}, T \vdash \overrightarrow{N}_{2}, T, \overrightarrow{\alpha}^{-} \vdash M', [\overrightarrow{N}_{1}/\overrightarrow{\alpha}^{-}] \downarrow M' = \bigcup \text{nf } (M_{1}) \\ \text{, and } [\overrightarrow{N}_{2}/\overrightarrow{\alpha}^{-}] \downarrow M' = \bigcup \text{nf } (M_{2}) \end{array} \right\}
```

The fact that the latter set is non-empty means that there exist $\overrightarrow{\alpha}^2$, M', \overrightarrow{N}_1 and \overrightarrow{N}_2 such that (i) $T, \overrightarrow{\alpha} \vdash M'$ (notice that M' is normal)

(ii) $T \vdash \vec{N}_1$ and $T \vdash \vec{N}_1$,

(iii) $[\overrightarrow{N}_1/\overrightarrow{\alpha}] \downarrow M' = \inf (M_1)$ and $[\overrightarrow{N}_2/\overrightarrow{\alpha}] \downarrow M' = \inf (M_2)$

For each negative variable α^- from α^- , let us choose a fresh negative anti-unification variable $\widehat{\alpha}^-$, and denote the list of these variables as $\overline{\widehat{\alpha}^-}$. Let us show that $(\widehat{\alpha}^{-}, [\widehat{\alpha}^{-}/\widehat{\alpha}^{-}] \downarrow M', \overrightarrow{N}_{1}/\widehat{\alpha}^{-}, \overrightarrow{N}_{2}/\widehat{\alpha}^{-})$ is a sound anti-unifier of $\mathbf{nf}(\downarrow M_{1})$ and $\mathbf{nf}(\downarrow M_{2})$ in

- context *T*: • $\widehat{\alpha}^{-}$ is negative by construction,

 - $T: \overrightarrow{\widehat{\alpha}} \vdash [\overrightarrow{\widehat{\alpha}}/\overrightarrow{\alpha}^2] \downarrow M'$ because $T, \overrightarrow{\alpha^2} \vdash \bigcup M'$ (lemma 52), $T: \vdash (\overrightarrow{N}_1/\overrightarrow{\widehat{\alpha}}) : \overrightarrow{\widehat{\alpha}}$ because $T \vdash \overrightarrow{N}_1$ and $T: \vdash (\overrightarrow{N}_2/\overrightarrow{\widehat{\alpha}}) : \overrightarrow{\widehat{\alpha}}$ because $T \vdash \overrightarrow{N}_2$,
 - $[\overrightarrow{N}_1/\overrightarrow{\alpha}^-][\overrightarrow{\alpha}^-/\overrightarrow{\alpha}^-] \downarrow M' = [\overrightarrow{N}_1/\overrightarrow{\alpha}^-] \downarrow M' = \inf(M_1) = \inf(\downarrow M_1).$
 - $[\vec{N}_2/\widehat{\alpha}^-][\widehat{\alpha}^-/\widehat{\alpha}^-] \downarrow M' = [\vec{N}_2/\widehat{\alpha}^-] \downarrow M' = \inf(M_2) = \inf(\downarrow M_2).$

Then by the completeness of the anti-unification (lemma 67), the anti-unification algorithm terminates, so is the Least Upper Bound algorithm invoking it, i.e. $O' = \exists \vec{\beta}^-$. $[\vec{\beta}^-/\Upsilon] P$ where $(\Upsilon, P, \widehat{\tau}_1, \widehat{\tau}_2)$ is the result of the anti-unification of $\mathbf{nf}(\downarrow M_1)$ and $\mathbf{nf}(\downarrow M_2)$ in context

Moreover, lemma 67 also says that the found anti-unification solution is initial, i.e. there exists $\widehat{\tau}$ such that $T : \Upsilon \vdash \widehat{\tau} : \overrightarrow{\widehat{\alpha}}$ and $[\widehat{\tau}][\overrightarrow{\widehat{\alpha}}]/\overrightarrow{\alpha}] \downarrow M' = \underline{P}$.

Let σ be a sequential Kleisli composition of the following substitutions: (i) $\overrightarrow{\alpha}^{-}/\overrightarrow{\alpha}^{-}$, (ii) $\widehat{\tau}$, and (iii) $\overrightarrow{\beta}^-/\Upsilon$. Notice that $T, \overrightarrow{\beta}^- \vdash \sigma : \overrightarrow{\alpha}^-$ and $[\sigma] \downarrow M' = [\overrightarrow{\beta}^-/\Upsilon] [\widehat{\tau}] [\overrightarrow{\alpha}^-/\alpha^-] \downarrow M' = [\overrightarrow{\beta}^-/\Upsilon] P$ In particular, from the reflexivity of subtyping: $T, \overrightarrow{\beta}^- \vdash [\sigma] \downarrow M' \geqslant [\overrightarrow{\beta}^- / \Upsilon] P$.

It allows us to show $T \vdash \mathbf{nf}(Q) \geqslant Q'$, i.e. $T \vdash \exists \overrightarrow{\alpha}^- . \downarrow M' \geqslant \exists \overrightarrow{\beta}^- . [\overrightarrow{\beta}^- / \Upsilon] P$, by applying $(\exists^{>})$, instantiating $\overrightarrow{\alpha}$ with respect to σ . Finally, $T \vdash Q > Q'$ by transitively combining $T \vdash \mathbf{nf}(Q) \geqslant Q'$ and $T \vdash Q \geqslant \mathbf{nf}(Q)$ (holds by corollary 16 and inversion).

9.9 Upgrade

Let us consider a type P well-formed in T. Some of its T-supertypes are also well-formed in a smaller context $\Theta \subseteq T$. The upgrade is the operation that returns the least of such supertypes.

Observation 8 (Upgrade determinism). Assuming P is well-formed in $T \subseteq \Theta$, if upgrade $T \vdash P$ to $\Theta = Q$ and upgrade $T \vdash P$ to $\Theta = Q'$ are defined then Q = Q'.

PROOF. It follows directly from observation 7, and the convention that the fresh variables are chosen by a fixed deterministic algorithm (section 2.2).

4409 4410 **Lemma 74** (Soundness of Upgrade). Assuming P is well-formed in $T = \Theta$, α^{\pm} , if upgrade $T \vdash$ $P \text{ to } \Theta = Q \text{ then}$

- (1) $\Theta \vdash Q$
- (2) $T \vdash Q \geqslant P$

Lemma 93 (Soundness of Upgrade). Assuming P is well-formed in $T = \Theta, \overrightarrow{\alpha^{\pm}}$, if upgrade $T \vdash$ $P \text{ to } \Theta = Q \text{ then }$

- (1) $\Theta \vdash Q$
- (2) $T \vdash Q \geqslant P$

PROOF. By inversion, upgrade $T \vdash P \text{ to } \Theta = Q$ means that for fresh $\overrightarrow{\beta^{\pm}}$ and $\overrightarrow{\gamma^{\pm}}$, Θ , $\overrightarrow{\beta^{\pm}}$, $\overrightarrow{\gamma^{\pm}}$ \models $|\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}| \stackrel{P}{\vee} |\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}| \stackrel{P}{=} \stackrel{Q}{=}$. Then by the soundness of the least upper bound (lemma 72),

- (1) $\Theta, \overrightarrow{\beta^{\pm}}, \overrightarrow{\gamma^{\pm}} \vdash Q,$ (2) $\Theta, \overrightarrow{\beta^{\pm}}, \overrightarrow{\gamma^{\pm}} \vdash Q \geqslant [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$, and
- (3) $\Theta, \overrightarrow{\beta^{\pm}}, \overrightarrow{y^{\pm}} \vdash O \geqslant [\overrightarrow{y^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$.

 $\text{fv } O \subseteq \text{fv } [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}] P \cap \text{fv } [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}] P$

since by lemma 15, $\mathbf{f} \mathbf{v} O \subseteq \mathbf{f} \mathbf{v} [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}] P$

and
$$\text{fv } Q \subseteq \text{fv } [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}] P$$

$$\subseteq ((\mathbf{f} \mathbf{v} \overset{P}{\nearrow} \alpha^{\pm}) \cup \overrightarrow{\beta^{\pm}}) \cap ((\mathbf{f} \mathbf{v} \overset{P}{\nearrow} \alpha^{\pm}) \cup \overrightarrow{\gamma^{\pm}})$$

$$= (\mathbf{f} \mathbf{v} \overset{P}{\nearrow} \alpha^{\pm}) \cap (\mathbf{f} \mathbf{v} \overset{P}{\nearrow} \alpha^{\pm})$$

since $\overrightarrow{\beta^{\pm}}$ and $\overrightarrow{y^{\pm}}$ are fresh

$$=\mathbf{fv}\,\underline{P}\setminus\overrightarrow{\alpha^\pm}$$

$$\subseteq T\setminus \overrightarrow{\alpha^\pm}$$

since *P* is well-formed in *T*

This way, by lemma 2, $\Theta \vdash Q$.

Let us apply $\overrightarrow{\alpha^{\pm}}/\overrightarrow{\beta^{\pm}}$ —the inverse of the substitution $\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}$ to both sides of Θ , $\overrightarrow{\beta^{\pm}}$, $\overrightarrow{\gamma^{\pm}}$ + $\overrightarrow{Q} > [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$ and by lemma 21 (since $\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}$ can be specified as Θ , $\overrightarrow{\beta^{\pm}}$, $\overrightarrow{\gamma^{\pm}}$ + $\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}$: Θ , $\overrightarrow{\alpha^{\pm}}$, $\overrightarrow{\gamma^{\pm}}$ by lemma 12) obtain Θ , $\overrightarrow{\alpha^{\pm}}$, $\overrightarrow{\gamma^{\pm}} \vdash [\overrightarrow{\alpha^{\pm}}/\overrightarrow{\beta^{\pm}}] \overset{Q}{Q} \geqslant P$. Notice that $\Theta \vdash Q$ implies that $\mathbf{fv} \overset{Q}{Q} \cap \overrightarrow{\beta^{\pm}} = \emptyset$ then by corollary 3, $[\overrightarrow{\alpha^{\pm}}/\overrightarrow{\beta^{\pm}}]Q = Q$, and thus $\Theta, \overrightarrow{\alpha^{\pm}}, \overrightarrow{\gamma^{\pm}} + Q \geqslant P$. By context strengthening $\Theta, \overrightarrow{\alpha^{\pm}} \vdash O \geqslant P.$

Lemma 75 (Completeness and Initiality of Upgrade). *The upgrade returns the least T-supertype of* P well-formed in Θ . Assuming P is well-formed in $T = \Theta$, α^{\pm} , For any Q' such that

- (1) $\Theta \vdash Q'$ and
- (2) $T \vdash Q' \geqslant P$,

The result of the upgrade algorithm Q exists (upgrade $T \vdash P$ to $\Theta = Q$) and satisfies $\Theta \vdash Q' \geqslant Q$.

PROOF. Let us consider fresh (not intersecting with T) $\overrightarrow{\beta^{\pm}}$ and $\overrightarrow{\gamma^{\pm}}$.

If we apply substitution $\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}$ to both sides of Θ , $\overrightarrow{\alpha^{\pm}} \vdash Q' \geqslant P$, we have Θ , $\overrightarrow{\beta^{\pm}} \vdash [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]Q' \geqslant$ $[\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$, which by corollary 3, since $\overrightarrow{\alpha^{\pm}}$ is disjoint from $\mathbf{fv}(Q')$ (because $\Theta \vdash Q'$), simplifies to $\Theta, \overrightarrow{\beta^{\pm}} \vdash Q' \geqslant [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P.$

Analogously, if we apply substitution $\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}$ to both sides of Θ , $\overrightarrow{\alpha^{\pm}} \vdash Q' \geqslant P$, we have Θ , $\overrightarrow{\gamma^{\pm}} \vdash Q' \geqslant P$ $Q' \geqslant [\overline{\gamma^{\pm}}/\overline{\alpha^{\pm}}]P.$

This way, Q' is a common supertype of $[\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$ and $[\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$ in context Θ , $\overrightarrow{\beta^{\pm}}$, $\overrightarrow{\gamma^{\pm}}$. It means that we can apply the completeness of the least upper bound (lemma 73):

```
(1) there exists Q s.t. T = [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P \vee [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}]P = Q
```

(2) $T \vdash Q' \geqslant Q$.

 The former means that the upgrade algorithm terminates and returns Q. The latter means that since both Q' and Q are well-formed in Θ and T, by lemma 18, $\Theta \vdash Q' \geqslant Q$.

9.10 Constraint Satisfaction

Lemma 76 (Any constraint is satisfiable). *Suppose that* $\Sigma \vdash C$ *and* Υ *is a set such that* $\mathbf{dom}(C) \subseteq \Upsilon \subseteq \mathbf{dom}(\Sigma)$. *Then there exists* $\widehat{\sigma}$ *such that* $\Sigma \vdash \widehat{\sigma} : \Upsilon$ *and* $\Sigma \vdash \widehat{\sigma} : C$.

PROOF. Let us define $\widehat{\sigma}$ on **dom** (*C*) in the following way:

$$[\widehat{\sigma}]\widehat{\alpha}^{\pm} = \begin{cases} P & \text{if } (\widehat{\alpha}^{\pm} :\simeq P) \in C \\ P & \text{if } (\widehat{\alpha}^{\pm} :\geqslant P) \in C \\ N & \text{if } (\widehat{\alpha}^{\pm} :\simeq N) \in C \\ \exists \beta^{-}. \downarrow \beta^{-} & \text{if } \widehat{\alpha}^{\pm} = \widehat{\alpha}^{+} \in \Upsilon \setminus \mathbf{dom}(C) \\ \forall \beta^{+}. \uparrow \beta^{+} & \text{if } \widehat{\alpha}^{\pm} = \widehat{\alpha}^{-} \in \Upsilon \setminus \mathbf{dom}(C) \end{cases}$$

Then $\Sigma \vdash \widehat{\sigma} : C$ follows immediately from the reflexivity of equivalence and subtyping (lemma 20) and the corresponding rules $(:\simeq_+^{\text{SAT}})$, $(:\simeq_-^{\text{SAT}})$, and $(:\geqslant_+^{\text{SAT}})$.

Lemma 77 (Constraint Entry Satisfaction is Stable under Equivalence).

```
- If T \vdash N_1 : e \text{ and } T \vdash N_1 \simeq^{\leq} N_2 \text{ then } T \vdash N_2 : e.
```

+ If $T \vdash P_1 : e \text{ and } T \vdash P_1 \simeq^{\leq} P_2 \text{ then } T \vdash P_2 : e$.

PROOF. – Then *e* has form $(\widehat{\alpha}^- :\simeq M)$, and by inversion, $T \vdash N_1 \simeq^{\leq} M$. Then by transitivity, $T \vdash N_2 \simeq^{\leq} M$, meaning $T \vdash N_2 : e$.

+ Let us consider what form *e* has.

Case 1. $e = (\widehat{\alpha}^+ :\simeq Q)$. Then $T \vdash P_1 \simeq^{\leq} Q$, and hence, $T \vdash P_2 \simeq^{\leq} Q$ by transitivity. Then $T \vdash P_2 : e$.

Case 2. $e = (\widehat{\alpha}^+ : \ge Q)$. Then $T \vdash P_1 \ge Q$, and hence, $T \vdash P_2 \ge Q$ by transitivity. Then $T \vdash P_2 : e$.

Corollary 28 (Constraint Satisfaction is stable under Equivalence).

```
If \Sigma \vdash \widehat{\sigma}_1 : C and \Sigma \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : \mathbf{dom}(C) then \Sigma \vdash \widehat{\sigma}_2 : C; if \Sigma \vdash \widehat{\sigma}_1 : UC and \Sigma \vdash \widehat{\sigma}_1 : \mathbf{dom}(C) then \Sigma \vdash \widehat{\sigma}_2 : UC.
```

Corollary 29 (Normalization preserves Constraint Satisfaction).

```
If \Sigma \vdash \widehat{\sigma} : C \text{ then } \Sigma \vdash \mathbf{nf}(\widehat{\sigma}) : C;
if \Sigma \vdash \widehat{\sigma} : UC \text{ then } \Sigma \vdash \mathbf{nf}(\widehat{\sigma}) : UC.
```

9.11 Positive Subtyping

Observation 10 (Positive Subtyping is Deterministic). For fixed T, Σ , P, and Q, if T; $\Sigma \models P \geqslant Q \Rightarrow C$ and T; $\Sigma \models P \geqslant Q \Rightarrow C'$ then C = C'.

PROOF. We prove it by induction on T; $\Sigma \models P \geqslant Q = C$. First, it is easy to see that the rule applied to infer T; $\Sigma \models P \geqslant Q = C$ uniquely depends on the input, and those, it is the same rule that is inferring T; $\Sigma \models P \geqslant Q = C'$. Second, the premises of each rule are deterministic on the input: unification is deterministic by observation 4, upgrade is deterministic by observation 8, the choice of the fresh algorithmic variables is deterministic by convention, as discussed in section 2.2, positive subtyping by the induction hypothesis.

Lemma 78 (Soundness of the Positive Subtyping). If $T \vdash^{\supseteq} \Sigma$, $T \vdash Q$, T; $\mathbf{dom}(\Sigma) \vdash P$, and T; $\Sigma \vdash P \geqslant Q \dashv C$, then $\Sigma \vdash C : \mathbf{uv} P$ and for any normalized $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : C$, $T \vdash [\widehat{\sigma}] P \geqslant Q$.

PROOF. We prove it by induction on T; $\Sigma \models \mathbb{P} \geqslant Q \rightrightarrows C$. Let us consider the last rule to infer this judgment.

Case 1. (UVAR $^{\geqslant}$) then T; $\Sigma \models P \geqslant Q \Rightarrow C$ has shape T; $\Sigma \models \widehat{\alpha}^{+} \geqslant P' \Rightarrow (\widehat{\alpha}^{+} : \geqslant Q')$ where $\widehat{\alpha}^{+} \{\Theta\} \in \Sigma$ and upgrade $T \vdash P'$ to $\Theta = Q'$.

Notice that $\widehat{\alpha}^+$ { Θ } $\in \Sigma$ and $T \vdash^{\supseteq} \Sigma$ implies $T = \Theta$, $\widehat{\alpha}^{\pm}$ for some $\widehat{\alpha}^{\pm}$, hence, the soundness of upgrade (lemma 93) is applicable:

(1) $\Theta \vdash Q'$ and

 (2) $T \vdash Q' \geqslant P$.

Since $\widehat{\alpha}^+ \{\Theta\} \in \Sigma$ and $\Theta \vdash Q'$, it is clear that $\Sigma \vdash (\widehat{\alpha}^+ : \geqslant Q') : \widehat{\alpha}^+$.

It is left to show that $T \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant P'$ for any normalized $\widehat{\sigma}$ s.t. $\Sigma \vdash \widehat{\sigma} : (\widehat{\alpha}^+ : \geqslant Q')$. The latter means that $\Sigma(\widehat{\alpha}^+) \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant Q'$, i.e. $\Theta \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant Q'$. By weakening the context to T and combining this judgment transitively with $T \vdash Q' \geqslant P$, we have $T \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant P$, as required

Case 2. (VAR_+^{\geqslant}) then T; $\Sigma \models P \geqslant Q \ni C$ has shape T; $\Sigma \models \alpha^+ \geqslant \alpha^+ \ni \cdot$. Then $uv \alpha^+ = \emptyset$, and $C = \cdot$ satisfies $\Sigma \vdash C : \cdot$. Since $uv \alpha^+ = \emptyset$, application of any substitution $\widehat{\sigma}$ does not change α^+ , i.e. $[\widehat{\sigma}]\alpha^+ = \alpha^+$. Therefore, $T \vdash [\widehat{\sigma}]\alpha^+ \geqslant \alpha^+$ holds by (VAR_-^{\leq}) .

Case 3. (\downarrow^{\geqslant}) then T; $\Sigma \models P \geqslant Q \dashv C$ has shape T; $\Sigma \models \downarrow N \geqslant \downarrow M \dashv C$.

Then the next step of the algorithm is the unification of $\mathbf{nf}(N)$ and $\mathbf{nf}(M)$, and it returns the resulting unification constraint UC = C as the result. By the soundness of unification (lemma 64), $\Sigma \vdash C : \mathbf{uv}(N)$ and for any normalized $\widehat{\sigma}, \Sigma \vdash \widehat{\sigma} : C$ implies $[\widehat{\sigma}]\mathbf{nf}(N) = \mathbf{nf}(M)$, then we rewrite the left-hand side by lemma 41: $\mathbf{nf}([\widehat{\sigma}]N) = \mathbf{nf}(M)$ and apply lemma 46: $T \vdash [\widehat{\sigma}]N \cong M$, then by $(\uparrow^{\leq}), T \vdash \bigcup [\widehat{\sigma}]N \geqslant \bigcup M$.

Case 4. (\exists^{\geq}) then T; $\Sigma \models P \geq Q \exists C$ has shape T; $\Sigma \models \exists \overrightarrow{\alpha}$. $P' \geq \exists \overrightarrow{\beta}$. $Q' \exists C$ s.t. either $\overrightarrow{\alpha}$ or $\overrightarrow{\beta}$ is not empty.

Then the algorithm creates fresh unification variables $\widehat{\alpha}^{-}\{T, \overrightarrow{\beta}^{-}\}$, substitutes the old $\overrightarrow{\alpha}^{-}$ with them in \mathbf{P}' , and makes the recursive call: $T, \overrightarrow{\beta}^{-}$; $\Sigma, \widehat{\alpha}^{-}\{T, \overrightarrow{\beta}^{-}\} \models [\widehat{\alpha}^{-}/\widehat{\alpha}^{-}] \mathbf{P}' \geqslant Q' \models C'$ returning as the result $C = C' \setminus \widehat{\alpha}^{-}$.

Let us take an arbitrary normalized $\widehat{\sigma}$ s.t. $\Sigma \vdash \widehat{\sigma} : C' \setminus \overrightarrow{\widehat{\alpha}}$. We wish to show $T \vdash [\widehat{\sigma}] P \geqslant Q$ i.e. $T \vdash \exists \overrightarrow{\alpha} = (\widehat{\sigma}) P' \geqslant \exists \overrightarrow{\beta} = (\widehat{\sigma}) P' \geqslant Q'$. To do that, we apply (\exists^{\geqslant}) , and what is left to show is $T, \overrightarrow{\beta} = (\overrightarrow{N}/\overrightarrow{\alpha}) [\widehat{\sigma}] P' \geqslant Q'$ for some \overrightarrow{N} . If we construct a normalized $\widehat{\sigma}'$ such that $\Sigma, \overrightarrow{\alpha} = \{T, \overrightarrow{\beta} = \} \vdash \widehat{\sigma}' : C'$ and for some $\overrightarrow{N}, [\overrightarrow{N}/\overrightarrow{\alpha}] [\widehat{\sigma}] P' = [\widehat{\sigma}'] [\overrightarrow{\alpha} = (\overrightarrow{\alpha}) P'$, we can apply the induction hypothesis to $T, \overrightarrow{\beta} = (T, \overrightarrow{\beta}) \vdash (T, \overrightarrow$

Let us construct such $\widehat{\sigma}'$ by extending $\widehat{\sigma}$ with $\widehat{\widehat{\alpha}}'$ mapped to the corresponding types in C'

$$[\widehat{\sigma}']\widehat{\widehat{\beta}^{\pm}} = \begin{cases} [\widehat{\sigma}]\widehat{\widehat{\beta}^{\pm}} & \text{if } \widehat{\beta}^{\pm} \in \text{dom } (C') \setminus \overrightarrow{\widehat{\alpha}^{\pm}} \\ \text{nf } (N) & \text{if } \widehat{\beta}^{\pm} \in \overrightarrow{\widehat{\alpha}^{\pm}} \text{ and } (\widehat{\beta}^{\pm} : \simeq N) \in SC' \end{cases}$$

It is easy to see that $\widehat{\sigma}'$ is normalized: it inherits this property from $\widehat{\sigma}$. Let us show that $\Sigma, \widehat{\alpha}^{-}\{T, \overrightarrow{\beta}^{-}\} \vdash \widehat{\sigma}' : C'$. Let us take an arbitrary entry e from C' restricting a variable $\widehat{\beta}^{\pm}$. Suppose $\widehat{\beta}^{\pm} \in \operatorname{dom}(C') \setminus \widehat{\alpha}^{-}$. Then $(\Sigma, \widehat{\alpha}^{-}\{T, \overrightarrow{\beta}^{-}\})(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}']\widehat{\beta}^{\pm} : e$ is rewritten as $\Sigma(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\beta}^{\pm} : e$, which holds since $\Sigma \vdash \widehat{\sigma} : C'$. Suppose $\widehat{\beta}^{\pm} = \widehat{\alpha}_{i}^{-} \in \widehat{\alpha}^{-}$. Then $e = (\widehat{\alpha}_{i}^{-} : \simeq N)$ for some N, $[\widehat{\sigma}']\widehat{\alpha}_{i}^{-} = \operatorname{nf}(N)$ by the definition, and T, $\overrightarrow{\beta}^{-} \vdash \operatorname{nf}(N) : (\widehat{\alpha}_{i}^{-} : \simeq N)$ by $(:\simeq_{-}^{\operatorname{SAT}})$, since $T \vdash \operatorname{nf}(N) \simeq^{\leqslant} N$ by lemma 46.

Finally, let us show that $[\overrightarrow{N}/\overrightarrow{\alpha}][\widehat{\sigma}]P' = [\widehat{\sigma}'][\overrightarrow{\alpha}'/\overrightarrow{\alpha}]P'$. For N_i , we take the *normalized* type restricting $\widehat{\alpha}_i$ in C'. Let us take an arbitrary variable from P.

- (1) If this variable is a unification variable $\widehat{\beta}^{\pm}$, then $[\widehat{N}/\widehat{\alpha}^{\pm}][\widehat{\sigma}]\widehat{\beta}^{\pm} = [\widehat{\sigma}]\widehat{\beta}^{\pm}$, since $\Sigma \vdash \widehat{\sigma} : C' \setminus \widehat{\alpha}^{\pm}$ and $\operatorname{dom}(\Sigma) \cap \widehat{\alpha}^{\pm} = \emptyset$. Notice that $\widehat{\beta}^{\pm} \in \operatorname{dom}(\Sigma)$, which is disjoint from $\widehat{\alpha}^{\pm}$, that is $\widehat{\beta}^{\pm} \in \operatorname{dom}(C') \setminus \widehat{\alpha}^{\pm}$. This way, $[\widehat{\sigma}'][\widehat{\alpha}^{\pm}/\widehat{\alpha}^{\pm}]\widehat{\beta}^{\pm} = [\widehat{\sigma}']\widehat{\beta}^{\pm} = [\widehat{\sigma}]\widehat{\beta}^{\pm}$ by the definition of $\widehat{\sigma}'$,
- (2) If this variable is a regular variable $\beta^{\pm} \notin \overrightarrow{\alpha}$, then $[\overrightarrow{N}/\overrightarrow{\alpha}][\widehat{\sigma}]\beta^{\pm} = \beta^{\pm}$ and $[\overrightarrow{\sigma}'][\overrightarrow{\alpha}/\overrightarrow{\alpha}]\beta^{\pm} = \beta^{\pm}$.
- (3) If this variable is a regular variable $\alpha_i^- \in \overrightarrow{\alpha}$, then $[\overrightarrow{N}/\overrightarrow{\alpha}^-][\widehat{\sigma}]\alpha_i^- = N_i = \mathbf{nf}(N_i)$ (the latter equality holds since N_i is normalized) and $[\widehat{\sigma}'][\widehat{\overrightarrow{\alpha}}^-/\overrightarrow{\alpha}^-]\alpha_i^- = [\widehat{\sigma}']\widehat{\alpha}_i^- = \mathbf{nf}(N_i)$

Lemma 79 (Completeness of the Positive Subtyping). Suppose that $T \vdash^{\supseteq} \Sigma, T \vdash Q$ and $T ; \mathbf{dom}(\Sigma) \vdash P$. Then for any $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(P)$ such that $T \vdash [\widehat{\sigma}]P \geqslant Q$, there exists $T ; \Sigma \models P \geqslant Q \rightrightarrows C$ and moreover, $\Sigma \vdash \widehat{\sigma} : C$.

PROOF. Let us prove this lemma by induction on $T \vdash [\widehat{\sigma}] \stackrel{P}{\longrightarrow} Q$. Let us consider the last rule used in the derivation, but first, consider the base case for the substitution $[\widehat{\sigma}] \stackrel{P}{\longrightarrow}$:

Case 1. $\underline{P} = \exists \overrightarrow{\beta}^{-}$. $\widehat{\alpha}^{+}$ (for potentially empty $\overrightarrow{\beta}^{-}$)

Then by assumption, $T \vdash \exists \overrightarrow{\beta}^-$. $[\widehat{\sigma}] \widehat{\alpha}^+ \geqslant Q$ (where $\overrightarrow{\beta}^- \cap \text{fv} [\widehat{\sigma}] \widehat{\alpha}^+ = \emptyset$). Let us decompose Q as $Q = \exists \overrightarrow{\gamma}^-$. Q_0 , where Q_0 does not start with \exists .

By inversion, T; $\operatorname{dom}(\Sigma) \vdash \exists \overrightarrow{\beta}^{-}$. $\widehat{\alpha}^{+}$ implies $\widehat{\alpha}^{+} \{\Theta\} \in \Sigma$ for some $\Theta \subseteq T$.

By lemma 16 applied twice, $T \vdash \exists \overrightarrow{\beta^-}$. $[\widehat{\sigma}] \widehat{\alpha}^+ \geqslant \exists \overrightarrow{\gamma^-}$. Q_0 implies $T, \overrightarrow{\gamma^-} \vdash [\overrightarrow{N}/\overrightarrow{\beta^-}] [\widehat{\sigma}] \widehat{\alpha}^+ \geqslant Q_0$ for some N, and since $\overrightarrow{\beta^-} \cap \mathbf{fv}$ $([\widehat{\sigma}] \widehat{\alpha}^+) \subseteq \overrightarrow{\beta^-} \cap \Sigma(\widehat{\alpha}^+) \subseteq \overrightarrow{\beta^-} \cap T = \emptyset$, $[\overrightarrow{N}/\overrightarrow{\beta^-}] [\widehat{\sigma}] \widehat{\alpha}^+ = [\widehat{\sigma}] \widehat{\alpha}^+$, that is $T, \overrightarrow{\gamma^-} \vdash [\widehat{\sigma}] \widehat{\alpha}^+ \geqslant Q_0$.

When algorithm tires to infer the subtyping T; $\Sigma \models \exists \overrightarrow{\beta^-}$. $\widehat{\alpha}^+ \geqslant \exists \overrightarrow{\gamma^-}$. $Q_0 = C$, it applies (\exists^{\geqslant}) , which reduces the problem to T, $\overrightarrow{\gamma^-}$; Σ , $\widehat{\beta}^- \{T$, $\overrightarrow{\gamma^-}\} \models [\widehat{\beta}^-/\widehat{\beta}^-]\widehat{\alpha}^+ \geqslant Q_0 = C$, which is equivalent to T, $\overrightarrow{\gamma^-}$; Σ , $\widehat{\beta}^- \{T$, $\overrightarrow{\gamma^-}\} \models \widehat{\alpha}^+ \geqslant Q_0 = C$.

Next, the algorithm tries to apply (UVAR $^{>}$) and the resulting restriction is $C = (\widehat{\alpha}^{+} :> Q'_{0})$ where **upgrade** $T, \overrightarrow{\gamma} \vdash Q_{0}$ **to** $\Theta = Q'_{0}$.

Why does the upgrade procedure terminate? Because $[\hat{\sigma}]\hat{\alpha}^+$ satisfies the pre-conditions of the completeness of the upgrade (lemma 75):

- (1) $\Theta \vdash [\widehat{\sigma}] \widehat{\alpha}^+$ because $\Sigma \vdash \widehat{\sigma} : \widehat{\alpha}^+$ and $\widehat{\alpha}^+ \{\Theta\} \in \Sigma$,
- (2) $T, \overrightarrow{\gamma} \vdash [\widehat{\sigma}] \widehat{\alpha}^+ \geqslant Q_0$ as noted above

Moreover, the completeness of upgrade also says that Q_0' is *the least* supertype of Q_0 among types well-formed in Θ , that is $\Theta \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant Q_0'$, which means $\Sigma \vdash \widehat{\sigma} : (\widehat{\alpha}^+ : \geqslant Q_0')$, that is $\Sigma \vdash \widehat{\sigma} : C$.

Case 2. $T \vdash [\widehat{\sigma}] P \geqslant Q$ is derived by (VAR_+^{\geqslant})

Then $P = [\widehat{\sigma}]P = \alpha^+ = Q$, where the first equality holds because P is not a unification variable: it has been covered by case 1; and the second equality hold because $(VAR_+^>)$ was applied.

The algorithm applies (VAR_+^{\geqslant}) and infers $C = \cdot$, i.e. T; $\Sigma \models \alpha^+ \geqslant \alpha^+ \dashv \cdot$. Then $\Sigma \vdash \widehat{\sigma} : \cdot$ holds trivially.

Case 3. $T \vdash [\widehat{\sigma}] P \geqslant Q$ is derived by (\downarrow^{\geqslant}) ,

Then $P = \bigcup N$, since the substitution $[\widehat{\sigma}]P$ must preserve the top-level constructor of $P \neq \widehat{\alpha}^+$ (the case $P = \widehat{\alpha}^+$ has been covered by case 1), and $Q = \bigcup M$, and by inversion, $T \vdash [\widehat{\sigma}]N \simeq^{\leq} M$.

Since both types start with \downarrow , the algorithm tries to apply (\downarrow^{\geqslant}) : T; $\Sigma \models \downarrow N \geqslant \downarrow M \dashv C$. The premise of this rule is the unification of $\mathbf{nf}(N)$ and $\mathbf{nf}(M)$: T; $\Sigma \models \mathbf{nf}(N) \stackrel{u}{\simeq} \mathbf{nf}(M) \dashv UC$ And the algorithm returns it as a subtyping constraint C = UC.

To demonstrate that the unification terminates ant $\widehat{\sigma}$ satisfies the resulting constraints, we apply the completeness of the unification algorithm (lemma 65). In order to do that, we need to provide a substitution unifying $\mathbf{nf}(N)$ and $\mathbf{nf}(M)$. Let us show that $\mathbf{nf}(\widehat{\sigma})$ is such a substitution.

- $\mathbf{nf}(N)$ and $\mathbf{nf}(M)$ are normalized
- T; $dom(\Sigma) \vdash nf(N)$ because T; $dom(\Sigma) \vdash N$ (corollary 24)
- $T \vdash \mathbf{nf}(M)$ because $T \vdash M$ (corollary 14)
- $\Sigma \vdash \mathbf{nf}(\widehat{\sigma}) : \mathbf{uv}(\underline{P})$ because $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(\underline{P})$ (corollary 25)
- $T \vdash [\widehat{\sigma}] N \simeq^{\leqslant} M \Rightarrow [\widehat{\sigma}] N \simeq^{D} M$ by lemma 32 $\Rightarrow \mathbf{nf} ([\widehat{\sigma}] N) = \mathbf{nf} (M)$ by lemma 42 $\Rightarrow [\mathbf{nf} (\widehat{\sigma})] \mathbf{nf} (N) = \mathbf{nf} (M)$ by lemma 41

By the completeness of the unification, $T; \Sigma \models \mathbb{N} \stackrel{u}{\simeq} M \rightrightarrows UC$ exists, and $\Sigma \vdash \mathbf{nf}(\widehat{\sigma}) : UC$, and by corollary 28, $\Sigma \vdash \widehat{\sigma} : UC$.

Case 4. $T \vdash [\widehat{\sigma}] P \geqslant Q$ is derived by (\exists^{\geqslant}) .

We should only consider the case when the substitution $[\widehat{\sigma}]P$ results in the existential type $\exists \alpha^{-}$. P'' (for $P'' \neq \exists ...$) by congruence, i.e. $P = \exists \alpha^{-}$. P' (for $P' \neq \exists ...$) and $[\widehat{\sigma}]P' = P''$. This is because the case when $P = \exists \beta^{-}$. $\widehat{\alpha}^{+}$ has been covered (case 1), and thus, the substitution $\widehat{\sigma}$ must preserve all the outer quantifiers of P and does not generate any new ones.

This way, $P = \exists \overrightarrow{\alpha}$. P', $[\widehat{\sigma}]P = \exists \overrightarrow{\alpha}$. $[\widehat{\sigma}]P'$ (assuming $\overrightarrow{\alpha}$ does not intersect with the range of $\widehat{\sigma}$) and $Q = \exists \overrightarrow{\beta}$. Q', where either $\overrightarrow{\alpha}$ or $\overrightarrow{\beta}$ is not empty.

By inversion, $T \vdash [\sigma][\widehat{\sigma}]P' \geqslant Q'$ for some $T, \overrightarrow{\beta} \vdash \sigma : \overrightarrow{\alpha}$. Since σ and $\widehat{\sigma}$ have disjoint domains, and the range of one does not intersect with the domain of the other, they commute i.e. $T, \overrightarrow{\beta} \vdash [\widehat{\sigma}][\sigma]P' \geqslant Q'$ (notice that the tree inferring this judgement is a proper subtree of the tree inferring $T \vdash [\widehat{\sigma}]P \geqslant Q$).

At the next step, the algorithm creates fresh (disjoint with $\mathbf{uv} \ \mathbf{P}'$) unification variables $\widehat{\alpha}$ replaces $\widehat{\alpha}$ with them in \mathbf{P}' , and makes the recursive call: $T, \widehat{\beta}^-$; $\Sigma, \widehat{\alpha}^ \{T, \widehat{\beta}^-\} \models \mathbf{P}_0 \geqslant Q' = C_1$, (where $\mathbf{P}_0 = [\widehat{\alpha}/\widehat{\alpha}] \mathbf{P}'$), returning $C_1 \setminus \widehat{\alpha}$ as the result.

To show that the recursive call terminates and that $\Sigma \vdash \widehat{\sigma} : C_1 \setminus \overrightarrow{\widehat{\alpha}}$, it suffices to build $\Sigma, \overrightarrow{\widehat{\alpha}} \{T, \overrightarrow{\beta}^-\} \vdash \widehat{\sigma}_0 : \mathbf{uv}(P_0)$ —an extension of $\widehat{\sigma}$ with $\widehat{\alpha} \cap \mathbf{uv}(P_0)$ such that $T, \overrightarrow{\beta}^- \vdash [\widehat{\sigma}_0] P_0 \geqslant Q$. Then by the induction hypothesis, $\Sigma, \widehat{\alpha} \{T, \overrightarrow{\beta}^-\} \vdash \widehat{\sigma}_0 : C_1$, and hence, $\Sigma \vdash \widehat{\sigma} : C_1 \setminus \widehat{\alpha}$, as required.

Let us construct such a substitution $\widehat{\sigma}_0$:

$$[\widehat{\sigma}_0]\widehat{\beta}^{\pm} = \begin{cases} [\sigma]\alpha_i^- & \text{if } \widehat{\beta}^{\pm} = \widehat{\alpha_i}^- \in \overrightarrow{\widehat{\alpha}}^- \cap \mathbf{uv} (\underline{P}_0) \\ [\widehat{\sigma}]\widehat{\beta}^{\pm} & \text{if } \widehat{\beta}^{\pm} \in \mathbf{uv} (\underline{P}') \end{cases}$$

It is easy to see $\Sigma, \overrightarrow{\widehat{\alpha}} \{T, \overrightarrow{\beta}^-\} \vdash \widehat{\sigma}_0 : \mathbf{uv}(\underline{P}_0) : \mathbf{uv}(\underline{P}_0) = \mathbf{uv}([\overrightarrow{\widehat{\alpha}}^-/\overrightarrow{\alpha}^-]\underline{P}') = \overrightarrow{\widehat{\alpha}}^- \cap \mathbf{uv}(\underline{P}_0) \cup \mathbf{uv}(\underline{P}')$. Then

(1) for $\widehat{\alpha_i}^- \in \widehat{\alpha}^- \cap \mathbf{uv}(P_0)$, $(\Sigma, \widehat{\alpha}^- \{T, \overline{\beta}^-\})(\widehat{\alpha_i}^-) \vdash [\widehat{\sigma_0}]\widehat{\alpha_i}^-$, i.e. $T, \overline{\beta}^- \vdash [\sigma]\alpha_i^-$ holds since $T, \overline{\beta}^- \vdash \sigma : \overline{\alpha}^-$,

(2) for $\widehat{\beta}^{\pm} \in \mathbf{uv}(\underline{P}') \subseteq \mathbf{dom}(\Sigma)$, $(\Sigma, \widehat{\alpha}^{\pm} \{T, \widehat{\beta}^{\pm}\})(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_0]\widehat{\beta}^{\pm}$, i.e. $\Sigma(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\beta}^{\pm}$ holds since $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(\underline{P})$ and $\widehat{\beta}^{\pm} \in \mathbf{uv}(\underline{P}') = \mathbf{uv}(\underline{P})$.

Now, let us show that $T, \overrightarrow{\beta}^{-} \vdash [\widehat{\sigma}_0] P_0 \geqslant Q$. To do that, we notice that

 $[\widehat{\sigma}_0] P_0 = [\widehat{\sigma}] [\sigma] [\overrightarrow{\alpha}^2/\widehat{\alpha}^2] P_0$: let us consider an arbitrary variable appearing freely in P_0 :

- (1) if this variable is a algorithmic variable $\widehat{\alpha}_i^- \in \widehat{\alpha}^-$, then $[\widehat{\sigma}_0]\widehat{\alpha}_i^- = [\sigma]\alpha_i^-$ and $[\widehat{\sigma}][\sigma][\overrightarrow{\alpha}^-/\widehat{\alpha}^-]\widehat{\alpha}_i^- = [\widehat{\sigma}][\sigma]\alpha_i^- = [\sigma]\alpha_i^-$,
- (2) if this variable is a algorithmic variable $\widehat{\beta}^{\pm} \in \mathbf{uv}(\underline{P}_0) \setminus \overrightarrow{\widehat{\alpha}} = \mathbf{uv}(\underline{P}')$, then $[\widehat{\sigma}_0]\widehat{\beta}^{\pm} = [\widehat{\sigma}]\widehat{\beta}^{\pm}$ and $[\widehat{\sigma}][\sigma][\overrightarrow{\alpha}^{\pm}/\widehat{\alpha}]\widehat{\beta}^{\pm} = [\widehat{\sigma}][\sigma]\widehat{\beta}^{\pm} = [\widehat{\sigma}]\widehat{\beta}^{\pm}$,
- (3) if this variable is a regular variable from $\mathbf{fv}(\underline{P}_0)$, both substitutions do not change it: $\widehat{\sigma}_0$, $\widehat{\sigma}$ and $\overrightarrow{\alpha}$ / $\widehat{\alpha}$ act on algorithmic variables, and σ is defined on $\overrightarrow{\alpha}$, however, $\overrightarrow{\alpha}$ \cap $\mathbf{fv}(\underline{P}_0) = \emptyset$.

This way, $[\widehat{\sigma}_0] P_0 = [\widehat{\sigma}] [\sigma] [\overrightarrow{\alpha}^+/\overrightarrow{\widehat{\alpha}}^-] P_0 = [\widehat{\sigma}] [\sigma] P'$, and thus, $T, \overrightarrow{\beta}^+ \vdash [\widehat{\sigma}_0] P_0 \geqslant Q'$.

9.12 Subtyping Constraint Merge

Observation 11 (Constraint Entry Merge is Deterministic). For fixed T, e_1 , e_2 , if $T \vdash e_1 \& e_2 = e$ and $T \vdash e_1 \& e_2 = e'$ then e = e'.

PROOF. First, notice that the shape of e_1 and e_2 uniquely determines the rule applied to infer $T \vdash e_1 \& e_2 = e$, which is consequently, the same rule used to infer $T \vdash e_1 \& e_2 = e'$. Second, notice that the premises of each rule are deterministic on the input: the positive subtyping is deterministic by observation 10, and the least upper bound is deterministic by observation 7.

Observation 12 (Subtyping Constraint Merge is Deterministic). Suppose that $\Sigma \vdash C_1$ and $\Sigma \vdash C_2$ If $\Sigma \vdash C_1 \& C_2 = C$ and $\Sigma \vdash C_1 \& C_2 = C'$ are defined then C = C'.

PROOF. The proof is analogous to the proof of observation 3 but uses observation 11 to show that the merge of the matching constraint entries is fixed.

Lemma 80 (Soundness of Constraint Entry Merge). For a fixed context T, suppose that $T \vdash e_1$ and $T \vdash e_2$. If $T \vdash e_1 \& e_2 = e$ is defined then

(1) $T \vdash e$

4654 4655 (2) For any $T \vdash P$, $T \vdash P$: e implies $T \vdash P$: e_1 and $T \vdash P$: e_2

PROOF. Let us consider the rule forming $T \vdash e_1 \& e_2 = e$.

Case 1. $(\simeq \&^+ \simeq)$, i.e. $T \vdash e_1 \& e_2 = e$ has form $T \vdash (\widehat{\alpha}^+ :\simeq Q) \& (\widehat{\alpha}^+ :\simeq Q') = (\widehat{\alpha}^+ :\simeq Q)$ and $\operatorname{nf}(Q) = \operatorname{nf}(Q')$. The latter implies $T \vdash Q \simeq^{\leqslant} Q'$ by lemma 46. Then

- (1) $T \vdash e$, i.e. $T \vdash \widehat{\alpha}^+ :\simeq Q$ holds by assumption;
- (2) by inversion, $T \vdash P : (\widehat{\alpha}^+ :\simeq Q)$ means $T \vdash P \simeq^{\leq} Q$, and by transitivity of equivalence (corollary 10), $T \vdash P \simeq^{\leq} Q'$. Thus, $T \vdash P : e_1$ and $T \vdash P : e_2$ hold by $(:\cong^{SAT}_+)$.

Case 2. $(\simeq \&^- \simeq)$ the negative case is proved in exactly the same way as the positive one.

Case 3. ($\geqslant \&^+ \geqslant$) Then e_1 is $\widehat{\alpha}^+ : \geqslant Q_1$, e_2 is $\widehat{\alpha}^+ : \geqslant Q_2$, and $e_1 \& e_2 = e$ is $\widehat{\alpha}^+ : \geqslant Q$ where Q is the least upper bound of Q_1 and Q_2 . Then by lemma 72,

- $T \vdash Q$,
- $T \vdash Q \geqslant Q_1$,
- $T \vdash O \geqslant O_2$

Vol. 1, No. 1, Article Publication date: November 2023.

П

Let us show the required properties.

• $T \vdash e$ holds from $T \vdash Q$,

• Assuming $T \vdash P : e$, by inversion, we have $T \vdash P \geqslant Q$. Combining it transitively with $T \vdash Q \geqslant Q_1$, we have $T \vdash P \geqslant Q_1$. Analogously, $T \vdash P \geqslant Q_2$. Then $T \vdash P : e_1$ and $T \vdash P : e_2$ hold by $(:\geqslant_+^{SAT})$.

Case 4. ($\geqslant \&^+ \simeq$) Then e_1 is $\widehat{\alpha}^+ : \geqslant Q_1$, e_2 is $\widehat{\alpha}^+ : \simeq Q_2$, where $T; \cdot \models Q_2 \geqslant Q_1 \dashv \cdot$, and the resulting $e_1 \& e_2 = e$ is equal to e_2 , that is $\widehat{\alpha}^+ : \simeq Q_2$.

Let us show the required properties.

- By assumption, $T \vdash Q$, and hence $T \vdash e$.
- Since $uv(Q_2) = \emptyset$, $T_1 : \vdash Q_2 \geqslant Q_1 = 0$ implies $T \vdash Q_2 \geqslant Q_1$ by the soundness of positive subtyping (lemma 78). Then let us take an arbitrary $T \vdash P$ such that $T \vdash P : e$. Since $e_2 = e$, $T \vdash P : e_2$ holds immediately.

By inversion, $T \vdash P : (\widehat{\alpha}^+ :\simeq Q_2)$ means $T \vdash P \simeq^{\leq} Q_2$, and then by transitivity of subtyping (lemma 22), $T \vdash P \geqslant Q_1$. Then $T \vdash P : e_1$ holds by $(:\geqslant_{+}^{SAT})$.

Case 5. ($\simeq \&^+ \geqslant$) Thee proof is analogous to the previous case.

Lemma 81 (Soundness of Constraint Merge). Suppose that $\Sigma \vdash C_1 : \Upsilon_1$ and $\Sigma \vdash C_2 : \Upsilon_2$ and $\Sigma \vdash C_1 \& C_2 = C$ is defined. Then

- (1) $\Sigma \vdash C : \Upsilon_1 \cup \Upsilon_2$,
- (2) for any substitution $\Sigma \vdash \widehat{\sigma} : \Upsilon_1 \cup \Upsilon_2, \Sigma \vdash \widehat{\sigma} : C \text{ implies } \Sigma \vdash \widehat{\sigma} : C_1 \text{ and } \Sigma \vdash \widehat{\sigma} : C_2.$

PROOF. By definition, $\Sigma \vdash C_1 \& C_2 = C$ consists of three parts: entries of C_1 that do not have matching entries of C_2 , entries of C_2 that do not have matching entries of C_1 , and the merge of matching entries.

Notice that $\widehat{\alpha}^{\pm} \in \Upsilon_1 \setminus \Upsilon_2$ if and only if there is an entry e in C_1 restricting $\widehat{\alpha}^{\pm}$, but there is no such entry in C_2 . Therefore, for any $\widehat{\alpha}^{\pm} \in \Upsilon_1 \setminus \Upsilon_2$, there is an entry e in C restricting $\widehat{\alpha}^{\pm}$. Notice that $\Sigma(\widehat{\alpha}^{\pm}) \vdash e$ holds since $\Sigma \vdash C_1 : \Upsilon_1$.

Analogously, for any $\widehat{\beta}^{\pm} \in \Upsilon_2 \setminus \Upsilon_1$, there is an entry e in C restricting $\widehat{\beta}^{\pm}$. Notice that $\Sigma(\widehat{\beta}^{\pm}) \vdash e$ holds since $\Sigma \vdash C_2 : \Upsilon_2$.

Finally, for any $\widehat{\gamma}^{\pm} \in \Upsilon_1 \cap \Upsilon_2$, there is an entry e_1 in C_1 restricting $\widehat{\gamma}^{\pm}$ and an entry e_2 in C_2 restricting $\widehat{\gamma}^{\pm}$. Since $\Sigma \vdash C_1 \& C_2 = C$ is defined, $\Sigma(\widehat{\gamma}^{\pm}) \vdash e_1 \& e_2 = e$ restricting $\widehat{\gamma}^{\pm}$ is defined and belongs to C, moreover, $\Sigma(\widehat{\gamma}^{\pm}) \vdash e$ by lemma 80. This way, $\Sigma \vdash C : \Upsilon_1 \cup \Upsilon_2$.

Let us show the second property. We take an arbitrary $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : \Upsilon_1 \cup \Upsilon_2$ and $\Sigma \vdash \widehat{\sigma} : C$ To prove $\Sigma \vdash \widehat{\sigma} : C_1$, we need to show that for any $e_1 \in C_1$, restricting $\widehat{\alpha}^{\pm}$, $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : e_1$ holds Let us assume that $\widehat{\alpha}^{\pm} \notin \operatorname{dom}(C_2)$. It means that $C \ni e_1$, and then since $\Sigma \vdash \widehat{\sigma} : C$, $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : e_1$.

Otherwise, C_2 contains an entry e_2 restricting $\widehat{\alpha}^{\pm}$, and $C \ni e$ where $\Sigma(\widehat{\alpha}^{\pm}) \vdash e_1 \& e_2 = e$. Then since $\Sigma \vdash \widehat{\sigma} : C$, $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm} : e$, and by lemma 80, $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm} : e_1$.

The proof of $\Sigma \vdash \widehat{\sigma} : C_2$ is symmetric.

Lemma 82 (Completeness of Constraint Entry Merge). For a fixed context T, suppose that $T \vdash e_1$ and $T \vdash e_2$ are matching constraint entries.

- for a type P such that $T \vdash P : e_1$ and $T \vdash P : e_2$, $T \vdash e_1 \& e_2 = e$ is defined and $T \vdash P : e$.
- for a type N such that $T \vdash N : e_1$ and $T \vdash N : e_2$, $T \vdash e_1 \& e_2 = e$ is defined and $T \vdash N : e$.

PROOF. Let us consider the shape of e_1 and e_2 .

Case 1. e_1 is $\widehat{\alpha}^+ :\simeq O_1$ and e_2 is $\widehat{\alpha}^+ :\simeq O_2$. The proof repeats the corresponding case of lemma 62

Case 2. e_1 is $\widehat{\alpha}^+ := Q_1$ and e_2 is $\widehat{\alpha}^+ := Q_2$. Then $T \vdash P : e_1$ means $T \vdash P : e_2$ means $T \vdash P \geqslant Q_2$. Then by transitivity of subtyping, $T \vdash Q_1 \geqslant Q_2$, which means T; $\cdot \models Q_1 \geqslant Q_2 \dashv \cdot$ by lemma 79. This way, $(\simeq \&^+ \geqslant)$ applies to infer $T \vdash e_1 \& e_2 = e_1$, and $T \vdash P : e_1$ holds by assumption.

Case 3. e_1 is $\widehat{\alpha}^+ : \ge Q_1$ and e_2 is $\widehat{\alpha}^+ : \ge Q_2$. Then $T \vdash P : e_1$ means $T \vdash P \ge Q_1$, and $T \vdash P : e_2$ means $T \vdash P \geqslant Q_2$. By the completeness of the least upper bound (lemma 73), $T \models Q_1 \lor Q_2 = Q$, and $T \vdash P \geqslant Q$. This way, $(\geqslant \&^+ \geqslant)$ applies to infer $T \vdash e_1 \& e_2 = (\widehat{\alpha}^+ : \geqslant Q)$, and $T \vdash P : (\widehat{\alpha}^+ : \geqslant Q)$ holds by $(:\geqslant^{SAT}_+)$.

Case 4. The negative cases are proved symmetrically.

Lemma 83 (Completeness of Constraint Merge). Suppose that $\Sigma \vdash C_1 : \Upsilon_1$ and $\Sigma \vdash C_2 : \Upsilon_2$. If there exists a substitution $\Sigma \vdash \widehat{\sigma} : \Upsilon_1 \cup \Upsilon_2$ such that $\Sigma \vdash \widehat{\sigma} : C_1$ and $\Sigma \vdash \widehat{\sigma} : C_2$ then $\Sigma \vdash C_1 \& C_2 = C$ is defined.

PROOF. By definition, $C_1 \& C_2$ is a union of

- (1) entries of C_1 , which do not have matching entries in C_2 ,
- (2) entries of C_2 , which do not have matching entries in C_1 , and
- (3) the merge of matching entries.

This way, to show that $\Sigma \vdash C_1 \& C_2 = C$ is defined, we need to demonstrate that each of these components is defined and satisfies the required property (that the result of $\widehat{\sigma}$ satisfies the corresponding constraint entry).

It is clear that the first two components of this union exist. Moreover, if e is an entry of C_i restricting $\widehat{\alpha}^{\pm} \notin \mathbf{dom}(C_2)$, then $\Sigma \vdash \widehat{\sigma} : C_i$ implies $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : e$,

Let us show that the third component exists. Let us take two entries $e_1 \in C_1$ and $e_2 \in C_2$ restricting the same variable $\widehat{\alpha}^{\pm}$. $\Sigma \vdash \widehat{\sigma} : C_1$ means that $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm} : e_1$ and $\Sigma \vdash \widehat{\sigma} : C_2$ means $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : e_2$. Then by lemma 82, $\Sigma(\widehat{\alpha}^{\pm}) \vdash e_1 \& e_2 = e$ is defined and $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : e$.

9.13 Negative Subtyping

Observation 13 (Negative Algorithmic Subtyping is Deterministic). For fixed T, Σ, M , and N, if $T; \Sigma \models \mathbb{N} \leq M \dashv C \text{ and } T; \Sigma \models \mathbb{N} \leq M \dashv C' \text{ then } C = C'.$

PROOF. First, notice that the shape of the input uniquely determines the rule applied to infer $T; \Sigma \models N \leqslant M \dashv C$, which is consequently, the same rule used to infer $T; \Sigma \models N \leqslant M \dashv C'$.

Second, notice that for each of the inference rules, the premises are deterministic on the input Specifically,

- (\uparrow^{\leq}) relies on unification, which is deterministic by observation 4;
- (∀[≤]) relies on the choice of fresh algorithmic variables, which is deterministic as discussed in section 2.2, and on the negative subtyping, which is deterministic by the induction hypothesis;
- (\rightarrow^{\leq}) uses the negative subtyping (deterministic by the induction hypothesis), the positive subtyping (observation 10), and the merge of subtyping constraints (observation 12);

Lemma 84 (Soundness of Negative Subtyping). If $T \vdash^{\supseteq} \Sigma, T \vdash M, T$; $dom(\Sigma) \vdash N$ and $T; \Sigma \vdash$ $N \leq M = C$, then $\Sigma \vdash C : \mathbf{uv}(N)$ and for any normalized $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : C, T \vdash [\widehat{\sigma}] N \leq M$.

PROOF. We prove it by induction on T; $\Sigma \models N \leq M \dashv C$.

Suppose that $\widehat{\sigma}$ is normalized and $\Sigma \vdash \widehat{\sigma} : C$, Let us consider the last rule to infer this judgment.

Vol. 1, No. 1, Article Publication date: November 2023.

Case 1. (\rightarrow^{\leq}) . Then T; $\Sigma \models \mathbb{N} \leq M \dashv C$ has shape T; $\Sigma \models \mathbb{P} \to \mathbb{N}' \leq \mathbb{Q} \to M' \dashv C$ On the next step, the the algorithm makes two recursive calls: T; $\Sigma \models \mathbb{P} \geqslant \mathbb{Q} \dashv C_1$ and

 $T; \Sigma \models N' \leq M' \dashv C_2$ and returns $\Sigma \vdash C_1 \& C_2 = C$ as the result.

By the soundness of constraint merge (lemma 81), $\Sigma \vdash \widehat{\sigma} : C_1$ and $\Sigma \vdash \widehat{\sigma} : C_2$. Then by the soundness of positive subtyping (lemma 78), $T \vdash [\widehat{\sigma}] P \geqslant Q$; and by the induction hypothesis, $T \vdash [\widehat{\sigma}] N' \leqslant M'$. This way, by $(\rightarrow^{\leqslant}), T \vdash [\widehat{\sigma}] (P \rightarrow N') \leqslant Q \rightarrow M'$.

Case 2. (VAR $^{\leq}$), and then T; $\Sigma \models N \leqslant M \dashv C$ has shape T; $\Sigma \models \alpha^- \leqslant \alpha^- \dashv \cdot$ This case is symmetric to case 2 of lemma 78.

Case 3. (\uparrow^{\leq}), and then T; $\Sigma \models \mathbb{N} \leq M \dashv C$ has shape T; $\Sigma \models \uparrow \mathbb{P} \leq \uparrow \mathbb{Q} \dashv C$ This case is symmetric to case 3 of lemma 78.

Case 4. (\forall^{\leq}) , and then T; $\Sigma \models \mathbb{N} \leq M = C$ has shape T; $\Sigma \models \forall \overrightarrow{\alpha^+}$. $\mathbb{N}' \leq \forall \overrightarrow{\beta^+}$. M' = C s.t. either $\overrightarrow{\alpha^+}$ or $\overrightarrow{\beta^+}$ is not empty

This case is symmetric to case 4 of lemma 78.

Lemma 85 (Completeness of the Negative Subtyping). Suppose that $T \vdash^{\supseteq} \Sigma, T \vdash M, T; \mathbf{dom}(\Sigma) \vdash N$, and N does not contain negative unification variables $(\widehat{\alpha}^{-} \notin \mathbf{uv} \ N)$. Then for any $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(N)$ such that $T \vdash [\widehat{\sigma}] N \leqslant M$, there exists $T; \Sigma \vdash N \leqslant M \rightrightarrows C$ and moreover, $\Sigma \vdash \widehat{\sigma} : C$.

PROOF. We prove it by induction on $T \vdash [\widehat{\sigma}] N \leq M$. Let us consider the last rule used in the derivation of $T \vdash [\widehat{\sigma}] N \leq M$.

Case 1. $T \vdash [\widehat{\sigma}] N \leq M$ is derived by (\uparrow^{\leq})

Then $N = \uparrow P$, since the substitution $[\widehat{\sigma}] N$ must preserve the top-level constructor of $N \neq \widehat{\alpha}^-$ (since by assumption, $\widehat{\alpha}^- \notin \mathbf{uv} N$), and $Q = \downarrow M$, and by inversion, $T \vdash [\widehat{\sigma}] N \simeq^{\leqslant} M$. The rest of the proof is symmetric to case 3 of lemma 79: notice that the algorithm does not make a recursive call, and the difference in the induction statement for the positive and the negative case here does not matter.

Case 2. $T \vdash [\widehat{\sigma}] N \leq M$ is derived by (\to^{\leq}) , i.e. $[\widehat{\sigma}] N = [\widehat{\sigma}] P \to [\widehat{\sigma}] N'$ and $M = Q \to M'$ and by inversion, $T \vdash [\widehat{\sigma}] P \geqslant Q$ and $T \vdash [\widehat{\sigma}] N' \leq M'$.

The algorithm makes two recursive calls: T; $\Sigma \models \mathbb{P} \geqslant Q \dashv C_1$ and T; $\Sigma \models \mathbb{N}' \leqslant \mathbb{M}' \dashv C_2$, and then returns $\Sigma \vdash C_1 \& C_2 = C$ as the result. Let us show that these recursive calls are successful and the returning constraints are fulfilled by $\widehat{\sigma}$.

Notice that from the inversion of $T \vdash M$, we have: $T \vdash Q$ and $T \vdash M'$; from the inversion of T; $\operatorname{dom}(\Sigma) \vdash N$, we have: T; $\operatorname{dom}(\Sigma) \vdash P$ and T; $\operatorname{dom}(\Sigma) \vdash N'$; and since N does not contain negative unification variables, N' does not contain negative unification variables either.

This way, we can apply the induction hypothesis to $T \vdash [\widehat{\sigma}] \mathbb{N}' \leq M'$ to obtain T; $\Sigma \models \mathbb{N}' \leq M' \dashv C_2$ such that $\Sigma \vdash C_2 : \mathbf{uv}(\mathbb{N}')$ and $\Sigma \vdash \widehat{\sigma} : C_2$. Also, we can apply the completeness of the positive subtyping (lemma 79) to $T \vdash [\widehat{\sigma}] \mathbb{P} \geqslant Q$ to obtain T; $\Sigma \models \mathbb{P} \geqslant Q \dashv C_1$ such that $\Sigma \vdash C_1 : \mathbf{uv}(\mathbb{P})$ and $\Sigma \vdash \widehat{\sigma} : C_1$.

Finally, we need to show that the merge of C_1 and C_2 is successful and satisfies the required properties. To do so, we apply the completeness of subtyping constraint merge (lemma 83) (notice that $\Sigma \vdash \widehat{\sigma} : \mathbf{uv} \ (P \to N')$ means $\Sigma \vdash \widehat{\sigma} : \mathbf{uv} \ (P) \cup \mathbf{uv} \ (N')$). This way, $\Sigma \vdash C_1 \& C_2 = C$ is defined and $\Sigma \vdash \widehat{\sigma} : C$ holds.

Case 3. $T + [\widehat{\sigma}] N \le M$ is derived by (\forall^{\leq}) . Since N does not contain negative unification variables, N must be of the form $\forall \alpha^{+}$. N', such that $[\widehat{\sigma}] N = \forall \alpha^{+}$. $[\widehat{\sigma}] N'$ and $[\widehat{\sigma}] N' \ne \forall \dots$ (assuming α^{+} does not intersect with the range of $\widehat{\sigma}$). Also, $M = \forall \beta^{+}$. M' and either α^{+} or β^{+} is non-empty.

The rest of the proof is symmetric to case 4 of lemma 79. To apply the induction hypothesis, we need to show additionally that there are no negative unification variables in $N_0 = [\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+]N'$. This is because $\mathbf{uv} \ N_0 \subseteq \mathbf{uv} \ N \cup \overrightarrow{\alpha}^+$, and N is free of negative unification variables by assumption.

Case 4. $T \vdash [\widehat{\sigma}] N \leq M$ is derived by (VAR^{\leq}) .

4848

4850 4851 Then $N = [\widehat{\sigma}] N = \alpha^- = M$. Here the first equality holds because N is not a unification variable: by assumption, N is free of negative unification variables. The second and the third equations hold because (VAR \leq) was applied.

The rest of the proof is symmetric to case 2 of lemma 79.

10 PROPERTIES OF THE DECLARATIVE TYPING

Definition 30 (Number of prenex quantifiers). Let us define npq(N) and npq(P) as the number of prenex quantifiers in these types, i.e.

```
+ npq(\exists \overrightarrow{\alpha}^{-}. \overrightarrow{P}) = |\overrightarrow{\alpha}^{-}|, if \overrightarrow{P} \neq \exists \overrightarrow{\beta}^{-}. \overrightarrow{P}', - npq(\forall \overrightarrow{\alpha}^{+}. N) = |\overrightarrow{\alpha}^{+}|, if N \neq \forall \overrightarrow{\beta}^{+}. N'.
```

Definition 31 (Size of a Declarative Judgement). For a declarative typing judgment J let us define a metrics size(J) as a pair of numbers in the following way:

```
+ size(T; \Gamma \vdash \nu : P) = (\text{size}(\nu), 0);
- size(T; \Gamma \vdash c : N) = (\text{size}(c), 0);
```

• $\operatorname{size}(T; \Gamma \vdash N \bullet \overrightarrow{v} \Longrightarrow M) = (\operatorname{size}(\overrightarrow{v}), \operatorname{npq}(N)))$

where size(v) or size(c) is the size of the syntax tree of the term v or c and $size(\overrightarrow{v})$ is the sum of sizes of the terms in \overrightarrow{v} .

Definition 32 (Number of Equivalence Nodes). For a tree T inferring a declarative typing judgment, let us a function eq_nodes(T) as the number of nodes in T labeled with (\simeq_+^{INF}) or (\simeq_-^{INF}).

Definition 33 (Metric). For a tree T inferring a declarative typing judgment J, let us define a metric metric T as a pair (size T), eq_nodes T).

```
Lemma 49. If T : \Gamma \vdash N_1 \bullet \overrightarrow{v} \implies M and T \vdash N_1 \simeq^{\leqslant} N_2 then T : \Gamma \vdash N_2 \bullet \overrightarrow{v} \implies M.
```

PROOF. By lemma 32, $T \vdash N_1 \simeq^{\leq} N_2$ implies $N_1 \simeq^D N_2$. Let us prove the required judgement by induction on $N_1 \simeq^D N_2$. Let us consider the last rule used in the derivation.

Case 1. (VAR $^{\simeq D}_{-}$). It means that N_1 is α^- and N_2 is α^- . Then the required property coincides with the assumption.

```
Case 2. (\uparrow^{\simeq^D}). It means that N_1 is \uparrow P_1 and N_2 is \uparrow P_2, where P_1 \simeq^D P_2.
 Then the only rule applicable to infer T : \Gamma \vdash \uparrow P_1 \bullet \overrightarrow{v} \implies M is (\emptyset^{\text{INF}}_{\bullet \Longrightarrow}), meaning that \overrightarrow{v} = \cdot and T \vdash \uparrow P_1 \simeq^{\leqslant} M. Then by transitivity of equivalence corollary 10, T \vdash \uparrow P_2 \simeq^{\leqslant} M, and then (\emptyset^{\text{INF}}_{\bullet \Longrightarrow}) is applicable to infer T : \Gamma \vdash \uparrow P_2 \bullet \cdot \Longrightarrow M.
```

```
Case 3. (\rightarrow^{\stackrel{\frown}{=}}). Then we are proving that T : \Gamma \vdash (Q_1 \rightarrow N_1) \bullet \nu, \overrightarrow{v} \implies M and Q_1 \rightarrow N_1 \cong^D

Q_2 \rightarrow N_2 imply T : \Gamma \vdash (Q_2 \rightarrow N_2) \bullet \nu, \overrightarrow{v} \implies M.
```

By inversion, $(Q_1 \to N_1) \simeq^D (Q_2 \to N_2)$ means $Q_1 \simeq^D Q_2$ and $N_1 \simeq^D N_2$.

By inversion of $T : \Gamma \vdash (Q_1 \rightarrow N_1) \bullet \nu, \overrightarrow{v} \implies M$:

- (1) $T; \Gamma \vdash \nu : P$
- (2) $T \vdash Q_1 \geqslant P$, and then by transitivity lemma 22, $T \vdash Q_2 \geqslant P$;
- (3) $T: \Gamma \vdash N_1 \bullet \overrightarrow{v} \implies M$, and then by induction hypothesis, $T: \Gamma \vdash N_2 \bullet \overrightarrow{v} \implies M$.

Vol. 1. No. 1. Article - Publication date: November 2023.

Since we have $T; \Gamma \vdash v : P, T \vdash Q_2 \geqslant P$ and $T; \Gamma \vdash N_2 \bullet \overrightarrow{v} \implies M$, we can apply $(\rightarrow_{\bullet \Longrightarrow}^{\text{INF}})$ to infer $T; \Gamma \vdash (Q_2 \rightarrow N_2) \bullet v, \overrightarrow{v} \implies M$.

Case 4. (\forall^{\cong^D}) Then we are proving that $T; \Gamma \vdash \forall \alpha^+_1 . N_1' \bullet \overrightarrow{v} \implies M$ and $\forall \alpha^+_1 . N_1' \simeq^D \forall \alpha^+_2 . N_2'$ imply $T; \Gamma \vdash \forall \alpha^+_2 . N_2' \bullet \overrightarrow{v} \implies M$.

By inversion of $\forall \overrightarrow{\alpha}^{+}_{1}$. $N'_{1} \simeq^{D} \forall \overrightarrow{\alpha}^{+}_{2}$. N'_{2} :

- (1) $\overrightarrow{\alpha}^+_2 \cap \text{fv } N_1 = \emptyset$,
- (2) there exists a bijection $\mu: (\overrightarrow{\alpha^+}_2 \cap \mathbf{fv} \, N_2') \leftrightarrow (\overrightarrow{\alpha^+}_1 \cap \mathbf{fv} \, N_1')$ such that $N_1' \simeq^D [\mu] N_2'$. By inversion of $T : \Gamma \vdash \forall \overrightarrow{\alpha^+}_1 . N_1' \bullet \overrightarrow{v} \implies M$:
- (1) $T \vdash \sigma : \overrightarrow{\alpha^+}_1$
- (2) $T : \Gamma \vdash [\sigma] N'_1 \bullet \overrightarrow{v} \Longrightarrow M$
- (3) $\overrightarrow{v} \neq$

Let us construct $T \vdash \sigma_0 : \overrightarrow{\alpha}^{\dagger}_2$ in the following way:

$$\begin{cases} [\sigma_0]\alpha^+ = [\sigma][\mu]\alpha^+ & \text{if } \alpha^+ \in \overrightarrow{\alpha^+}_2 \cap \text{fv } N_2' \\ [\sigma_0]\alpha^+ = \exists \beta^-. \downarrow \beta^- & \text{otherwise (the type does not matter here)} \end{cases}$$

Then to infer T; $\Gamma \vdash N_2 \bullet \overrightarrow{v} \implies M$, we apply $(\rightarrow_{\bullet \Longrightarrow}^{\text{INF}})$ with σ_0 . Let us show the required premises:

- (1) $T \vdash \sigma_0 : \overrightarrow{\alpha}^+_2$ by construction;
- (2) $\overrightarrow{v} \neq \cdot$ as noted above;
- (3) To show $T; \Gamma \vdash [\sigma_0] N_2' \bullet \overrightarrow{v} \implies M$, Notice that $[\sigma_0] N_2' = [\sigma] [\mu] N_2'$ and since $[\mu] N_2' \simeq^D N_1'$, $[\sigma] [\mu] N_2' \simeq^D [\sigma] N_1'$. This way, by lemma 27, $T \vdash [\sigma] N_1' \simeq^{\varsigma} [\sigma_0] N_2'$. Then the required judgement holds by the induction hypothesis applied to $T; \Gamma \vdash [\sigma] N_1' \bullet \overrightarrow{v} \implies M$.

Lemma 48 (Declarative typing is preserved under context equivalence). Assuming $T \vdash \Gamma_1$, $T \vdash \Gamma_2$, and $T \vdash \Gamma_1 \simeq^{\leq} \Gamma_2$:

- + for any tree T_1 inferring $T; \Gamma_1 \vdash \nu : P$, there exists a tree T_2 inferring $T; \Gamma_2 \vdash \nu : P$.
- for any tree T_1 inferring $T; \Gamma_1 \vdash c : N$, there exists a tree T_2 inferring $T; \Gamma_2 \vdash c : N$.
- for any tree T_1 inferring $T: \Gamma_1 \vdash N \bullet \overrightarrow{v} \implies M$, there exists a tree T_2 inferring $T: \Gamma_2 \vdash N \bullet \overrightarrow{v} \implies M$

PROOF. Let us prove it by induction on the metric (T_1) . Let us consider the last rule applied in T_1 (i.e., its root node).

Case 1. (VAR^{INF})

Then we are proving that T; $\Gamma_1 \vdash x : P$ implies T; $\Gamma_2 \vdash x : P$. By inversion, $x : P \in \Gamma_1$, and since $T \vdash \Gamma_1 \simeq^{\leq} \Gamma_2$, $x : P' \in \Gamma_2$ for some P' such that $T \vdash P \simeq^{\leq} P'$. Then we infer T; $\Gamma_2 \vdash x : P'$ by (VAR^{INF}) , and next, T; $\Gamma_2 \vdash x : P$ by (\cong^{INF}_+) .

Case 2. For $(\{\}^{\text{INF}})$, $(\text{ANN}_{+}^{\text{INF}})$, (Λ^{INF}) , $(\text{RET}^{\text{INF}})$, and $(\text{ANN}_{-}^{\text{INF}})$ the proof is analogous. We apply the induction hypothesis to the premise of the rule to substitute Γ_1 for Γ_2 in it. The induction is applicable because the metric of the premises is less than the metric of the conclusion the term in the premise is a syntactic subterm of the term in the conclusion.

And after that, we apply the same rule to infer the required judgement.

Case 3. (\simeq_+^{INF}) and (\simeq_-^{INF}) In these cases, the induction hypothesis is also applicable to the premise: although the first component of the metric is the same for the premise and the conclusion: $\operatorname{size}(T; \Gamma \vdash c : N') = \operatorname{size}(T; \Gamma \vdash c : N) = \operatorname{size}(c)$, the second component of the metric is less for the premise by one, since the equivalence rule was applied to turn the

premise tree into T1. Having made this note, we continue the proof in the same way as in the previous case.

Case 4. (λ^{INF}) Then we are proving that $T; \Gamma_1 \vdash \lambda x : P. c: P \to N$ implies $T; \Gamma_2 \vdash \lambda x : P. c: P \to N$. Analogously to the previous cases, we apply the induction hypothesis to the equivalent contexts $T \vdash \Gamma_1, x : P \simeq^c \Gamma_2, x : P$ and the premise $T; \Gamma_1, x : P \vdash c: N$ to obtain $T; \Gamma_2, x : P \vdash c: N$. Notice that c is a subterm of $\lambda x : P. c$, i.e., the metric of the premise tree is less than the metric of the conclusion, and the induction hypothesis is applicable. Then we infer $T; \Gamma_2 \vdash \lambda x : P. c : P \to N$ by (λ^{INF}) .

Case 5. (LET^{INF}) Then we are proving that $T; \Gamma_1 \vdash \mathbf{let} \ x = \nu; c \colon N$ implies $T; \Gamma_2 \vdash \mathbf{let} \ x = \nu; c \colon N$ First, we apply the induction hypothesis to $T; \Gamma_1 \vdash \nu \colon P$ to obtain $T; \Gamma_2 \vdash \nu \colon P$ of the same pure size.

Then we apply the induction hypothesis to the equivalent contexts $T \vdash \Gamma_1, x : P \simeq^{<} \Gamma_2, x : P$ and the premise $T; \Gamma_1, x : P \vdash c : N$ to obtain $T; \Gamma_2, x : P \vdash c : N$. Then we infer $T; \Gamma_2 \vdash \text{let } x = v ; c : N$ by (LET^{INF}).

Case 6. (LET_@^{INF}) Then we are proving that $T; \Gamma_1 \vdash \text{let } x = v(\overrightarrow{v}); c : N \text{ implies } T; \Gamma_2 \vdash \text{let } x = v(\overrightarrow{v}); c : N.$

We apply the induction hypothesis to each of the premises. to rewrite:

• T; $\Gamma_1 \vdash \nu$: $\downarrow M$ into T; $\Gamma_2 \vdash \nu$: $\downarrow M$,

- $T : \Gamma_1 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q \text{ into } T : \Gamma_2 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q.$
- T; $\Gamma_1, x : Q \vdash c : N$ into T; $\Gamma_2, x : Q \vdash c : N$ (notice that $T \vdash \Gamma_1, x : Q \simeq^{\leq} \Gamma_2, x : Q$).

It is left to show the uniqueness of T; $\Gamma_2 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$. Let us assume that this judgement holds for other Q', i.e. there exists a tree T_0 inferring T; $\Gamma_2 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q'$. Then notice that the induction hypothesis is applicable to T_0 : the first component of the first component of metric T_0 is $S = \sum_{v \in \overrightarrow{v}} \operatorname{size}(v)$, and it is less than the corresponding component of metric T_0 , which is $\operatorname{size}(\operatorname{let} x = v(\overrightarrow{v}); c) = 1 + \operatorname{size}(v) + \operatorname{size}(c) + S$. This way, $T : \Gamma_1 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q'$ holds by the induction hypothesis, but since $T : \Gamma_1 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$ unique, we have $T \vdash Q' \simeq^c Q$.

Then we infer T; $\Gamma_2 \vdash \mathbf{let} \ x = v(\overrightarrow{v}) \ ; \ c : N$ by (LET $^{\mathrm{INF}}_{\odot}$).

Case 7. (LET:_(*)^{INF}) Then we are proving that $T; \Gamma_1 \vdash \mathbf{let} \ x : P = v(\vec{v}); c : N$ implies $T; \Gamma_2 \vdash \mathbf{let} \ x = P = v(\vec{v}); c : N$.

As in the previous case, we apply the induction hypothesis to each of the premises and rewrite:

- T; $\Gamma_1 \vdash \nu$: $\downarrow M$ into T; $\Gamma_2 \vdash \nu$: $\downarrow M$,
- $T : \Gamma_1 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q \text{ into } T : \Gamma_2 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q, \text{ and } T : \Gamma_2 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$
- T; Γ_1 , $x : P \vdash c : N$ into T; Γ_2 , $x : P \vdash c : N$ (notice that $T \vdash \Gamma_1$, $x : P \simeq^{\leq} \Gamma_2$, x : P).

Notice that $T \vdash P$ and $T \vdash \uparrow Q \leq \uparrow P$ do not depend on the variable context, and hold by assumption. Then we infer $T; \Gamma_2 \vdash \mathbf{let} \ x : P = \nu(\overrightarrow{v}) \ ; c : N$ by $(\mathtt{LET}^{\mathtt{INF}}_{:@})$.

Case 8. (LET $_{\square}^{\text{INF}}$), and (ANN $_{-}^{\text{INF}}$) are proved in the same way.

Case 9. $(\emptyset_{\bullet \Longrightarrow}^{\text{INF}})$ Then we are proving that $T : \Gamma_1 \vdash N \bullet \cdot \Longrightarrow N'$ (inferred by $(\emptyset_{\bullet \Longrightarrow}^{\text{INF}})$) implies $T : \Gamma_2 \vdash N \bullet \cdot \Longrightarrow N'$.

To infer $T : \Gamma_2 \vdash N \bullet \cdot \Longrightarrow N'$, we apply $(\emptyset_{\bullet \Longrightarrow}^{\text{INF}})$, noting that $T \vdash N \cong^{\leqslant} N'$ holds by assumption **Case 10**. $(\to_{\bullet \Longrightarrow}^{\text{INF}})$ Then we are proving that $T : \Gamma_1 \vdash Q \to N \bullet v$, $\overrightarrow{v} \Longrightarrow M$ (inferred by $(\to_{\bullet \Longrightarrow}^{\text{INF}})$) implies $T : \Gamma_2 \vdash Q \to N \bullet v$, $\overrightarrow{v} \Longrightarrow M$. And uniqueness of the M in the first case implies uniqueness in the second case.

By induction, we rewrite $T; \Gamma_1 \vdash v : P$ into $T; \Gamma_2 \vdash v : P$, and $T; \Gamma_1 \vdash N \bullet \overrightarrow{v} \implies M$ into $T; \Gamma_2 \vdash N \bullet \overrightarrow{v} \implies M$. Then we infer $T; \Gamma_2 \vdash Q \rightarrow N \bullet v, \overrightarrow{v} \implies M$ by $(\rightarrow_{\bullet \implies}^{\text{INF}})$.

Vol. 1, No. 1, Article Publication date: November 2023.

Now, let us show the uniqueness. The only rule that can infer $T: \Gamma_1 \vdash Q \to N \bullet v, \overrightarrow{v} \Longrightarrow M$ is $(\to_{\bullet \Longrightarrow}^{\operatorname{INF}})$. Then by inversion, uniqueness of $T: \Gamma_1 \vdash Q \to N \bullet v, \overrightarrow{v} \Longrightarrow M$ implies uniqueness of $T: \Gamma_1 \vdash N \bullet \overrightarrow{v} \Longrightarrow M$. By the induction hypothesis, it implies the uniqueness of $T: \Gamma_2 \vdash N \bullet \overrightarrow{v} \Longrightarrow M$.

Suppose that $T : \Gamma_2 \vdash Q \to N \bullet v$, $\overrightarrow{v} \Longrightarrow M'$. By inversion, $T : \Gamma_2 \vdash N \bullet \overrightarrow{v} \Longrightarrow M'$, which by uniqueness of $T : \Gamma_2 \vdash N \bullet \overrightarrow{v} \Longrightarrow M$ implies $T \vdash M \simeq^{\leq} M'$.

Case 11. $(\forall_{\bullet \Rightarrow}^{\text{INF}})$ Then we are proving that $T : \Gamma_1 \vdash \forall \overrightarrow{\alpha^+} . N \bullet \overrightarrow{v} \implies M$ (inferred by $(\forall_{\bullet \Rightarrow}^{\text{INF}})$) implies $T : \Gamma_2 \vdash \forall \overrightarrow{\alpha^+} . N \bullet \overrightarrow{v} \implies M$.

By inversion, we have σ such that $T \vdash \sigma : \overrightarrow{\alpha^+}$ and $T : \Gamma_1 \vdash [\sigma] N \bullet \overrightarrow{v} \implies M$ is inferred. Let us denote the inference tree as T_1' . Notice that the induction hypothesis is applicable to T_1' metric $(T_1') = ((\operatorname{size}(\overrightarrow{v}), 0), x)$ is less than $\operatorname{metric}(T_1) = ((\operatorname{size}(\overrightarrow{v}), |\overrightarrow{\alpha^+}|), y)$ for any x and y, since $|\overrightarrow{\alpha^+}| > 0$ by inversion.

This way, by the induction hypothesis, there exists a tree T_2' inferring $T : \Gamma_2 \vdash [\sigma] N \bullet \overrightarrow{v} \implies M$ Notice that the premises $\overrightarrow{v} \neq \cdot, T \vdash \sigma : \overrightarrow{\alpha^+}$, and $\overrightarrow{\alpha^+} \neq \cdot$ do not depend on the variable context, and hold by inversion. Then we infer $T : \Gamma_2 \vdash \forall \overrightarrow{\alpha^+}, N \bullet \overrightarrow{v} \implies M$ by (\forall^{INF}) .

11 PROPERTIES OF THE ALGORITHMIC TYPING

11.1 Singularity

Lemma 86 (Soundness of Entry Singularity).

- + Suppose e singular with P for P well-formed in T. Then $T \vdash P' : e$ and for any $T \vdash P'$ such that $T \vdash P' : e$, $T \vdash P' \simeq^{\leq} P$;
- Suppose e singular with N for N well-formed in T. Then $T \vdash N : e$ and for any $T \vdash N'$ such that $T \vdash N' : e$, $T \vdash N' \simeq^{\leq} N$.

PROOF. Let us consider how e singular with P or e singular with N is formed.

Case 1. (\simeq_{-}^{SING}), that is $e = \widehat{\alpha}^- :\simeq N_0$. and N is **nf** (N_0) . Then $T \vdash N' : e$ means $T \vdash N' \simeq^{\leqslant} N_0$, (by inversion of $(:\simeq_{-}^{\text{SAT}})$), which by transitivity, using corollary 16, means $T \vdash N' \simeq^{\leqslant} \mathbf{nf}$ (N_0) , as required.

Case 2. (\simeq_{\perp}^{SING}). This case is symmetric to the previous one.

Case 3. (:> α^{SING}), that is $e = \widehat{\alpha}^+ :> \exists \overline{\alpha}^-$. β^+ , and $P = \beta^+$.

Since $T + \beta^+ \geqslant \exists \overrightarrow{\alpha}^-$. β^+ , we have $T + \beta^+ : e$, as required.

Notice that $T \vdash P' : e$ means $T \vdash P' \ge \exists \overrightarrow{\alpha}^-$. β^+ . Let us show that it implies $T \vdash P' \simeq \beta^+$ By applying lemma 69 once, we have $T, \overrightarrow{\alpha}^- \vdash P' \ge \beta^+$. By applying it again, we notice that $T, \overrightarrow{\alpha}^- \vdash P' \ge \beta^+$ implies $P_i = \exists \overrightarrow{\alpha}^-$. β^+ . Finally, it is easy to see that $T \vdash \exists \overrightarrow{\alpha}^-$. $\beta^+ \simeq \beta^+$

Case 4. (: $\geqslant\downarrow^{\text{SING}}$), that is $e = \widehat{\alpha}^+ : \geqslant \exists \widehat{\beta}^-$. $\downarrow N_1$, where $N_1 \simeq^D \beta_j^-$, and $P = \exists \alpha^-$. $\downarrow \alpha^-$. Since $T \vdash \exists \alpha^-$. $\downarrow \alpha^- \geqslant \exists \widehat{\beta}^+$. $\downarrow N_1$ (by ($\exists \geq 0$), with substitution N_1/α^-), we have $T \vdash \exists \alpha^-$. $\downarrow \alpha^-$ e, as required.

Notice $T \vdash P' : e$ means $T \vdash P' \ge \exists \overrightarrow{\beta}^-$. $\downarrow N_1$. Let us show that it implies $T \vdash P' \simeq \exists \alpha^-$. $\downarrow \alpha^-$

```
T \vdash \mathbf{P}' \geqslant \exists \overline{\beta}^{-}. \downarrow N_1 \Rightarrow T \vdash \mathbf{nf}(\mathbf{P}') \geqslant \exists \overline{\beta}^{-}'. \downarrow \mathbf{nf}(N_1)
                                                     (where ord \overrightarrow{\beta}^- in N' = \overrightarrow{\beta}^{-\prime})
                                                                                                                                            by corollary 17
                                                  \Rightarrow T \vdash \mathbf{nf}(\underline{P}') \geqslant \exists \overrightarrow{\beta}^{-1}' . \ \ \ \ \ \mathbf{nf}(\underline{\beta}^{-1})
                                                                                                                                           by lemma 42
                                                 \Rightarrow T \vdash \mathbf{nf}(\underline{P}') \geqslant \exists \overrightarrow{\beta}^{-1} . \downarrow \beta^{-n}
                                                                                                                                            by definition of normalization
                                                 \Rightarrow T \vdash \mathbf{nf}(\mathbf{P}') \geqslant \exists \beta^{-}_{i}, \downarrow \beta^{-}_{i}
                                                                                                                                            since ord \overrightarrow{\beta} in nf (N_1) = \beta^{-1}
                                                 \Rightarrow T, \beta^{-}_{i} \vdash \mathbf{nf}(\mathbf{P}') \geqslant \downarrow \beta^{-}_{i}
                                                       and \beta^-_i \notin \text{fv} (\text{nf} (P'))
                                                                                                                                            by lemma 70
By lemma 70, the last subtyping means that \mathbf{nf}(P') = \exists \overrightarrow{\alpha}. \downarrow N', such that
```

- (1) $T, \beta^-_j, \overrightarrow{\alpha}^- \vdash N'$
- (2) ord $\overrightarrow{\alpha}$ in $N' = \overrightarrow{\alpha}$
- (3) for some substitution $T, \beta^-_i \vdash \sigma : \overrightarrow{\alpha}, [\sigma]N' = \beta^-_i$.

Since $\beta^-_i \notin \text{fv}(\text{nf}(P'))$, the latter means that $N' = \alpha^-$, and then $\text{nf}(P') = \exists \alpha^- . \downarrow \alpha^-$ for some α^- . Finally, notice that all the types of shape $\exists \alpha^-$. $\downarrow \alpha^-$ are equal.

Lemma 87 (Completeness of Entry Singularity).

- Suppose that there exists N well-formed in T such that for any N' well-formed in T, $T \vdash N' : e$ implies $T \vdash N' \simeq^{\leq} N$. Then e singular with nf(N).
- + Suppose that there exists P well-formed in T such that for any P' well-formed in T, $T \vdash P'$: eimplies $T \vdash P' \simeq^{\leq} P$. Then e singular with nf (P).

Proof.

- By lemma 76, there exists $T \vdash N' : e$. Since N' is negative, by inversion of $T \vdash N' : e$, e has shape $\widehat{\alpha}^- :\simeq M$, where $T \vdash N' \simeq^{\leqslant} M$, and transitively, $T \vdash N \simeq^{\leqslant} M$. Then $\operatorname{nf}(M) = \operatorname{nf}(N)$. and *e* singular with nf (M) (by (\simeq_{-}^{SING})) is rewritten as *e* singular with nf (N).
- + By lemma 76, there exists $T \vdash P' : e$, then by assumption, $T \vdash P' \simeq P$, which by lemma 77 implies $T \vdash P : e$.

Let us consider the shape of *e*:

- Case 1. $e = (\widehat{\alpha}^+ : \simeq Q)$ then inversion of $T \vdash P : e$ implies $T \vdash P \simeq Q$, and hence $\operatorname{nf}(P) = \operatorname{nf}(Q)$ (by lemma 46). Then e singular with $\operatorname{nf}(Q)$, which holds by $(\simeq_+^{\operatorname{SING}})$, is rewritten as e singular with nf (P).
- Case 2. $e = (\alpha^+ : \ge Q)$. Then the inversion of $T \vdash P : e$ implies $T \vdash P \ge Q$. Let us consider the shape of Q:
 - a. $Q = \exists \overline{\beta^-}$. β^+ (for potentially empty $\overline{\beta^-}$). Then $T \vdash P \geqslant \exists \overline{\beta^-}$. β^+ implies $T \vdash P \simeq \emptyset$ β^+ by lemma 69, as was noted in the proof of lemma 86, and hence, **nf** (P) = β^+ Then *e* singular with β^+ , which holds by (: $\geq \alpha^{\text{SING}}$), can be rewritten as e singular with nf(P).
 - b. $Q = \exists \vec{\beta}^-$. $\downarrow N$ (for potentially empty $\vec{\beta}^-$). Notice that $T \vdash \exists \gamma^-$. $\downarrow \gamma^- \geqslant \exists \vec{\beta}^+$. $\downarrow N$ (by $(\exists^{\triangleright})$, with substitution N/γ^{-}), and thus, $T \vdash \exists \gamma^{-} . \downarrow \gamma^{-} : e$ by $(:\triangleright^{SAT})$. Then by assumption, $T \vdash \exists \gamma^- . \downarrow \gamma^- \simeq^{<} P$, that is $\mathbf{nf}(P) = \exists \gamma^- . \downarrow \gamma^-$. To apply $(:\geqslant\downarrow^{\text{SING}})$ to infer $(\widehat{\alpha}^+:\geqslant\exists\overrightarrow{\beta}^-,\downarrow N)$ singular with $\exists\gamma^-,\downarrow\gamma^-$, it is left to show that $N \simeq^D \beta^-_i$ for some *i*.
 - Since $T \vdash Q : e$, by assumption, $T \vdash Q \simeq^{\leq} P$, and by transitivity, $T \vdash Q \simeq^{\leq}$ $\exists \gamma^-. \downarrow \gamma^-$. It implies **nf** $(\exists \beta^-. \downarrow N) = \exists \gamma^-. \downarrow \gamma^-$ (by lemma 46), which by definition of normalization means $\exists \overrightarrow{\beta}^{-\prime}$. $\exists \mathbf{nf}(N) = \exists y^{-}$. $\exists y^{-}$, where ord $\overrightarrow{\beta}^{-}$ in $N' = \overrightarrow{\beta}^{-\prime}$

This way, $\beta^{-\prime}$ is a variable β^- , and $\mathbf{nf}(N) = \beta^-$. Notice that $\beta^- \in \beta^{-\prime} \subseteq \beta^-$ by lemma 33. This way, $N \simeq^D \beta^-$ for $\beta^- \in \beta^-$ (by lemma 46),

Lemma 88 (Soundness of Singularity). Suppose $\Sigma \vdash C : \Upsilon$, and C singular with $\widehat{\sigma}$. Then $\Sigma \vdash \widehat{\sigma} : \Upsilon$ $\Sigma \vdash \widehat{\sigma} : C$ and for any $\widehat{\sigma}'$ such that $\Sigma \vdash \widehat{\sigma} : C$, $\Sigma \vdash \widehat{\sigma}' \simeq^{\leqslant} \widehat{\sigma} : \Upsilon$.

PROOF. Suppose that $\Sigma \vdash \widehat{\sigma}' : C$. It means that for every $e \in C$ restricting $\widehat{\alpha}^{\pm}$, $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}']\widehat{\alpha}^{\pm} : e$ holds. C singular with $\widehat{\sigma}$ means e singular with $[\widehat{\sigma}]\widehat{\alpha}^{\pm}$, and hence, by lemma 87, $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}']\widehat{\alpha}^{\pm} \simeq \widehat{\sigma}$ $[\widehat{\sigma}]\widehat{\alpha}^{\pm}$ holds.

Since the uniqueness holds for every variable from **dom** (C), $\widehat{\sigma}$ is equivalent to $\widehat{\sigma}'$ on this set.

Observation 14 (Singularity is Deterministic). For a fixed C such that $\Sigma \vdash C : \Upsilon$, if C singular with $\widehat{\sigma}$ and C singular with $\widehat{\sigma}'$, then $\widehat{\sigma} = \widehat{\sigma}'$.

PROOF. By lemma 88, $\Sigma \vdash \widehat{\sigma} : \Upsilon$ and $\Sigma \vdash \widehat{\sigma}' : \Upsilon$. It means that both $\widehat{\sigma}$ and $\widehat{\sigma}'$ act as identity outside of Υ .

Moreover, for any $\widehat{\alpha}^{\pm} \in \Upsilon$, $\Sigma \vdash C : \Upsilon$ means that there is a unique $e \in C$ restricting $\widehat{\alpha}^{\pm}$. Then C singular with $\widehat{\sigma}$ means that e singular with $[\widehat{\sigma}]\widehat{\alpha}^{\pm}$. By looking at the inference rules, it is easy to see that $[\widehat{\sigma}]\widehat{\alpha}^{\pm}$ is uniquely determined by e, which, Similarly, $[\widehat{\sigma}']\widehat{\alpha}^{\pm}$ is also uniquely determined by e, in the same way, and hence, $[\widehat{\sigma}]\widehat{\alpha}^{\pm} = [\widehat{\sigma}']\widehat{\alpha}^{\pm}$.

Lemma 89 (Completeness of Singularity). For a given $\Sigma \vdash C$, suppose that all the substitutions satisfying C are equivalent on $\Upsilon \supseteq \mathbf{dom}(C)$. In other words, suppose that there exists $\Sigma \vdash \widehat{\sigma}_1 : \Upsilon$ such that for any $\Sigma \vdash \widehat{\sigma} : \Upsilon$, $\Sigma \vdash \widehat{\sigma} : C$ implies $\Sigma \vdash \widehat{\sigma} \simeq \widehat{\sigma}_1 : \Upsilon$. Then

- C singular with $\widehat{\sigma}_0$ for some $\widehat{\sigma}_0$ and
- $\Upsilon = \mathbf{dom}(C)$.

PROOF. First, let us assume $\Upsilon \neq \operatorname{dom}(C)$. Then there exists $\widehat{\alpha}^{\pm} \in \Upsilon \setminus \operatorname{dom}(C)$. Let us take $\Sigma \vdash \widehat{\sigma}_1 : \Upsilon$ such that any other substitution $\Sigma \vdash \widehat{\sigma} : \Upsilon$ satisfying C is equivalent to $\widehat{\sigma}_1$ on Υ .

Notice that $\Sigma \vdash \widehat{\sigma}_1 : C$: by lemma 76, there exists $\widehat{\sigma}'$ such that $\Sigma \vdash \widehat{\sigma}' : \Upsilon$ and $\Sigma \vdash \widehat{\sigma}' : C$, and by assumption, $\Sigma \vdash \widehat{\sigma}' \simeq^{\leqslant} \widehat{\sigma}_1 : \Upsilon$, implying $\Sigma \vdash \widehat{\sigma}' \simeq^{\leqslant} \widehat{\sigma}_1 : \mathbf{dom}(C)$.

Let us construct $\widehat{\sigma}_2$ such that $\Sigma \vdash \widehat{\sigma}_2 : \Upsilon$ as follows:

$$\begin{cases} [\widehat{\sigma}_2] \widehat{\beta}^{\pm} = [\widehat{\sigma}_1] \widehat{\beta}^{\pm} & \text{if } \widehat{\beta}^{\pm} \neq \widehat{\alpha}^{\pm} \\ [\widehat{\sigma}_2] \widehat{\alpha}^{\pm} = T & \text{where } T \text{ is any closed type not equivalent to } [\widehat{\sigma}_1] \widehat{\alpha}^{\pm} \end{cases}$$

It is easy to see that $\Sigma \vdash \widehat{\sigma}_2 : C$ since $\widehat{\sigma}_1|_{\mathbf{dom}\;(C)} = \widehat{\sigma}_2|_{\mathbf{dom}\;(C)}$, and $\Sigma \vdash \widehat{\sigma}_1 : C$. However, $\Sigma \vdash \widehat{\sigma}_2 \simeq^{\leqslant} \widehat{\sigma}_1 : \Gamma$ does not hold because by construction, $\Sigma(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}_2]\widehat{\alpha}^{\pm} \simeq^{\leqslant} [\widehat{\sigma}_1]\widehat{\alpha}^{\pm}$ does not hold. This way, we have a contradiction.

Second, let us show C singular with $\widehat{\sigma}_0$. Let us take arbitrary $e \in C$ restricting $\widehat{\beta}^{\pm}$. We need to show that e is singular. Notice that $\Sigma \vdash \widehat{\sigma}_1 : C$ implies $\Sigma(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_1]\widehat{\beta}^{\pm}$ and $\Sigma(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_1]\widehat{\beta}^{\pm}$. e. We will show that any other type satisfying e is equivalent to $[\widehat{\sigma}_1]\widehat{\beta}^{\pm}$, then by lemma 87 e singular with $[\widehat{\sigma}_1]\widehat{\beta}^{\pm}$.

• if $\widehat{\beta}^{\pm}$ is positive, let us take any type $\Sigma(\widehat{\beta}^{\pm}) \vdash P'$ and assume $\Sigma(\widehat{\beta}^{\pm}) \vdash P' : e$. We will show that $\Sigma(\widehat{\beta}^{\pm}) \vdash P' \simeq^{\epsilon} [\widehat{\sigma}_1] \widehat{\beta}^{\pm}$, which by lemma 46 will imply e singular with $\inf([\widehat{\sigma}_1] \widehat{\beta}^{\pm})$. Let us construct $\widehat{\sigma}_2$ such that $\Sigma \vdash \widehat{\sigma}_2 : \Upsilon$ as follows:

$$\begin{cases} [\widehat{\sigma}_2] \widehat{\gamma}^{\pm} = [\widehat{\sigma}_1] \widehat{\gamma}^{\pm} & \text{if } \widehat{\gamma}^{\pm} \neq \widehat{\beta}^{\pm} \\ [\widehat{\sigma}_2] \widehat{\beta}^{\pm} = P' \end{cases}$$

It is easy to see that $\Sigma \vdash \widehat{\sigma}_2 : C$: for $e, \Sigma(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_2] \widehat{\beta}^{\pm} : e$ by construction, since $\Sigma(\widehat{\beta}^{\pm}) \vdash P' : e$; for any other $e' \in C$ restricting $\widehat{\gamma}^{\pm}$, $[\widehat{\sigma}_2] \widehat{\gamma}^{\pm} = [\widehat{\sigma}_1] \widehat{\gamma}^{\pm}$, and $\Sigma(\widehat{\gamma}^{\pm}) \vdash [\widehat{\sigma}_1] \widehat{\gamma}^{\pm} : e'$ since $\Sigma \vdash \widehat{\sigma}_1 : C$. Then by assumption, $\Sigma \vdash \widehat{\sigma}_2 \simeq^{\epsilon} \widehat{\sigma}_1 : \Upsilon$, which in particular means $\Sigma(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_2] \widehat{\beta}^{\pm} \simeq^{\epsilon} [\widehat{\sigma}_1] \widehat{\beta}^{\pm}$, that is $\Sigma(\widehat{\beta}^{\pm}) \vdash P' \simeq^{\epsilon} [\widehat{\sigma}_1] \widehat{\beta}^{\pm}$.

• if $\widehat{\beta}^{\pm}$ is negative, the proof is analogous.

11.2 Correctness of the Typing Algorithm

 Lemma 90 (Determinicity of typing algorithm). *Suppose that* $T \vdash \Gamma$ *and* $T \vdash^{\supseteq} \Sigma$. *Then*

- + If T; $\Gamma \models \nu$: P and T; $\Gamma \models \nu$: P' then P = P'.
- If T; $\Gamma \models c$: N and T; $\Gamma \models c$: N' then N = N'.
- If $T : \Gamma : \Sigma \models \mathbb{N} \bullet \overrightarrow{v} \implies M = \Sigma' : C \text{ and } T : \Gamma : \Sigma \models \mathbb{N} \bullet \overrightarrow{v} \implies M' = \Sigma' : C' \text{ then } M = M' \\ \Sigma = \Sigma', \text{ and } C = C'.$

PROOF. We show it by structural induction on the inference tree. Notice that the last rule used to infer the judgement is uniquely determined by the input, and that each premise of each inference rule is deterministic by the corresponding observation.

Let us extend the declarative typing metric (definition 33) to the algorithmic typing.

Definition 34 (Size of an Algorithmic Judgement). For an algorithmic typing judgement J let us define a metrics size (J) as a pair of numbers in the following way:

```
+ size(T; \Gamma \models v : P) = (\text{size}(v), 0);
```

- $\operatorname{size}(T; \Gamma \models c : N) = (\operatorname{size}(c), 0);$
- $\operatorname{size}(T; \Gamma; \Sigma \models N \bullet \overrightarrow{v} \Longrightarrow M \ni \Sigma'; C) = (\operatorname{size}(\overrightarrow{v}), \operatorname{npq}(N)))$

Definition 35 (Metric). We extend the metric from definition 33 to the algorithmic typing in the following way. For a tree T inferring an algorithmic typing judgement J, we define size(T) as (size(J), 0).

Soundness and completeness are proved by mutual induction on the metric of the inference tree

Lemma 91 (Soundness of typing). Suppose that $T \vdash \Gamma$. For an inference tree T_1 ,

- + If T_1 infers T; $\Gamma \models \nu$: P then $T \vdash P$ and T; $\Gamma \vdash \nu$: P
- If T_1 infers T; $\Gamma \models c$: N then $T \vdash N$ and T; $\Gamma \vdash c$: N
- If T_1 infers $T : \Gamma : \Sigma \models \mathbb{N} \bullet \overrightarrow{v} \implies M = \Sigma' : C$ for $T \vdash^{\supseteq} \Sigma$ and $T : \mathbf{dom}(\Sigma) \vdash \mathbb{N}$ free from negative algorithmic variables, then
 - (1) $T \vdash^{\supseteq} \Sigma'$
 - (2) $\Sigma \subseteq \Sigma'$
 - (3) $T : \mathbf{dom}(\Sigma') \vdash M$
 - (4) $\operatorname{dom}(\Sigma) \cap \operatorname{uv}(M) \subseteq \operatorname{uv} N$
 - (5) M is normalized and free from negative algorithmic variables
 - $(6) \Sigma'|_{\mathbf{uv} N \cup \mathbf{uv} M} \vdash C$
 - (7) for any $\Sigma' \vdash \widehat{\sigma} : \mathbf{uv} \ N \cup \mathbf{uv} \ M$, $\Sigma' \vdash \widehat{\sigma} : C \text{ implies } T ; \Gamma \vdash [\widehat{\sigma}] \ N \bullet \overrightarrow{v} \implies [\widehat{\sigma}] \ M$

PROOF. We prove it by induction on metric(T_1), mutually with the completeness of typing (lemma 91). Let us consider the last rule used to infer the derivation.

```
Case 1. (VAR<sup>INF</sup>) We are proving that if T; \Gamma \models x : \mathbf{nf}(P) then T \vdash \mathbf{nf}(P) and T; \Gamma \vdash x : \mathbf{nf}(P). By inversion, x : P \in \Gamma. Since T \vdash \Gamma, we have T \vdash P, and by corollary 14, T \vdash \mathbf{nf}(P). By applying (VAR<sup>INF</sup>) to x : P \in \Gamma, we infer T; \Gamma \vdash x : P. Finally, by (\simeq_+^{INF}), since T \vdash P \simeq_-^{<} \mathbf{nf}(P) (corollary 16), we have T; \Gamma \vdash x : \mathbf{nf}(P).
```

```
Case 2. (\{\}^{INF})
5146
                     We are proving that if T; \Gamma \models \{c\}: \downarrow N then T \vdash \downarrow N and T; \Gamma \vdash \{c\}: \downarrow N.
5147
5148
                     to T; \Gamma \models c: N, we have
5149
                      (1) T \vdash N, and hence, T \vdash \downarrow N;
5150
                      (2) T; \Gamma \vdash c: N, which by ({} INF) implies T; \Gamma \vdash \{c\}: \downarrow N.
5151
                  Case 3. (RET<sup>INF</sup>) The proof is symmetric to the previous case (case 2).
5152
5153
                  Case 4. (ANN<sub>+</sub><sup>INF</sup>) We are proving that if T; \Gamma \models (v : Q) : \mathbf{nf}(Q) then T \vdash \mathbf{nf}(Q) and T; \Gamma \vdash (v : Q) : \mathbf{nf}(Q)
                      Q): nf (Q).
5154
                     By inversion of T; \Gamma \models (v : Q): nf (Q), we have:
5155
                      (1) T \vdash (v : Q), hence, T \vdash Q, and by corollary 14, T \vdash \mathbf{nf}(Q);
5156
                      (2) T; \Gamma \models \nu : P, which by the induction hypothesis implies T \vdash P and T; \Gamma \vdash \nu : P;
5157
5158
                      (3) T; \cdot \models Q \geqslant P \Rightarrow \cdot, which by lemma 78 implies T \models [\cdot] Q \geqslant P, that is T \models Q \geqslant P.
                     To infer T; \Gamma \vdash (v : Q) : Q, we apply (ANN_+^{INF}) to T; \Gamma \vdash v : P and T \vdash Q \geqslant P. Then by (\simeq_+^{INF}).
5159
                     T; \Gamma \vdash (\nu : Q) : \mathbf{nf}(Q).
5160
                 Case 5. (ANN_* ) The proof is symmetric to the previous case (case 4).
5161
                 Case 6. (\lambda^{\text{INF}}) We are proving that if T; \Gamma \models \lambda x : P. c : \text{nf}(P \to N) then T \vdash \text{nf}(P \to N) and
5162
5163
                     T; \Gamma \vdash \lambda x : P. c : \mathbf{nf} (P \to N).
                     By inversion of T; \Gamma \models \lambda x : P. c : \mathbf{nf}(P \to N), we have T \vdash \lambda x : P. c, which implies T \vdash P.
5164
                     Also by inversion of T; \Gamma \models \lambda x : P. c: \mathbf{nf}(P \to N), we have T; \Gamma, x : P \models c: N, applying
5165
                     induction hypothesis to which gives us:
                      (1) T \vdash N, thus T \vdash P \to N, and by corollary 14, T \vdash \mathbf{nf}(P \to N);
5167
                      (2) T; \Gamma, x : P \vdash c : N, which by (\lambda^{\text{INF}}) implies T; \Gamma \vdash \lambda x : P : c : P \to N, and by (\simeq_{+}^{\text{INF}})
5168
                            T; \Gamma \vdash \lambda x : P. c: nf (P \rightarrow N).
5169
                 Case 7. (\Lambda^{\text{INF}}) We are proving that if T; \Gamma \models \Lambda \alpha^+. c: \mathbf{nf} (\forall \alpha^+, N) then T; \Gamma \vdash \Lambda \alpha^+. c: \mathbf{nf} (\forall \alpha^+, N)
5170
                     and T \vdash \mathbf{nf} (\forall \alpha^+. N).
5171
                     By inversion of T, \alpha^+; \Gamma \models c : N, we have T \vdash \Lambda \alpha^+. c, which implies T, \alpha^+ \vdash c.
5172
                     Also by inversion of T, \alpha^+; \Gamma \models c : N, we have T, \alpha^+; \Gamma \models c : N. Obtaining the induction
5173
                     hypothesis to T, \alpha^+; \Gamma \models c : N, we have:
5174
                      (1) T, \alpha^+ \vdash N, thus T \vdash \forall \alpha^+. N, and by corollary 14, T \vdash \mathbf{nf} (\forall \alpha^+, N);
5175
                      (2) T, \alpha^+; \Gamma \vdash c : N, which by (\Lambda^{\text{INF}}) implies T; \Gamma \vdash \Lambda \alpha^+. c : \forall \alpha^+. N, and by (\simeq_+^{\text{INF}}), T; \Gamma \vdash
5176
                            \Lambda \alpha^+. c: nf (\forall \alpha^+, N).
5177
                 Case 8. (LET<sup>INF</sup>) We are proving that if T; \Gamma \models \text{let } x = v; c : N \text{ then } T; \Gamma \vdash \text{let } x = v; c : N \text{ and}
5178
                     T \vdash N.
5179
                     By inversion of T; \Gamma \models \mathbf{let} \ x = v; c : N, we have:
5180
                      (1) T \vdash \text{let } x = v; c, which gives us T \vdash v and T \vdash c.
5181
                      (2) T; \Gamma \models v : P, which by the induction hypothesis implies T \vdash P (and thus, T \vdash \Gamma, x : P)
5182
                             and T; \Gamma \vdash \nu : P;
5183
                      (3) T; \Gamma, x : P \models c : N, which by the induction hypothesis implies T \vdash N and T; \Gamma, x : P \vdash
5184
                            c: N.
5185
                     This way, T; \Gamma \vdash \mathbf{let} \ x = v; c : N holds by (LET<sup>INF</sup>).
5186
                 Case 9. (LET_{:(a)}^{INF}) We are proving that if T; \Gamma \models \mathbf{let} \ x : P = \nu(\overrightarrow{v}); c' : N then T; \Gamma \vdash \mathbf{let} \ x : P = v(\overrightarrow{v})
5187
                     v(\overrightarrow{v}); c': \overrightarrow{N} and T \vdash N.
5188
                     By inversion, we have:
5189
                      (1) T \vdash P, hence, T \vdash \Gamma, x : P
5190
                      (2) T; \Gamma \models \nu : \downarrow M
5191
                      (3) T : \Gamma : \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q = \Sigma : C_1
5192
5193
```

```
(4) T; \Sigma \models \uparrow Q \leqslant \uparrow P = C_2
5195
                           (5) \Sigma \vdash C_1 \& C_2 = C
5196
                           (6) T; \Gamma, x : P \models c' : N
5197
                         By the induction hypothesis applied to T; \Gamma \models \nu : \downarrow M, we have T; \Gamma \vdash \nu : \downarrow M and T \vdash \downarrow M
5198
                         (and hence, T; dom (\Sigma) \vdash M).
5199
                         By the induction hypothesis applied to T; \Gamma, x : P \models c' : N, we have T; \Gamma, x : P \models c' : N and
5200
5201
                         T \vdash N.
                         By the induction hypothesis applied to T ; \Gamma ; \cdot \models M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q \exists \Sigma ; C_1, we have:
5202
                           (1) T \vdash^{\supseteq} \Sigma,
5203
                           (2) T : \mathbf{dom}(\Sigma) \vdash \uparrow \mathcal{O},
5204
                           (3) \Sigma'|_{\mathbf{uv} \ \underline{M} \cup \mathbf{uv} \ \underline{O}} \vdash C_1, and thus, \mathbf{dom}(C_1) \subseteq \mathbf{uv} \ \underline{M} \cup \mathbf{uv} \ \underline{Q}.
5205
                           (4) for any \Sigma' \vdash \widehat{\sigma} : C_1, we have T : \Gamma \vdash [\widehat{\sigma}] M \bullet \overrightarrow{v} \Longrightarrow [\widehat{\sigma}] \uparrow Q.
5206
                         By soundness of negative subtyping (lemma 84) applied to T; \Sigma \models \uparrow Q \leq \uparrow P = C_2, we have
5207
                         \Sigma \vdash C_2 : \mathbf{uv} (\uparrow \mathbf{Q}), and thus, \mathbf{uv} (\uparrow \mathbf{Q}) = \mathbf{dom} (C_2).
5208
                         By soundness of constraint merge (lemma 81), \operatorname{dom}(C) = \operatorname{dom}(C_1) \cup \operatorname{dom}(C_2) \subseteq \operatorname{uv} M \cup \operatorname{dom}(C_2)
5209
                         uv \bigcirc Then by lemma 76, let us take \widehat{\sigma} such that \Sigma \vdash \widehat{\sigma} : \mathbf{uv}(M) \cup \mathbf{uv}(\bigcirc) and \Sigma \vdash \widehat{\sigma} : C. By
5210
5211
                         the soundness of constraint merge, \Sigma \vdash \widehat{\sigma} : C_1 and \Sigma \vdash \widehat{\sigma} : C_2, and by weakening, \Sigma' \vdash \widehat{\sigma} : C_1
                         and \Sigma' \vdash \widehat{\sigma} : C_2.
5212
                         Then as noted above (4), T : \Gamma \vdash M \bullet \overrightarrow{v} \implies [\widehat{\sigma}] \uparrow Q And again, by soundness of negative
                         subtyping (lemma 84) applied to T; \Sigma \models \uparrow Q \leq \uparrow P \Rightarrow C_2, we have T \vdash [\widehat{\sigma}] \uparrow Q \leq \uparrow P.
                         To infer T; \Gamma \vdash \text{let } x : P = \nu(\overrightarrow{v}); c' : N, we apply the corresponding declarative rule (LET^{\text{INF}}_{-(n)})
                         where Q is [\widehat{\sigma}] Q. Notice that all the premises were already shown to hold above:
                           (1) T \vdash P and T; \Gamma \vdash v : \downarrow M from the assumption,
                           (2) T : \Gamma \vdash M \bullet \overrightarrow{v} \implies \uparrow [\widehat{\sigma}] \bigcirc \text{ holds since } [\widehat{\sigma}] \uparrow \bigcirc = \uparrow [\widehat{\sigma}] \bigcirc ,
                           (3) T + \uparrow [\widehat{\sigma}] \bigcirc \leq \uparrow P by soundness of negative subtyping,
5220
                           (4) T; \Gamma, x : P \vdash c' : N from the induction hypothesis.
                     Case 10. (LET<sub>(a)</sub><sup>INF</sup>) We are proving that if T; \Gamma \models \text{let } x = v(\overrightarrow{v}); c' : N \text{ then } T; \Gamma \vdash \text{let } x = v(\overrightarrow{v})
5222
                         v(\overrightarrow{v}); c': \overrightarrow{N} and T \vdash N.
                         By the inversion, we have:
                           (1) T; \Gamma \models \nu : \downarrow M
                           (2) T : \Gamma : \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow \bigcirc \exists \Sigma : C
5226
                           (3) uv Q \subseteq dom(C)
                           (4) C|_{\mathbf{uv}}(\mathbf{0}) singular with \widehat{\sigma}_3
5228
                           (5) T; \Gamma, x : [\widehat{\sigma}_3] Q \models c' : N
                         By the induction hypothesis applied to T; \Gamma \models \nu : \downarrow M, we have T; \Gamma \vdash \nu : \downarrow M and T \vdash \downarrow M
5230
                         (and thus, T; dom (\Sigma) \vdash M).
5231
                         By the induction hypothesis applied to T; \Gamma, x : [\widehat{\sigma}_3] Q \models c' : N, we have T \vdash N and
5232
                         T; \Gamma, x : [\widehat{\sigma}_3] Q \vdash c' : N.
5233
                         By the induction hypothesis applied to T ; \Gamma ; \vdash M \bullet \vec{v} \implies \uparrow Q = \Sigma ; C, we have:
5234
                          (1) T \vdash^{\supseteq} \Sigma
5235
                           (2) T : \mathbf{dom}(\Sigma) \vdash \uparrow Q
5236
                           (3) \Sigma|_{\mathbf{uv}\ M \cup \mathbf{uv}\ \mathcal{O}} \vdash C (and thus, \mathbf{dom}\ (C) \subseteq \mathbf{uv}\ M \cup \mathbf{uv}\ \mathcal{Q})
5237
                           (4) for any \Sigma \vdash \widehat{\sigma} : C, we have T : \Gamma \vdash [\widehat{\sigma}] M \bullet \overrightarrow{v} \implies [\widehat{\sigma}] \uparrow Q, which, since M is ground
5238
                                  means T : \Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow [\widehat{\sigma}] Q.
5239
                         To infer T; \Gamma \vdash \text{let } x = \nu(\overrightarrow{v}); c' : N, we apply the corresponding declarative rule (LET^{\text{INF}}_{(0)})
5240
                         Let us show that the premises hold:
```

• T; $\Gamma \vdash v$: $\downarrow M$ holds by the induction hypothesis;

5241

- T; Γ , x: $[\widehat{\sigma}_3] Q \vdash c'$: N also holds by the induction hypothesis, as noted above;
- Let us take an arbitrary substitution $\widehat{\sigma} \Sigma \vdash \widehat{\sigma} : \mathbf{uv} M \cup \mathbf{uv} Q$ satisfying $\Sigma \vdash \widehat{\sigma} : C$ (it exists by lemma 76). Then $T : \Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow [\widehat{\sigma}] Q$ holds, as noted above;
- To show the uniqueness of $\uparrow [\widehat{\sigma}] Q$, we assume that for some other type K holds $T ; \Gamma \vdash M \bullet \overrightarrow{v} \implies K$, that is $T ; \Gamma \vdash [\cdot] M \bullet \overrightarrow{v} \implies K$. Then by the completeness of typing (lemma 92), there exist N', Σ' , and C' such that
 - (1) $T ; \Gamma ; \cdot \models M \bullet \overrightarrow{v} \Longrightarrow N' = \Sigma' ; C'$ and
 - (2) there exists a substitution $\Sigma' \vdash \widehat{\sigma}' : C'$ such that $T \vdash [\widehat{\sigma}'] N' \simeq^{\leq} K$.

By determinicity of the typing algorithm (lemma 90), $T : \Gamma : \vdash M \bullet \overrightarrow{v} \implies N' = \Sigma' : C'$, means that C' is C, Σ' is Σ , and N' is $\uparrow Q$. This way, $T \vdash [\widehat{\sigma}'] \uparrow Q \simeq^{\leqslant} K$ for substitution $\Sigma \vdash \widehat{\sigma}' : C$.

It is left to show that $T \vdash [\widehat{\sigma}'] \uparrow Q \simeq^{\leqslant} [\widehat{\sigma}] \uparrow Q$, then by transitivity of equivalence, we will have $T \vdash [\widehat{\sigma}] \uparrow Q \simeq^{\leqslant} K$. Since $\Sigma \vdash \widehat{\sigma} : C|_{\mathbf{uv}(Q)}$ and $\Sigma \vdash \widehat{\sigma}' : C|_{\mathbf{uv}(Q)}$, and $C|_{\mathbf{uv}(Q)}$ singular with $\widehat{\sigma}_3$, we have $\Sigma \vdash \widehat{\sigma} \simeq^{\leqslant} \widehat{\sigma}_3 : \mathbf{dom}(C) \cap \mathbf{uv}(Q)$ and $\Sigma \vdash \widehat{\sigma}' \simeq^{\leqslant} \widehat{\sigma}_3 : \mathbf{dom}(C) \cap \mathbf{uv}(Q)$. Then since $\mathbf{uv}(Q) \subseteq \mathbf{dom}(C)$, we have $\mathbf{dom}(C) \cap \mathbf{uv}(Q) = \mathbf{uv}(Q)$. This way, by transitivity and symmetry of the equivalence, $\Sigma \vdash \widehat{\sigma} \simeq^{\leqslant} \widehat{\sigma}' : \mathbf{uv}(Q)$, which implies $T \vdash [\widehat{\sigma}'] \uparrow Q \simeq^{\leqslant} [\widehat{\sigma}] \uparrow Q$.

Case 11. (LET $^{\text{INF}}_{\exists}$) We are proving that if T; $\Gamma \models \text{let}^{\exists}(\overrightarrow{\alpha}^2, x) = v$; c' : N then T; $\Gamma \vdash \text{let}^{\exists}(\overrightarrow{\alpha}^2, x) = v$; c' : N and $T \vdash N$. By the inversion, we have:

- (1) $T; \Gamma \models \nu : \exists \overrightarrow{\alpha} . P$
- (2) $T, \overrightarrow{\alpha}$; $\Gamma, x : P \models c' : N$
- (3) $T \vdash N$

By the induction hypothesis applied to $T; \Gamma \models \nu : \exists \overrightarrow{\alpha}^{=}. P$, we have $T; \Gamma \vdash \nu : \exists \overrightarrow{\alpha}^{=}. P$ and $\exists \overrightarrow{\alpha}^{=}. P$ is normalized. By the induction hypothesis applied to $T, \overrightarrow{\alpha}^{=}; \Gamma, x : P \models c' : N$, we have $T, \overrightarrow{\alpha}^{=}; \Gamma, x : P \vdash c' : N$.

To show T; $\Gamma \vdash \mathbf{let}^{\exists}(\overrightarrow{\alpha}, x) = v$; c' : N, we apply the corresponding declarative rule (LET $_{\exists}^{\mathsf{INF}}$) Let us show that the premises hold:

- (1) $T; \Gamma \vdash \nu : \exists \overrightarrow{\alpha}$. P holds by the induction hypothesis, as noted above,
- (2) **nf** $(\exists \alpha^{-}. P) = \exists \alpha^{-}. P$ holds since $\exists \alpha^{-}. P$ is normalized,
- (3) $T, \alpha^{-1}; \Gamma, x : P \vdash c' : N$ also holds by the induction hypothesis,
- (4) $T \vdash N$ holds by the inversion, as noted above.

Case 12. $(\emptyset_{\bullet \Longrightarrow}^{INF})$ Then by assumption:

- $T \vdash^{\supseteq} \Sigma$,
- T; $\operatorname{dom}(\Sigma) \vdash N$ is free from negative algorithmic variables,
- $T ; \Gamma ; \Sigma \models \mathbb{N} \bullet \cdot \Longrightarrow \mathbf{nf} (\mathbb{N}) \not\exists \Sigma ; \cdot .$

Let us show the required properties:

- (1) $T \vdash^{\supseteq} \Sigma$ holds by assumption,
- (2) $\Sigma \subseteq \Sigma$ holds trivially,
- (3) **nf** (N) is evidently normalized, T; **dom** (Σ) $\vdash N$ implies T; **dom** (Σ) \vdash **nf** (N) by corollary 24, and lemma 38 means that **nf** (N) is inherently free from negative algorithmic variables,
- (4) $\operatorname{dom}(\Sigma) \cap \operatorname{uv}(\operatorname{nf}(N)) \subseteq \operatorname{uv}(N)$ holds since $\operatorname{uv}(\operatorname{nf}(N)) = \operatorname{uv}(N)$,
- (5) $\Sigma|_{\mathbf{uv} \ \mathbf{N} \cup \mathbf{uv} \ \mathbf{nf} \ (\mathbf{N})} \vdash \cdot \text{ holds trivially,}$
- (6) suppose that $\Sigma \vdash \widehat{\sigma} : \mathbf{uv} \ N \cup \mathbf{uv} \ \mathbf{nf} \ (N)$. To show $T : \Gamma \vdash [\widehat{\sigma}] \ N \bullet \cdot \Rightarrow [\widehat{\sigma}] \ \mathbf{nf} \ (N)$, we apply the corresponding declarative rule $(\emptyset_{\bullet \Rightarrow}^{\text{INF}})$. To show $T \vdash [\widehat{\sigma}] \ N \simeq^{\epsilon} [\widehat{\sigma}] \ \mathbf{nf} \ (N)$, we apply the following sequence: $N \simeq^D \ \mathbf{nf} \ (N)$ by lemma 39, then $[\widehat{\sigma}] \ N \simeq^D [\widehat{\sigma}] \ \mathbf{nf} \ (N)$ by corollary 21, then $T \vdash [\widehat{\sigma}] \ N \simeq^{\epsilon} [\widehat{\sigma}] \ \mathbf{nf} \ (N)$ by lemma 27.

109

The Proofs Case 13. $(\rightarrow^{\text{INF}}_{\bullet})$ By assumption: 5293 (1) $T \vdash^{\supseteq} \Sigma$, 5294 (2) T; $\operatorname{dom}(\Sigma) \vdash Q \to N$ is free from negative algorithmic variables, and hence, so are 5295 Q and N, 5296 (3) $T : \Gamma : \Sigma \models Q \rightarrow N \bullet v, \overrightarrow{v} \Longrightarrow M = \Sigma' : C$, and by inversion: 5297 (a) $T; \Gamma \models v : P$, and by the induction hypothesis applied to this judgment, we have 5298 T; $\Gamma \vdash \nu$: P, and $T \vdash P$; 5299 (b) $T; \Sigma \models Q \geqslant P = C_1$, and by the soundness of subtyping: $\Sigma \vdash C_1 : \mathbf{uv} Q$ (and thus, 5300 $\operatorname{dom}(C_1) = \operatorname{uv} \mathcal{Q}$), and for any 5301 $\Sigma \vdash \widehat{\sigma} : C_1$, we have $T \vdash [\widehat{\sigma}] Q \geqslant P$; 5302 (c) T; Γ ; $\Sigma \models \mathbb{N} \bullet \overrightarrow{v} \implies \mathbb{M} \ni \Sigma'$; C_2 , and by the induction hypothesis applied to 5303 this judgment, 5304 (i) $T \vdash^{\supseteq} \Sigma'$, 5305 (ii) $\Sigma \subseteq \Sigma'$, 5306 (iii) T; **dom** (Σ') $\vdash M$ is normalized and free from negative algorithmic variables. 5307 (iv) $\operatorname{dom}(\Sigma) \cap \operatorname{uv}(M) \subseteq \operatorname{uv} N$, 5308 (v) $\Sigma'|_{\mathbf{uv}(M)\cup\mathbf{uv}(N)} \vdash C_2$, and thus, $\mathbf{dom}(C_2) \subseteq \mathbf{uv}(M) \cup \mathbf{uv}(N)$, 5309 (vi) for any $\widehat{\sigma}$ such that $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(M) \cup \mathbf{uv}(N)$ and $\Sigma' \vdash \widehat{\sigma} : C_2$, we have 5310 $T : \Gamma \vdash [\widehat{\sigma}] N \bullet \overrightarrow{v} \Longrightarrow [\widehat{\sigma}] M$ (d) $\Sigma \vdash C_1 \& C_2 = C$, which by lemma 81 implies $\operatorname{dom}(C) = \operatorname{dom}(C_1) \cup \operatorname{dom}(C_2) \subseteq$ $uv \bigcirc \cup uv M \cup uv N$. Let us show the required properties: (1) $T \vdash^{\supseteq} \Sigma'$ is shown above, (2) $\Sigma \subseteq \Sigma'$ is shown above, (3) T; $\operatorname{dom}(\Sigma') \vdash M$ is normalized and free from negative algorithmic variables, as shown (4) $\operatorname{dom}(\Sigma) \cap \operatorname{uv}(M) \subseteq \operatorname{uv}(N) \subseteq \operatorname{uv}(Q) \to N$ (the first inclusion is shown above, the second one is by definition), 5320 (5) To show $\Sigma'|_{uv}(0) \cup uv(N) \cup uv(M) \vdash C$, first let us notice that $uv(Q) \cup uv(N) \cup uv(M) \subseteq$ **dom** (*C*), as mentioned above. Then we demonstrate $\Sigma' \vdash C : \Sigma \vdash C_1$ and $\Sigma \subseteq \Sigma'$ imply 5322 $\Sigma' \vdash C_1$, by the soundness of constraint merge (lemma 81) applied to $\Sigma' \vdash C_1 \& C_2 = C$ (a) $\Sigma' \vdash C$, 5324 (b) for any $\Sigma' \vdash \widehat{\sigma} : C, \Sigma' \vdash \widehat{\sigma} : C_i$ holds; (6) Suppose that $\Sigma' \vdash \widehat{\sigma} : \mathbf{uv}(Q) \cup \mathbf{uv}(N) \cup \mathbf{uv}(M)$ and $\Sigma' \vdash \widehat{\sigma} : C$. To show $T ; \Gamma \vdash \mathcal{V}$ 5326 $[\widehat{\sigma}](Q \to N) \bullet v, \overrightarrow{v} \Longrightarrow [\widehat{\sigma}]M$, that is $T : \Gamma \vdash [\widehat{\sigma}]Q \to [\widehat{\sigma}]N \bullet v, \overrightarrow{v} \Longrightarrow [\widehat{\sigma}]M$, we apply the corresponding declarative rule $(\rightarrow_{\bullet \Rightarrow}^{\text{INF}})$. Let us show the required premises: 5328 5329 (a) T; $\Gamma \vdash \nu$: P holds as shown above, 5330 (b) $T \vdash [\widehat{\sigma}] Q \geqslant P$ holds since $T \vdash [\widehat{\sigma}|_{uv} Q) Q \geqslant P$ by the soundness of subtyping 5331 as noted above: since $\Sigma' \vdash \widehat{\sigma} : C$ implies $\Sigma' \vdash \widehat{\sigma}|_{\mathbf{uv}}(\bigcirc) : C_1$, which we strengthen 5332 to $\Sigma \vdash \widehat{\sigma}|_{\mathbf{uv}(\bigcirc)} : C_1$, 5333 (c) $T : \Gamma \vdash [\widehat{\sigma}] N \bullet \overrightarrow{v} \implies [\widehat{\sigma}] M$ holds by the induction hypothesis as shown above 5334 since $\Sigma' \vdash \widehat{\sigma} : C$ implies $\Sigma' \vdash \widehat{\sigma} : C_2$, and then $\Sigma' \vdash \widehat{\sigma}|_{\mathbf{uv}(N) \cup \mathbf{uv}(M)} : C_2$ and 5335 $\Sigma \vdash \widehat{\sigma}|_{\mathbf{uv}(N) \cup \mathbf{uv}(M)} : \mathbf{uv}(N) \cup \mathbf{uv}(M).$ 5336

Case 14. (∀_{•⇒}^{INF})

5337

5338

5339

5340 5341 By assumption:

- (1) $T \vdash^{\supseteq} \Sigma$,
- (2) $T : \mathbf{dom}(\Sigma) \vdash \forall \alpha^{+}$. N is free from negative algorithmic variables,

- (3) $T ; \Gamma ; \Sigma \models \forall \overrightarrow{\alpha^+}. \ N \bullet \overrightarrow{v} \implies M \dashv \Sigma' ; C$, which by inversion means $\overrightarrow{v} \neq \cdot, \overrightarrow{\alpha^+} \neq \cdot$, and $T ; \Gamma ; \Sigma, \widehat{\alpha^+} \{T\} \models [\widehat{\alpha^+}/\alpha^+] \ N \bullet \overrightarrow{v} \implies M \dashv \Sigma' ; C$. It is easy to see that the induction hypothesis is applicable to the latter judgment:
 - $T \vdash^{\supseteq} \Sigma, \overrightarrow{\alpha}^{+} \{T\}$ holds by $T \vdash^{\supseteq} \Sigma$,
 - T; $\operatorname{dom}(\Sigma)$, $\overrightarrow{\alpha^+} \vdash [\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}] \underline{N}$ holds since T; $\operatorname{dom}(\Sigma) \vdash \forall \overrightarrow{\alpha^+}$. \underline{N} $[\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}] \underline{N}$ is normalized and free from negative algorithmic variables since so is \underline{N} ;

This way, by the inductive hypothesis applied to T; Γ ; Σ , $\overrightarrow{\alpha}^+\{T\} \models [\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+] \stackrel{\mathbf{N}}{\bullet} \bullet \overrightarrow{v} \implies M \ni \Sigma'$; C, we have:

- (a) $T \vdash^{\supseteq} \Sigma'$,
- (b) $\Sigma, \overrightarrow{\alpha}^+ \{T\} \subseteq \Sigma',$
- (c) T; **dom** (Σ') $\vdash M$ is normalized and free from negative algorithmic variables,
- (d) $\operatorname{dom}(\Sigma, \overrightarrow{\alpha^+} \{T\}) \cap \operatorname{uv}(M) \subseteq \operatorname{uv}([\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}]N),$
- (e) $\Sigma'|_{\Upsilon \cup \mathbf{uv}(N) \cup \mathbf{uv}(M)} \vdash C$, where Υ denotes $\mathbf{uv}([\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+]N) \cap \overrightarrow{\alpha}^+$, that is the algorithmization of the \forall -variables that are actually used in N.
- (f) for any $\widehat{\sigma}$ such that $\Sigma' \vdash \widehat{\sigma} : \Upsilon \cup \mathbf{uv}(N) \cup \mathbf{uv}(M)$ and $\Sigma' \vdash \widehat{\sigma} : C$, we have $T : \Gamma \vdash [\widehat{\sigma}][\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}]N \bullet \overrightarrow{v} \Rightarrow [\widehat{\sigma}]M$.

Let us show the required properties:

- (1) $T \vdash^{\supseteq} \Sigma'$ is shown above;
- (2) $\Sigma \subseteq \Sigma'$ since $\Sigma, \overrightarrow{\alpha}^+ \{T\} \subseteq \Sigma'$;
- (3) T; **dom** (Σ') \vdash M is normalized and free from negative algorithmic variables, as shown above:
- (4) $\operatorname{dom}(\Sigma) \cap \operatorname{uv}(M) \subseteq \operatorname{uv}(N)$ since $\operatorname{dom}(\Sigma, \overrightarrow{\alpha^+}\{T\}) \cap \operatorname{uv}(M) \subseteq \operatorname{uv}([\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}]N)$ implies $(\operatorname{dom}(\Sigma) \cup \overrightarrow{\alpha^+}) \cap \operatorname{uv}(M) \subseteq \operatorname{uv}(N) \cup \overrightarrow{\alpha^+}$, thus, $\operatorname{dom}(\Sigma) \cap \operatorname{uv}(M) \subseteq \operatorname{uv}(N) \cup \overrightarrow{\alpha^+}$ and since $\operatorname{dom}(\Sigma)$ is disjoint with $\overrightarrow{\alpha^+}$, $\operatorname{dom}(\Sigma) \cap \operatorname{uv}(M) \subseteq \operatorname{uv}(N)$;
- (5) $\Sigma'|_{\mathbf{uv}(N)\cup\mathbf{uv}(M)} \vdash C|_{\mathbf{uv}(N)\cup\mathbf{uv}(M)}$ follows from $\Sigma'|_{\Upsilon\cup\mathbf{uv}(N)\cup\mathbf{uv}(M)} \vdash C$ if we restrict both sides to $\mathbf{uv}(N)\cup\mathbf{uv}(M)$.
- (6) Let us assume $\Sigma' \vdash \widehat{\sigma} : \mathbf{uv}(N) \cup \mathbf{uv}(M)$ and $\Sigma' \vdash \widehat{\sigma} : C|_{\mathbf{uv}(N) \cup \mathbf{uv}(M)}$. Then to show $T : \Gamma \vdash [\widehat{\sigma}] \forall \alpha^{+}$. $N \bullet \overrightarrow{v} \Rightarrow [\widehat{\sigma}] M$, that is $T : \Gamma \vdash \forall \alpha^{+}$. $[\widehat{\sigma}] N \bullet \overrightarrow{v} \Rightarrow [\widehat{\sigma}] M$, we apply the corresponding declarative rule $(\forall_{\bullet \Rightarrow}^{\mathrm{INF}})$. To do so, we need to provide a substitution for $\overrightarrow{\alpha^{+}}$, i.e. $T \vdash \sigma_{0} : \overrightarrow{\alpha^{+}}$ such that $T : \Gamma \vdash [\sigma_{0}][\widehat{\sigma}] N \bullet \overrightarrow{v} \Rightarrow [\widehat{\sigma}] M$.

By lemma 76, we construct $\widehat{\sigma}_0$ such that $\Sigma' \vdash \widehat{\sigma}_0 : \overrightarrow{\alpha^+}$ and $\Sigma' \vdash \widehat{\sigma}_0 : C|_{\overrightarrow{\alpha^+}}$.

Then σ_0 is defined as $\widehat{\sigma}_0 \circ \widehat{\sigma}|_{\overrightarrow{\alpha}^*} \circ \overrightarrow{\widehat{\alpha}^*}/\overrightarrow{\alpha^*}$.

Let us show that the premises of $(\forall_{\bullet \Longrightarrow}^{INF})$ hold:

- To show $T \vdash \sigma_0 : \overrightarrow{\alpha^+}$, let us take $\alpha_i^+ \in \overrightarrow{\alpha^+}$. If $\widehat{\alpha_i}^+ \in uv(M)$ then $[\sigma_0]\alpha_i^+ = [\widehat{\sigma}]\widehat{\alpha_i}^+$ and $\Sigma' \vdash \widehat{\sigma} : uv(N) \cup uv(M)$ implies $\Sigma'(\widehat{\alpha}^+) \vdash [\widehat{\sigma}]\widehat{\alpha}^+$. Analogously, if $\widehat{\alpha_i}^+ \in \widehat{\alpha}^+ \setminus uv(M)$ then $[\sigma_0]\alpha_i^+ = [\widehat{\sigma}_0]\widehat{\alpha_i}^+$, and $\Sigma' \vdash \widehat{\sigma}_0 : \widehat{\alpha}^+$ implies $\Sigma'(\widehat{\alpha_i}^+) \vdash [\widehat{\sigma}_0]\widehat{\alpha_i}^+$. In any case, $\Sigma'(\widehat{\alpha_i}^+) \vdash [\sigma]\alpha_i^+$ can be weakened to $T \vdash [\sigma_0]\alpha_i^+$, since $T \vdash^2 \Sigma'$.
- Let us show $T : \Gamma \vdash [\sigma_0][\widehat{\sigma}] N \bullet \overrightarrow{v} \implies [\widehat{\sigma}] M$. It suffices to construct $\widehat{\sigma}_1$ such that (a) $\Sigma' \vdash \widehat{\sigma}_1 : \Upsilon \cup \mathbf{uv}(N) \cup \mathbf{uv}(M)$,
 - (b) $\Sigma' \vdash \widehat{\sigma}_1 : C$,
 - (c) $[\sigma_0][\widehat{\sigma}] \underline{N} = [\widehat{\sigma}_1][\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+] \underline{N}$, and
 - (d) $[\widehat{\sigma}]M = [\widehat{\sigma}_1]M$,

because then we can apply the induction hypothesis (3f) to $\widehat{\sigma}_1$, rewrite the conclu-5391 sion by $[\widehat{\sigma}_1][\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}]N = [\sigma_0][\widehat{\sigma}]N$ and $[\widehat{\sigma}_1]M = [\widehat{\sigma}]M$, and infer the required 5392 5393 judgement. 5394 Let us take $\widehat{\sigma}_1 = (\widehat{\sigma}_0 \circ \widehat{\sigma})|_{\Upsilon \cup \mathbf{uv}(N) \cup \mathbf{uv}(M)}$, then 5395 (a) $\Sigma' \vdash \widehat{\sigma}_1 : \Upsilon \cup \mathbf{uv}(\underline{N}) \cup \mathbf{uv}(\underline{M})$, since $\Sigma' \vdash \widehat{\sigma}_0 : \overrightarrow{\widehat{\alpha}^+}$ and $\Sigma' \vdash \widehat{\sigma} : \mathbf{uv}(\underline{N}) \cup \underline{\alpha}$ 5396 $\mathbf{uv}(M)$, we have $\Sigma' \vdash \widehat{\sigma}_0 \circ \widehat{\sigma} : \overrightarrow{\widehat{\alpha}^+} \cup \mathbf{uv}(N) \cup \mathbf{uv}(M)$, which we restrict to 5397 $\Upsilon \cup \mathbf{uv}(N) \cup \mathbf{uv}(M)$. 5398 (b) $\Sigma' \vdash \widehat{\sigma}_1 : C$, Let us take any constraint $e \in C$ restricting variable $\widehat{\beta}^{\pm}$ 5399 $\Sigma'|_{\Upsilon \cup uv(N) \cup uv(M)} \vdash C \text{ implies that } \widehat{\beta}^{\pm} \in \Upsilon \cup uv(N) \cup uv(M).$ 5400 If $\widehat{\beta}^{\pm} \in \mathbf{uv}(N) \cup \mathbf{uv}(M)$ then $[\widehat{\sigma}_1]\widehat{\beta}^{\pm} = [\widehat{\sigma}]\widehat{\beta}^{\pm}$. Additionally, $e \in C|_{\mathbf{uv}(N) \cup \mathbf{uv}(M)}$, which, since $\Sigma' \vdash \widehat{\sigma} : C|_{\mathbf{uv}(N) \cup \mathbf{uv}(M)}$, means $\Sigma'(\widehat{\beta}^{\pm}) \vdash$ 5402 $[\widehat{\sigma}]\widehat{\beta}^{\pm}:e.$ 5404 If $\widehat{\beta}^{\pm} \in \Upsilon \setminus (\mathbf{uv}(N) \cup \mathbf{uv}(M))$ then $[\widehat{\sigma}_1]\widehat{\beta}^{\pm} = [\widehat{\sigma}_0]\widehat{\beta}^{\pm}$. Additionally, $e \in C|_{\overrightarrow{\Rightarrow}}$ 5405 which, since $\Sigma' \vdash \widehat{\sigma}_0 : C|_{\widehat{\sigma}^{\sharp}}$, means $\Sigma'(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_0]\widehat{\beta}^{\pm} : e$. 5406 (c) Let us prove $[\sigma_0][\widehat{\sigma}]N = [\widehat{\sigma}_1][\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+]N$ by the following reasoning 5407 5408 $[\sigma_0][\widehat{\sigma}]N = [\widehat{\sigma}_0][\widehat{\sigma}|_{\overrightarrow{\alpha}}][\overrightarrow{\widehat{\alpha}}^+/\overrightarrow{\alpha}^+][\widehat{\sigma}]N$ by definition of σ_0 5409 5410 $= \left[\widehat{\sigma}_{0}\right]\left[\widehat{\sigma}\right] \Rightarrow \left[\left[\overrightarrow{\alpha}^{+}/\overrightarrow{\alpha}^{+}\right]\right]\left[\widehat{\sigma}\right]_{\mathbf{n}\mathbf{v}}\left(\mathbf{N}\right)\right]\mathbf{N}$ by lemma 55 5411 $\mathbf{u}\mathbf{v}(\mathbf{N}) \cap \overrightarrow{\widehat{\alpha}^+} = \emptyset$ and $\overrightarrow{\alpha^+} \cap T = \emptyset$ $= [\widehat{\sigma}_0][\widehat{\sigma}]_{\overrightarrow{\alpha}}][\widehat{\sigma}|_{\mathbf{nv}(N)}][\overrightarrow{\widehat{\alpha}}^+/\overrightarrow{\alpha}^+]N$ 5412 5413 $= \left[\widehat{\sigma}\right]_{\widehat{\alpha}^{+}} \left[\widehat{\sigma}\right]_{\mathbf{uv}(N)} \left[\overrightarrow{\widehat{\alpha}^{+}}/\overrightarrow{\alpha^{+}}\right] N$ $[\widehat{\sigma}|_{\overrightarrow{\alpha}^+}][\widehat{\sigma}|_{uv(N)}][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N$ is ground 5414 $= \left[\widehat{\sigma}|_{\overrightarrow{\widehat{\alpha}^{+}} \cup \mathbf{uv}(N)}\right] \left[\overrightarrow{\widehat{\alpha}^{+}}/\overrightarrow{\alpha^{+}}\right] N$ 5415 5416 $= [\widehat{\sigma}|_{\Upsilon \cup \mathbf{uv}\,(N)}][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N$ by lemma 55: $\mathbf{uv}\left(\left|\overrightarrow{\alpha}^+\right|/\alpha^+\right|N\right) = \Upsilon \cup \mathbf{uv}\left(N\right)$ 5417 5418 $= \left[\widehat{\sigma}\right]_{\Upsilon \cup \text{nv}(N) \cup \text{nv}(M)} \left[\overrightarrow{\widehat{\alpha}^{+}}/\overrightarrow{\alpha^{+}}\right] N$ also by lemma 55 5419 $\left[\widehat{\sigma}|_{\Upsilon \cup \mathbf{uv}}(N) \cup \mathbf{uv}(M)\right] \left[\overrightarrow{\alpha}^{+}/\overrightarrow{\alpha}^{+}\right] N$ is ground $= \left[(\widehat{\sigma}_0 \circ \widehat{\sigma}) |_{\Upsilon \cup \mathbf{nv}(N) \cup \mathbf{nv}(M)} \right] \left[\overrightarrow{\widehat{\alpha}^+} / \overrightarrow{\alpha^+} \right] N$ 5420 $= [\widehat{\sigma}_1][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N$ by definition of $\widehat{\sigma}_1$ 5422 (d) $[\widehat{\sigma}]M = [\widehat{\sigma}_1]M$ By definition of $\widehat{\sigma}_1$, $[\widehat{\sigma}_1]M$ is equal to 5424 $[(\widehat{\sigma}_0 \circ \widehat{\sigma})|_{\Upsilon \cup \mathbf{uv}}] M$, which by lemma 55 is equal to $[\widehat{\sigma}_0 \circ \widehat{\sigma}] M$, that is $[\widehat{\sigma}_0][\widehat{\sigma}]M$, and since $[\widehat{\sigma}]M$ is ground, $[\widehat{\sigma}_0][\widehat{\sigma}]M = [\widehat{\sigma}]M$. 5426 • $\overrightarrow{\alpha}^+ \neq \cdot$ and $\overrightarrow{v} \neq \cdot$ hold by assumption. 5427 5428 5429 **Lemma 92** (Completeness of Typing). Suppose that $T \vdash \Gamma$. For an inference tree T_1 , 5430 + If T_1 infers $T; \Gamma \vdash \nu : P$ then $T; \Gamma \models \nu : \mathbf{nf}(P)$ 5431 - If T_1 infers $T; \Gamma \vdash c : N$ then $T; \Gamma \models c : \mathbf{nf}(N)$ 5432 • If T_1 infers T; $\Gamma \vdash [\widehat{\sigma}] N \bullet \overrightarrow{v} \Longrightarrow M$ and 5433 (1) $T \vdash^{\supseteq} \Sigma$, 5434 (2) $T \vdash M$, 5435

(3) $T : \mathbf{dom}(\Sigma) \vdash \mathbf{N}$ (free from negative algorithmic variables, that is $\widehat{\alpha}^- \notin \mathbf{uv} \mathbf{N}$), and

5436

5437

5438 5439 (4) $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(N)$,

then there exist M', Σ' , and C such that

(1) $T ; \Gamma ; \Sigma \models \mathbb{N} \bullet \overrightarrow{v} \Longrightarrow M' \not= \Sigma' ; C \text{ and }$

- (2) for any $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(N)$ and $T \vdash M$ such that $T ; \Gamma \vdash [\widehat{\sigma}] N \bullet \overrightarrow{v} \implies M$, there exists $\widehat{\sigma}'$ such that
 - (a) $\Sigma' \vdash \widehat{\sigma}' : \mathbf{uv} \ \mathbf{N} \cup \mathbf{uv} \ \mathbf{M} \ and \ \Sigma' \vdash \widehat{\sigma}' : C$,
 - (b) $\Sigma \vdash \widehat{\sigma}' \simeq \widehat{\sigma} : \mathbf{uv} \mathbb{N}$, and
 - (c) $T \vdash [\widehat{\sigma}'] \underline{M}' \simeq^{\leq} M$.

PROOF. We prove it by induction on metric (T_1) , mutually with the soundness of typing (lemma 91) Let us consider the last rule applied to infer the derivation.

Case 1. $(\{\}^{INF})$

Then we are proving that if $T; \Gamma \vdash \{c\} : \downarrow N$ (inferred by $(\{\}^{\text{INF}})$) then $T; \Gamma \vdash \{c\} : \mathbf{nf}(\downarrow N)$. By inversion of $T; \Gamma \vdash \{c\} : \downarrow N$, we have $T; \Gamma \vdash c : N$, which we apply the induction hypothesis to to obtain $T; \Gamma \vdash c : \mathbf{nf}(N)$. Then by $(\{\}^{\text{INF}})$, we have $T; \Gamma \vdash \{c\} : \downarrow \mathbf{nf}(N)$. It is left to notice that $\downarrow \mathbf{nf}(N) = \mathbf{nf}(\downarrow N)$.

Case 2. (RET^{INF})

The proof is symmetric to the previous case (case 1).

Case 3. (ANN_{+}^{INF})

Then we are proving that if $T; \Gamma \vdash (\nu : Q) : Q$ is inferred by (ANN_+^{INF}) then $T; \Gamma \models (\nu Q) : \mathbf{nf}(Q)$. By inversion, we have:

- (1) $T \vdash Q$;
- (2) $T; \Gamma \vdash \nu : P$, which by the induction hypothesis implies $T; \Gamma \models \nu : \mathbf{nf}(P)$;
- (3) $T \vdash Q \geqslant P$, and by transitivity, $T \vdash Q \geqslant \mathbf{nf}(P)$; Since Q is ground, we have $T : \vdash Q$ and $T \vdash [\cdot] Q \geqslant \mathbf{nf}(P)$. Then by the completeness of subtyping (lemma 79), we have $T : \vdash Q \geqslant \mathbf{nf}(P) = C$, where $\cdot \vdash C$ (implying $C = \cdot$). This way, $T : \vdash Q \geqslant \mathbf{nf}(P) = C$.

Then we can apply (ANN_+^{INF}) to $T \vdash Q$, $T; \Gamma \models \nu : \mathbf{nf}(P)$ and $T; \cdot \models Q \geqslant \mathbf{nf}(P) \dashv \cdot$ to infer $T; \Gamma \models (\nu : Q) : \mathbf{nf}(Q)$.

Case 4. (ANN_)

The proof is symmetric to the previous case (case 3).

Case 5. (λ^{INF})

Then we are proving that if T; $\Gamma \vdash \lambda x : P$. $c : P \to N$ is inferred by (λ^{INF}) , then T; $\Gamma \models \lambda x$ P. $c : \text{nf}(P \to N)$.

By inversion of T; $\Gamma \vdash \lambda x : P$. $c : P \to N$, we have $T \vdash P$ and T; $\Gamma, x : P \vdash c : N$. Then by the induction hypothesis, T; $\Gamma, x : P \models c : \mathbf{nf}(N)$. By (λ^{INF}) , we infer T; $\Gamma \models \lambda x : P$. $c : \mathbf{nf}(P \to \mathbf{nf}(N))$. By idempotence of normalization (lemma 44), $\mathbf{nf}(P \to \mathbf{nf}(N)) = \mathbf{nf}(P \to N)$, which concludes the proof for this case.

Case 6. (Λ^{INF})

Then we are proving that if $T; \Gamma \vdash \Lambda \alpha^+$. $c : \forall \alpha^+$. N is inferred by (Λ^{INF}) , then $T; \Gamma \vdash \Lambda \alpha^+$. $c : \text{nf}(\forall \alpha^+, N)$. Similar to the previous case, by inversion of $T; \Gamma \vdash \Lambda \alpha^+$. $c : \forall \alpha^+, N$, we have $T, \alpha^+; \Gamma \vdash c : N$, and then by the induction hypothesis, $T, \alpha^+; \Gamma \vdash c : \text{nf}(N)$. After that, application of (Λ^{INF}) , gives as $T; \Gamma \vdash \Lambda \alpha^+$. $c : \text{nf}(\forall \alpha^+, \text{nf}(N))$.

It is left to show that $\mathbf{nf}(\forall \alpha^+$. $\mathbf{nf}(N)) = \mathbf{nf}(\forall \alpha^+$. N). Assume $N = \forall \overrightarrow{\beta^+}$. M (where M does not start with \forall).

- Then by definition, $\operatorname{nf}(\forall \alpha^+, N) = \operatorname{nf}(\forall \alpha^+, \overrightarrow{\beta^+}, M) = \forall \overrightarrow{\gamma^+}, \operatorname{nf}(M)$, where $\operatorname{ord} \alpha^+, \overrightarrow{\beta^+} \operatorname{in} \operatorname{nf}(M) = \overrightarrow{\gamma^+}$.
- On the other hand, $\operatorname{nf}(N) = \forall \overrightarrow{\gamma^{+}}'$. $\operatorname{nf}(M)$, where $\operatorname{ord} \overrightarrow{\beta^{+}} \operatorname{in} \operatorname{nf}(M) = \overrightarrow{\gamma^{+}}'$, and thus $\operatorname{nf}(\forall \alpha^{+}, \operatorname{nf}(N)) = \operatorname{nf}(\forall \alpha^{+}, \overrightarrow{\gamma^{+}}' \operatorname{nf}(M)) = \forall \overrightarrow{\gamma^{+}}''$. $\operatorname{nf}(\operatorname{nf}(M)) = \forall \overrightarrow{\gamma^{+}}'' \operatorname{nf}(\operatorname{nf}(M)) = \overrightarrow{\gamma^{+}}''$.

```
It is left to show that y^{+}'' = y^{+}.
\overrightarrow{v}^{+\prime\prime} = \operatorname{ord} \alpha^{+}, \overrightarrow{v}^{+\prime} \text{ in nf (nf (M))}
             = ord \alpha^+, \overrightarrow{v}^+ in nf (M)
                                                                                                                                                                               by idempotence (lemma 44)
             = \operatorname{ord} \alpha^+ \cup \overrightarrow{\beta^+} \cap \operatorname{fv} \operatorname{nf} (M) \operatorname{in} \operatorname{nf} (M)
                                                                                                                                                                               by definition of \overrightarrow{y}^{+\prime} and lemma 33
             = ord (\alpha^+ \cup \overrightarrow{\beta^+} \cap \text{fv nf } (M)) \cap \text{fv nf } (M) \text{ in nf } (M)
                                                                                                                                                                             by lemma 34
             = ord (\alpha^+ \cup \overrightarrow{\beta^+}) \cap \text{fv nf } (M) \text{ in nf } (M)
                                                                                                                                                                               by set properties
             = ord \alpha^+, \overrightarrow{\beta^+} in nf (M)
             =\overrightarrow{v}^{+}
         Case 7. (LET INF)
               Then we are proving that if T; \Gamma \vdash \mathbf{let}^{\exists}(\overrightarrow{\alpha}, x) = v; c : N is inferred by (LET; ), then
                 T; \Gamma \models \mathbf{let}^{\exists}(\overrightarrow{\alpha}, x) = v; c: \mathbf{nf}(N).
                By inversion of T; \Gamma \vdash \mathbf{let}^{\exists}(\overrightarrow{\alpha}, x) = v; c : N, we have
                  (1) \operatorname{nf}(\exists \overrightarrow{\alpha}^{-}. P) = \exists \overrightarrow{\alpha}^{-}. P,
                  (2) T; \Gamma \vdash \nu : \exists \overrightarrow{\alpha}^{-}. P, which by the induction hypothesis implies T; \Gamma \vDash \nu : \mathbf{nf} (\exists \overrightarrow{\alpha}^{-}. P), and
                              hence, T; \Gamma \models \nu : \exists \overline{\alpha}. P.
                   (3) T, \overrightarrow{\alpha}; \Gamma, x : P \vdash c : N, and by the induction hypothesis, T, \overrightarrow{\alpha}; \Gamma, x : P \models c : \mathbf{nf}(N).
                   (4) T \vdash N.
               This way, we can apply (LET ^{\text{INF}}_{\exists}) to infer T; \Gamma \models \text{let}^{\exists}(\overrightarrow{\alpha}, x) = v; c: \text{nf}(N).
         Case 8. (\simeq_{\perp}^{INF})
                Then we are proving that if T; \Gamma \vdash \nu : P' is inferred by (\simeq_{+}^{\text{INF}}), then T; \Gamma \models \nu : \text{nf}(P'). By
                inversion, T; \Gamma \vdash \nu : P and T \vdash P \simeq^{\leq} P', and the metric of the tree inferring T; \Gamma \vdash \nu : P is
                less than the one inferring T; \Gamma \vdash \nu : P'. Then by the induction hypothesis, T; \Gamma \models \nu : \mathbf{nf}(P)
                By lemma 46 T \vdash P \simeq P' implies \operatorname{nf}(P) = \operatorname{nf}(P'), and thus, T; \Gamma \models v : \operatorname{nf}(P) can be
                rewritten to T; \Gamma \models \nu: nf (P').
         Case 9. (VAR<sup>INF</sup>)
                Then we are proving that T; \Gamma \vdash x : P implies T; \Gamma \vdash x : nf(P). By inversion of T; \Gamma \vdash x : P
                we have x : P \in \Gamma. Then (VAR<sup>INF</sup>) applies to infer T; \Gamma \models x : \mathbf{nf}(P).
         Case 10. (LET<sup>INF</sup>)
                Then we are proving that T; \Gamma \vdash \text{let } x = v(\overrightarrow{v}); c : N \text{ implies } T; \Gamma \vdash \text{let } x = v(\overrightarrow{v}); c : \text{nf } (N)
                By inversion of T; \Gamma \vdash \mathbf{let} \ x = v(\overrightarrow{v}); c \colon N, we have
                  (1) T; \Gamma \vdash \nu : P, and by the induction hypothesis, T; \Gamma \models \nu : \mathbf{nf}(P).
                  (2) T; \Gamma, x : P \vdash c : N, and by lemma 48, since T \vdash P \simeq^{\leq} \mathbf{nf}(P), we have T; \Gamma, x : \mathbf{nf}(P) \vdash
                               c: N. Then by the induction hypothesis, T; \Gamma, x : \mathbf{nf}(P) \models c: \mathbf{nf}(N).
                Together, T; \Gamma \models \nu : \mathbf{nf}(P) and T; \Gamma, x : \mathbf{nf}(P) \models c : \mathbf{nf}(N) imply T; \Gamma \models \mathbf{let} x = \nu(\vec{v})
                 c : \mathbf{nf}(N) by (Let<sup>inf</sup>).
        Case 11. (LET<sup>INF</sup><sub>:@</sub>)
                Then we are proving that T; \Gamma \vdash \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ implies } T; \Gamma \models \text{let } x : P = v(\vec{v}) ; c : N \text{ i
                 v(\overrightarrow{v}); c: nf (N).
                By inversion of T; \Gamma \vdash \mathbf{let} \ x : P = v(\overrightarrow{v}); c : N, we have
                  (1) T \vdash P
                   (2) T; \Gamma \vdash \nu : \downarrow M for some ground M, which by the induction hypothesis means T; \Gamma \models
```

```
(3) T : \Gamma \vdash M \bullet \overrightarrow{v} \implies \uparrow \bigcirc. By lemma 49, since T \vdash M \simeq \inf(M), we have T : \Gamma \vdash M \cong \inf(M)
                                [\cdot] nf (M) \bullet \vec{v} \implies \uparrow Q, which by the induction hypothesis means that there exist
5539
5540
                                normalized M', \Sigma, and C_1 such that (noting that M is ground):
                                   (a) T; \Gamma; \cdot \models \mathbf{nf}(M) \bullet \overrightarrow{v} \implies M' \neq \Sigma; C_1, where by the soundness, T; \mathbf{dom}(\Sigma) \vdash M'
5541
                                          and \Sigma \vdash C_1.
5542
                                   (b) for any T \vdash M'' such that T : \Gamma \vdash \mathbf{nf}(M) \bullet \overrightarrow{v} \implies M'' there exists \widehat{\sigma} such that
5543
5544
                                            (i) \Sigma \vdash \widehat{\sigma} : \mathbf{uv} \ \mathbf{M}', \Sigma \vdash \widehat{\sigma} : C_1, and
5545
                                           (ii) T \vdash [\widehat{\sigma}] \underline{M}' \simeq^{\leqslant} \underline{M}'',
                                          In particular, there exists \widehat{\sigma}_0 such that \Sigma \vdash \widehat{\sigma}_0 : \mathbf{uv} M', \Sigma \vdash \widehat{\sigma}_0 : C_1, T \vdash [\widehat{\sigma}_0] M' \simeq^{\leq}
5546
                                           \uparrow Q. Since M' is normalized and free of negative algorithmic variables, the latter
5547
                                          equivalence means M' = \uparrow Q_0 for some Q_0, and T \vdash [\widehat{\sigma}_0] Q_0 \simeq^{\leqslant} Q.
5548
                         (4) T \vdash \uparrow Q \leqslant \uparrow P, and by transitivity, since T \vdash [\widehat{\sigma}_0] \uparrow Q_0 \simeq^{\leqslant} \uparrow Q, we have T \vdash [\widehat{\sigma}_0] \uparrow Q_0 \leqslant \uparrow P
5549
5550
                               Let us apply lemma 85 to T \vdash [\widehat{\sigma}_0] \uparrow Q_0 \leq \uparrow P and obtain \Sigma \vdash C_2 such that
                                   (a) T; \Sigma \models \uparrow Q_0 \leqslant \uparrow P = C_2 and
5551
                                   (b) \Sigma \vdash \widehat{\sigma}_0 : C_2.
5552
                         (5) T; \Gamma, x : P \vdash c : N, and by the induction hypothesis, T; \Gamma, x : P \models c : \mathbf{nf}(N).
5553
                       To infer T; \Gamma \models \text{let } x : P = v(\overrightarrow{v}); c : \text{nf } (N), we apply the corresponding algorithmic rule
5554
                       (LET_{\cdot \bigcirc}^{\text{INF}}). Let us show that the premises hold:
5555
5556
                         (1) T \vdash P,
5557
                         (2) T; \Gamma \models \nu : \downarrow \mathbf{nf}(M),
                         (3) T : \Gamma : \vdash \mathbf{nf}(M) \bullet \overrightarrow{v} \Longrightarrow \uparrow Q_0 = \Sigma : C_1,
5558
5559
                         (4) T; \Sigma \models \uparrow Q_0 \leqslant \uparrow P = C_2, and
5560
                         (5) T; \Gamma, x : P \models c: nf (N) hold as noted above;
                         (6) \Sigma \vdash C_1 \& C_2 = C is defined by lemma 83, since \Sigma \vdash \widehat{\sigma}_0 : C_1 and \Sigma \vdash \widehat{\sigma}_0 : C_2.
5561
                   Case 12. (LET (INF)
5562
                        By assumption, c is let x = v(\vec{v}); c'. Then by inversion of T; \Gamma \vdash \text{let } x = v(\vec{v}); c': N:
5563
5564
                           • T; \Gamma \vdash \nu : \downarrow M, which by the induction hypothesis means T; \Gamma \models \nu : \downarrow \mathbf{nf}(M);
5565
                           • T; \Gamma \vdash M \bullet \overrightarrow{v} \implies \uparrow Q unique. Then by lemma 49, since T \vdash M \simeq^{\varsigma} \mathbf{nf}(M), we have
                               T : \Gamma \vdash \mathbf{nf}(M) \bullet \overrightarrow{v} \implies \uparrow Q and moreover, T : \Gamma \vdash \mathbf{nf}(M) \bullet \overrightarrow{v} \implies \uparrow Q unique (since
5566
5567
                                symmetrically, \mathbf{nf}(M) can be replaced back by M). Then the induction hypothesis
5568
                               applied to T : \Gamma \vdash [\cdot] \mathbf{nf}(M) \bullet \overrightarrow{v} \Longrightarrow \uparrow Q implies that there exist M', \Sigma, and C such that
5569
                               (considering M is ground):
                                   (1) T : \Gamma : \vdash \mathbf{nf}(M) \bullet \overrightarrow{v} \implies M' = \Sigma : C, which, by the soundness, implies, in
5570
5571
                                          particular that
5572
                                            (a) T; dom (\Sigma) \vdash M' is normalized and free of negative algorithmic variables,
5573
                                           (b) \Sigma|_{\mathbf{uv}(M')} \vdash C, which means \mathbf{dom}(C) \subseteq \mathbf{uv}(M'),
5574
                                            (c) for any \Sigma \vdash \widehat{\sigma} : \mathbf{uv} M' such that \Sigma \vdash \widehat{\sigma} : C, we have T : \Gamma \vdash \mathbf{nf} (M) \bullet
                                                  \vec{v} \implies [\widehat{\sigma}] M', which, since T : \Gamma \vdash \mathbf{nf}(M) \bullet \vec{v} \implies \mathcal{O} unique, means
5575
5576
                                                  T \vdash [\widehat{\sigma}] M' \simeq^{\leq} \uparrow Q.
5577
                                          and
                                   (2) for any T \vdash M'' such that T ; \Gamma \vdash \mathbf{nf}(M) \bullet \overrightarrow{v} \implies M'', (and in particular, for
5578
                                          T \vdash \uparrow Q) there exists \widehat{\sigma}_1 such that
5579
                                           (a) \Sigma \vdash \widehat{\sigma}_1 : \mathbf{uv} M', \Sigma \vdash \widehat{\sigma}_1 : C, and
5580
                                           (b) T + [\widehat{\sigma}_1]M' \simeq^{\leqslant} M'', and in particular, T + [\widehat{\sigma}_1]M' \simeq^{\leqslant} \uparrow Q. Since M' is
5581
                                                  normalized and free of negative algorithmic variables, it means that M' = \uparrow P
5582
                                                  for some P(T; \mathbf{dom}(\Sigma) \vdash P) that is T \vdash [\widehat{\sigma}_1]P \simeq^{\leq} Q.
5583
                           • T; \Gamma, x : Q \vdash c' : N
5584
5586
```

To infer T; $\Gamma \models \mathbf{let} \ x = \nu(\overrightarrow{v}) \ ; \ c' : \mathbf{nf} \ (N)$, let us apply the corresponding algorithmic rule $((\mathtt{LET}^{\mathtt{INF}}_{\widehat{o}}))$:

- (1) T; $\Gamma \models v$: $\downarrow \mathbf{nf}(M)$ holds as noted above;
- (2) $T : \Gamma : \vdash \mathbf{nf}(M) \bullet \overrightarrow{v} \Longrightarrow \uparrow P = \Sigma : C$ holds as noted above:
- (3) To show $\mathbf{uv} P = \mathbf{dom}(C)$ and C singular with $\widehat{\sigma}_0$ for some $\widehat{\sigma}_0$, we apply lemma 89 with $\Upsilon = \mathbf{uv} P = \mathbf{uv}(M')$ (as noted above, $\mathbf{dom}(C) \subseteq \mathbf{uv}(M') = \Upsilon$).

Now we will show that any substitution satisfying C is equivalent to $\widehat{\sigma}_1$. As noted in 1c for any substitution $\Sigma \vdash \widehat{\sigma} : \Upsilon, \Sigma \vdash \widehat{\sigma} : C$ implies $T \vdash [\widehat{\sigma}] M' \simeq^{\varsigma} \uparrow Q$, which is rewritten as $T \vdash [\widehat{\sigma}] P \simeq^{\varsigma} Q$. And since $T \vdash [\widehat{\sigma}_1] P \simeq^{\varsigma} Q$, we have $T \vdash [\widehat{\sigma}] P \simeq^{\varsigma} [\widehat{\sigma}_1] P$, which implies $\Sigma \vdash \widehat{\sigma} \simeq^{\varsigma} \widehat{\sigma}_1 : \Upsilon$ by corollary 23.

(4) Let us show $T; \Gamma, x : [\widehat{\sigma}_0] P \models c' : \mathbf{nf}(N)$. By the soundness of singularity (lemma 88), we have $\Sigma \vdash \widehat{\sigma}_0 : C$, which by 1c means $T \vdash [\widehat{\sigma}_0] M' \simeq^{<} \uparrow Q$, that is $T \vdash [\widehat{\sigma}_0] P \simeq^{<} Q$, and thus, $T \vdash \Gamma, x : Q \simeq^{<} \Gamma, x : [\widehat{\sigma}_0] P$.

Then by lemma 48, T; Γ , $x : Q \vdash c' : N$ can be rewritten as T; Γ , $x : [\widehat{\sigma}_0]P \vdash c' : N$. Then by the induction hypothesis applied to it, T; Γ , $x : [\widehat{\sigma}_0]P \models c' : \mathbf{nf}(N)$ holds.

Case 13. (∀_{•⇒}^{INF})

5631

5632

5633

5634 5635 Since N cannot be a algorithmic variable, if $[\widehat{\sigma}]N$ starts with \forall , so does N. This way, $N = \forall \alpha^+$. N_1 . Then by assumption:

- (1) $T \vdash^{\supseteq} \Sigma$
- (2) T; $\operatorname{dom}(\Sigma) \vdash \forall \alpha^{+}$. N_{1} is free from negative algorithmic variables, and then T, α^{+} $\operatorname{dom}(\Sigma) \vdash N_{1}$ is free from negative algorithmic variables too;
- (3) $\Sigma \vdash \widehat{\sigma} : \mathbf{uv} \ \mathbf{N}_1;$
- (4) $T \vdash M$;
- (5) $T : \Gamma \vdash [\widehat{\sigma}] \forall \overrightarrow{\alpha^+}. N_1 \bullet \overrightarrow{v} \implies M$, that is $T : \Gamma \vdash (\forall \overrightarrow{\alpha^+}. [\widehat{\sigma}] N_1) \bullet \overrightarrow{v} \implies M$. Then by inversion there exists σ such that
 - (a) $T \vdash \sigma : \alpha^{+}$;
 - (b) $\overrightarrow{v} \neq \cdot$ and $\overrightarrow{\alpha^+} \neq \cdot$; and
 - (c) $T; \Gamma \vdash [\sigma][\widehat{\sigma}] N_1 \bullet \overrightarrow{v} \implies M$. Notice that σ and $\widehat{\sigma}$ commute because the codomain of σ does not contain algorithmic variables (and thus, does not intersect with the domain of $\widehat{\sigma}$), and the codomain of $\widehat{\sigma}$ is T and does not intersect with $\overrightarrow{\alpha^+}$ —the domain of σ .

Let us take fresh $\widehat{\alpha}^+$ and construct $N_0 = [\widehat{\alpha}^+/\widehat{\alpha}^+]N_1$ and $\Sigma, \widehat{\alpha}^+\{T\} \vdash \widehat{\sigma}_0 : \mathbf{uv}(N_0)$ defined as

$$\begin{cases} [\widehat{\sigma}_0] \widehat{\alpha}_i^+ = [\sigma] \alpha_i^+ & \text{for } \widehat{\alpha}_i^+ \in \overrightarrow{\widehat{\alpha}}^+ \cap \mathbf{uv} \ \mathbf{N}_0 \\ [\widehat{\sigma}_0] \widehat{\beta}^{\pm} = [\widehat{\sigma}] \widehat{\beta}^{\pm} & \text{for } \widehat{\beta}^{\pm} \in \mathbf{uv} \ \mathbf{N}_1 \end{cases}$$

Then it is easy to see that $[\widehat{\sigma}_0][\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+]N_1 = [\sigma][\widehat{\sigma}]N_1$ because this substitution compositions coincide on $\mathbf{uv}(N_1) \cup \mathbf{fv}(N_1)$. In other words, $[\widehat{\sigma}_0]N_0 = [\sigma][\widehat{\sigma}]N_1$.

Then let us apply the induction hypothesis to T; $\Gamma \vdash [\widehat{\sigma}_0] N_0 \bullet \overrightarrow{v} \implies M$ and obtain M', Σ' , and C such that

- $T ; \Gamma ; \Sigma, \overrightarrow{\alpha}^+ \{T\} \models N_0 \bullet \overrightarrow{v} \Longrightarrow M' \ni \Sigma' ; C \text{ and }$
- for any Σ , $\overrightarrow{\alpha}^+\{T\} \vdash \widehat{\sigma}_0 : \mathbf{uv}(N_0)$ and $T \vdash M$ such that $T ; \Gamma \vdash [\widehat{\sigma}_0] N_0 \bullet \overrightarrow{v} \Rightarrow M$, there exists $\widehat{\sigma}_0'$ such that
 - (i) $\Sigma' \vdash \widehat{\sigma}'_0 : \mathbf{uv}(N_0) \cup \mathbf{uv}(M'), \Sigma' \vdash \widehat{\sigma}'_0 : C$,
- (ii) $\Sigma, \overrightarrow{\alpha}^+ \{T\} \vdash \widehat{\sigma}'_0 \simeq^{\leqslant} \widehat{\sigma}_0 : \mathbf{uv} \ N_0$, and

(iii) $T \vdash [\widehat{\sigma}'_0] \underline{M}' \simeq^{\leqslant} M$.

Let us take \underline{M}' , Σ' , and C from the induction hypothesis (5c) (from C we subtract entries restricting \overrightarrow{a}^+) and show they satisfy the required properties

- (1) To infer T; Γ ; $\Sigma \models \forall \overrightarrow{\alpha^+}$. $N_1 \bullet \overrightarrow{v} \implies M' \ni \Sigma'$; $C \setminus \overrightarrow{\alpha^+}$ we apply the corresponding algorithmic rule $(\forall_{\bullet \Longrightarrow}^{\text{INF}})$. As noted above, the required premises hold:
 - (a) $\overrightarrow{v} \neq \cdot, \overrightarrow{\alpha^+} \neq \cdot$; and
 - (b) $T : \Gamma : \Sigma, \overrightarrow{\alpha}^+ \{T\} \models [\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+] N_1 \bullet \overrightarrow{v} \implies M' \dashv \Sigma' : C$ is obtained by unfolding the definition of N_0 in $T : \Gamma : \Sigma, \overrightarrow{\alpha}^+ \{T\} \models N_0 \bullet \overrightarrow{v} \implies M' \dashv \Sigma' : C$ (5c).
- (2) Let us take and arbitrary $\Sigma \vdash \widehat{\sigma} : \mathbf{uv} \ N_1$ and $T \vdash M$ and assume $T; \Gamma \vdash [\widehat{\sigma}] \forall \overrightarrow{\alpha^+}. \ N_1 \bullet \overrightarrow{v} \Rightarrow M$. Then the same reasoning as in 5c applies. In particular, we construct $\Sigma, \overrightarrow{\alpha^+} \{T\} \vdash \widehat{\sigma}_0 : \mathbf{uv} \ (N_0)$ as an extension of $\widehat{\sigma}$ and obtain $T; \Gamma \vdash [\widehat{\sigma}_0] \ N_0 \bullet \overrightarrow{v} \Rightarrow M$. It means we can apply the property inferred from the induction hypothesis (5c) to obtain $\widehat{\sigma}'_0$ such that
 - (a) $\Sigma' \vdash \widehat{\sigma}'_0 : \mathbf{uv}(N_0) \cup \mathbf{uv}(M')$ and $\Sigma' \vdash \widehat{\sigma}'_0 : C$,
 - (b) $\Sigma, \overrightarrow{\widehat{\alpha}^+} \{T\} \vdash \widehat{\sigma}'_0 \simeq^{\leqslant} \widehat{\sigma}_0 : \mathbf{uv} \, \mathbf{N}_0$, and
 - (c) $T \vdash [\widehat{\sigma}'_0] \underline{M}' \simeq^{\leqslant} M$.

Let us show that $\widehat{\sigma}_0'|_{(\mathbf{uv}(N_1)\cup\mathbf{uv}(M'))}$ satisfies the required properties.

- (a) $\Sigma' \vdash \widehat{\sigma'_0}|_{(\mathbf{uv}(N_1) \cup \mathbf{uv}(M'))} : (\mathbf{uv}(N_1) \cup \mathbf{uv}(M')) \text{ holds since } \Sigma' \vdash \widehat{\sigma'_0} : \mathbf{uv}(N_0) \cup \mathbf{uv}(M') \text{ and } \mathbf{uv}(N_1) \cup \mathbf{uv}(M') \subseteq \mathbf{uv}(N_0) \cup \mathbf{uv}(M'); \Sigma' \vdash \widehat{\sigma'_0}|_{(\mathbf{uv}(N_1) \cup \mathbf{uv}(M'))} \subset \backslash \overrightarrow{\alpha^+} \text{ holds since } \Sigma' \vdash \widehat{\sigma'_0} : C, \Sigma' \vdash \widehat{\sigma'_0} : \mathbf{uv}(N_0) \cup \mathbf{uv}(M'), \text{ and } (\mathbf{uv}(N_0) \cup \mathbf{uv}(M')) \backslash \overrightarrow{\alpha^+} = \mathbf{uv}(N_1) \cup \mathbf{uv}(M').$
- (b) $T \vdash [\widehat{\sigma}'_0] \underline{M'} \simeq M$ holds as shown, and hence it holds for $\widehat{\sigma}'_0|_{(\mathbf{uv}(N_1) \cup \mathbf{uv}(\underline{M'}))}$;
- (c) We show $\Sigma \vdash \widehat{\sigma}'_0 \simeq^{\leq} \widehat{\sigma} : \mathbf{uv} \ \mathbf{N}_1$, from which it follows that it holds for $\widehat{\sigma}'_0|_{(\mathbf{uv} \ (\mathbf{N}_1) \cup \mathbf{uv} \ (\mathbf{M}'))}$. Let us take an arbitrary $\widehat{\beta}^{\pm} \in \mathbf{dom} \ (\Sigma) \subseteq \mathbf{dom} \ (\Sigma) \cup \widehat{\alpha}^{\pm}$. Then since $\Sigma, \widehat{\alpha}^{\pm} \{T\} \vdash \widehat{\sigma}'_0 \simeq^{\leq} \widehat{\sigma}_0 : \mathbf{uv} \ \mathbf{N}_0$, we have $\Sigma(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}'_0] \widehat{\beta}^{\pm} \simeq^{\leq} [\widehat{\sigma}_0] \widehat{\beta}^{\pm}$ and by definition of $\widehat{\sigma}_0$, $[\widehat{\sigma}_0] \widehat{\beta}^{\pm} = [\widehat{\sigma}] \widehat{\beta}^{\pm}$.

Case 14. $(\rightarrow_{\bullet \Rightarrow}^{INF})$

Since N cannot be a algorithmic variable, if the shape of $[\widehat{\sigma}]N$ is an arrow, so is the shape of N. This way, $N = Q \rightarrow N_1$. Then by assumption:

- (1) $T \vdash^{\supseteq} \Sigma$;
- (2) T; **dom** (Σ) $\vdash Q \rightarrow N_1$ is free from negative algorithmic variables;
- (3) $\Sigma \vdash \widehat{\sigma} : \mathbf{uv} \ \underline{Q} \cup \mathbf{uv} \ \underline{N}_1;$
- (4) $T \vdash M$;
- (5) $T : \Gamma \vdash [\widehat{\sigma}](Q \to N_1) \bullet v, \overrightarrow{v} \Longrightarrow M$, that is $T : \Gamma \vdash ([\widehat{\sigma}]Q \to [\widehat{\sigma}]N_1) \bullet v, \overrightarrow{v} \Longrightarrow M$ and by inversion:
 - (a) $T; \Gamma \vdash \nu : P$, and by the induction hypothesis, $T; \Gamma \models \nu : \mathbf{nf}(P)$;

 - (c) $T : \Gamma \vdash [\widehat{\sigma}] \underbrace{N_1 \bullet \overrightarrow{v}} \implies M$. Notice that the induction hypothesis is applicable to this case: $T : \mathbf{dom}(\Sigma) \vdash N_1$ is free from negative algorithmic variables because so is $Q \rightarrow N_1$. This way, there exist M', Σ' , and C_2 such that
 - (i) T; Γ ; $\Sigma \models N_1 \bullet \overrightarrow{v} \implies M' = \Sigma'$; C_2 and then by soundness of typing (i.e. the induction hypothesis),
 - (A) $\Sigma \subseteq \Sigma'$

```
(B) T : \mathbf{dom}(\Sigma') \vdash M'
5685
                                                       (C) \operatorname{dom}(\Sigma) \cap \operatorname{uv}(M') \subseteq \operatorname{uv} N_1
5686
                                                       (D) \Sigma'|_{\mathbf{uv} N_1 \cup \mathbf{uv} M'} \vdash C_2
5687
                                                  (ii) for any \Sigma \vdash \widehat{\sigma} : \mathbf{uv}(N_1) and T \vdash M such that T ; \Gamma \vdash [\widehat{\sigma}] N_1 \bullet \overrightarrow{v} \implies M
5688
                                                           there exists \widehat{\sigma}' such that
5689
                                                       (A) \Sigma' \vdash \widehat{\sigma}' : \mathbf{uv}(N_1) \cup \mathbf{uv}(M') and \Sigma' \vdash \widehat{\sigma}' : C_2,
5690
                                                       (B) \Sigma \vdash \widehat{\sigma}' \simeq \widehat{\sigma} : \mathbf{uv}(N_1), and
5691
                                                       (C) T \vdash [\widehat{\sigma}'] M' \simeq^{\leq} M.
5692
                           We need to show that there exist M', \Sigma', and C such that T; \Gamma; \Sigma \models \mathbb{Q} \rightarrow \mathbb{N}_1 \bullet \nu, \overrightarrow{v} \Rightarrow
5693
                            M' = \Sigma'; C and the initiality property holds. We take M' and \Sigma' from the induction
5694
                           hypothesis (5c), and C as a merge of C_1 and C_2. To show that \Sigma' \vdash C_1 \& C_2 = C exists, we
5695
                            apply lemma 83. To do so, we need to provide a substitution satisfying both C_1 and C_2.
5696
                            Notice that \operatorname{dom}(C_1) = \operatorname{uv}(Q) and \operatorname{dom}(C_2) \subseteq \operatorname{uv} N_1 \cup \operatorname{uv} M'. This way, it suffices to
5697
                            construct \Sigma' \vdash \widehat{\sigma}'' : \mathbf{uv}(Q) \cup \mathbf{uv} N_1 \cup \mathbf{uv} M' such that \Sigma' \vdash \widehat{\sigma}'' : C_1 and \Sigma' \vdash \widehat{\sigma}'' : C_2.
5698
                           By the induction hypothesis (5(c)ii), \widehat{\sigma}|_{\mathbf{uv}(N_1)} can be extended to \widehat{\sigma}' such that
5699
                             (1) \Sigma' \vdash \widehat{\sigma}' : \mathbf{uv}(N_1) \cup \mathbf{uv}(M') and \Sigma' \vdash \widehat{\sigma}' : C_2,
5700
                             (2) \Sigma \vdash \widehat{\sigma}' \simeq \widehat{\sigma} : \mathbf{uv}(N_1), and
5701
5702
                             (3) T \vdash [\widehat{\sigma}']M' \simeq^{\leq} M.
                           Let us extend \widehat{\sigma}' to \widehat{\sigma}'' defined on \mathbf{uv}(Q) \cup \mathbf{uv}(N_1) \cup \mathbf{uv}(M') with values of \widehat{\sigma} as follows
                                                 \begin{cases} [\widehat{\sigma}''] \widehat{\beta}^{\pm} = [\widehat{\sigma}'] \widehat{\beta}^{\pm} & \text{for } \widehat{\beta}^{\pm} \in \mathbf{uv} (N_1) \cup \mathbf{uv} (M') \\ [\widehat{\sigma}''] \widehat{\gamma}^{\pm} = [\widehat{\sigma}] \widehat{\gamma}^{\pm} & \text{for } \widehat{\gamma}^{\pm} \in \mathbf{uv} (\begin{subarray}{c} \mathbf{\mathcal{Q}} \\ \mathbf{\mathcal{Q}} \end{subarray}) \setminus (\mathbf{uv} (N_1) \cup \mathbf{uv} (M')) \end{cases}
                           First, notice that \Sigma' \vdash \widehat{\sigma}'' \simeq \widehat{\sigma}' : \mathbf{uv}(N_1) \cup \mathbf{uv}(M') by definition. Then since \Sigma' \vdash \widehat{\sigma}' : C_2
                            and \Sigma' \vdash C_2 : \mathbf{uv}(N_1) \cup \mathbf{uv}(M'), we have \Sigma' \vdash \widehat{\sigma}'' : C_2.
                           Second, notice that \Sigma \vdash \widehat{\sigma}'' \simeq \widehat{\sigma} : \mathbf{uv}(N_1) \cup \mathbf{uv}(Q):
5710
                                • if \widehat{\gamma}^{\pm} \in uv(\mathcal{O}) \setminus (uv(N_1) \cup uv(M')) then [\widehat{\sigma}'']\widehat{\gamma}^{\pm} = [\widehat{\sigma}]\widehat{\gamma}^{\pm} by definition of \widehat{\sigma}'';
5711
                                • if \widehat{\gamma}^{\pm} \in uv(\bigcirc) \cap uv(N_1) then [\widehat{\sigma}'']\widehat{\gamma}^{\pm} = [\widehat{\sigma}']\widehat{\gamma}^{\pm}, and \Sigma \vdash \widehat{\sigma}' \simeq \widehat{\sigma} : uv(N_1), as noted
5712
                                     above;
                                • if \widehat{\gamma}^{\pm} \in uv(\underline{Q}) \cap uv(\underline{M}') then since T : dom(\Sigma) \vdash \underline{Q}, we have uv(\underline{Q}) \subseteq dom(\Sigma).
5714
                                     implying \widehat{\gamma}^{\pm} \in \text{dom}(\Sigma) \cap \text{uv}(\underline{M}') \subseteq \text{uv}(\underline{N}_1). This way, \widehat{\gamma}^{\pm} \in \text{uv}(\underline{Q}) \cap \text{uv}(\underline{N}_1), and
                                     this case is covered by the previous one.
5716
                           In particular, \Sigma \vdash \widehat{\sigma}'' \simeq \widehat{\sigma} : \mathbf{uv}(O). Then since \Sigma \vdash \widehat{\sigma} : C_1 and \Sigma \vdash C_1 : \mathbf{uv}(O), we have
                           \Sigma \vdash \widehat{\sigma}^{\prime\prime} : C_1.
5718
                           This way, \widehat{\sigma}' satisfies both C_1 and C_2, and by the completeness of constraint merge (lemma 83).
                            \Sigma' \vdash C_1 \& C_2 = C exists.
5720
                           Finally, to show the required properties, we take M' and \Sigma' from the induction hypothesis
5721
                           (5(c)ii), and C defined above. Then
5722
                             (1) T : \Gamma : \Sigma \models Q \rightarrow N_1 \bullet v, \overrightarrow{v} \implies M' \neq \Sigma' : C is inferred by (\rightarrow_{\bullet \rightarrow}^{INF}). As noted above:
5723
                                         (a) T; \Gamma \models \nu : \mathbf{nf}(P),
5724
                                         (b) T; \Sigma \models Q \geqslant \mathbf{nf}(P) \not\exists C_1,
5725
                                         (c) T : \Gamma : \Sigma \models N_1 \bullet \overrightarrow{v} \implies M' \neq \Sigma' : C_2, and
5726
                                         (d) \Sigma' + C_1 \& C_2 = C.
5727
                             (2) let us take an arbitrary \Sigma \vdash \widehat{\sigma}_0 : \mathbf{uv} \bigcirc \cup \mathbf{uv} N_1; and T \vdash M_0; such that T : \Gamma \vdash [\widehat{\sigma}_0] (\bigcirc \longrightarrow \mathbb{R})
5728
                                     N_1) • v, \overrightarrow{v} \implies M_0. Then by inversion of T; \Gamma \vdash [\widehat{\sigma}_0] \bigcirc \longrightarrow [\widehat{\sigma}_0] N_1 \bullet v, \overrightarrow{v} \implies M_0, we
5729
                                     have the same properties as in 5. In particular,
5730
```

5731

5732 5733 C_1 .

• $T \vdash [\widehat{\sigma}_0] Q \geqslant \mathbf{nf}(P)$ and by the completeness of subtyping (lemma 79), $\Sigma \vdash \widehat{\sigma}_0$

- $T : \Gamma \vdash [\widehat{\sigma}_0] N_1 \bullet \overrightarrow{v} \implies M_0$. Then by 5(c)ii, there exists $\widehat{\sigma}'_0$ such that
 - (a) $\Sigma' \vdash \widehat{\sigma}'_0 : \mathbf{uv}(N_1) \cup \mathbf{uv}(M')$ and $\Sigma' \vdash \widehat{\sigma}'_0 : C_2$,
 - (b) $\Sigma \vdash \widehat{\sigma}_0' \simeq^{\leqslant} \widehat{\sigma}_0 : \mathbf{uv}(N_1)$, and
 - (c) $T \vdash [\widehat{\sigma}'_0] M' \simeq^{\leq} M_0$.

Let us extend $\widehat{\sigma}_0'$ to be defined on $\mathbf{uv}(Q) \cup \mathbf{uv}(N_1) \cup \mathbf{uv}(M')$ with the values of $\widehat{\sigma}_0$. We define $\widehat{\sigma}_0''$ as follows:

$$\begin{cases} [\widehat{\sigma}_0'']\widehat{\gamma}^{\pm} = [\widehat{\sigma}_0']\widehat{\gamma}^{\pm} & \text{for } \widehat{\gamma}^{\pm} \in \mathbf{uv}\left(N_1\right) \cup \mathbf{uv}\left(M'\right) \\ [\widehat{\sigma}_0'']\widehat{\gamma}^{\pm} = [\widehat{\sigma}_0]\widehat{\gamma}^{\pm} & \text{for } \widehat{\gamma}^{\pm} \in \mathbf{uv}\left(Q\right) \setminus (\mathbf{uv}\left(N_1\right) \cup \mathbf{uv}\left(M'\right)) \end{cases}$$

This way,

- $\Sigma' \vdash \widehat{\sigma}_0'' : \mathbf{uv}(\mathbf{Q}) \cup \mathbf{uv}(\mathbf{N}_1) \cup \mathbf{uv}(\mathbf{M}')$,
- $\Sigma' \vdash \widehat{\sigma}_0'' : C$, since $\Sigma' \vdash \widehat{\sigma}_0'' : C_1$ and $\Sigma' \vdash \widehat{\sigma}_0'' : C_2$, which is proved similarly to $\Sigma' \vdash \widehat{\sigma}'' : C_1$ and $\Sigma' \vdash \widehat{\sigma}'' : C_2$ above;
- $\Sigma \vdash \widehat{\sigma}_0'' \simeq^{\leqslant} \widehat{\sigma}_0 : \mathbf{uv}(N_1) \cup \mathbf{uv}(Q)$: the proof is analogous to $\Sigma \vdash \widehat{\sigma}'' \simeq^{\leqslant} \widehat{\sigma} \mathbf{uv}(N_1) \cup \mathbf{uv}(Q)$ above.
- $T \vdash [\widehat{\sigma}_0'']M' \simeq^{\leqslant} M_0$ Notice that $\Sigma' \vdash \widehat{\sigma}_0'' \simeq^{\leqslant} \widehat{\sigma}_0' : \mathbf{uv}(N_1) \cup \mathbf{uv}(M')$, which is proved analogously to $\Sigma' \vdash \widehat{\sigma}'' \simeq^{\leqslant} \widehat{\sigma}' : \mathbf{uv}(N_1) \cup \mathbf{uv}(M')$ above. Then $T \vdash [\widehat{\sigma}_0']M' \simeq^{\leqslant} M_0$ can be rewritten to $T \vdash [\widehat{\sigma}_0'']M' \simeq^{\leqslant} M_0$.

Case 15. $(\emptyset_{\bullet \Longrightarrow}^{INF})$

By assumption:

- (1) $T \vdash^{\supseteq} \Sigma$,
- (2) $T \vdash N'$
- (3) $T : \mathbf{dom}(\Sigma) \vdash \mathbf{N}$ and \mathbf{N} is free from negative variables,
- (4) $\Sigma \vdash \widehat{\sigma} : \mathbf{uv}(N)$,
- (5) $T : \Gamma \vdash [\widehat{\sigma}] N \bullet \cdot \Longrightarrow N'$, and by inversion, $T \vdash [\widehat{\sigma}] N \simeq^{\leqslant} N'$.

Then we can apply the corresponding algorithmic rule $(\emptyset_{\bullet \Longrightarrow}^{\text{INF}})$ to infer $T ; \Gamma ; \Sigma \models \mathbb{N} \bullet \cdot \Longrightarrow$ **nf** $(\mathbb{N}) \dashv \Sigma ; \cdot$. Let us show the required properties. Let us take an arbitrary $\Sigma \vdash \widehat{\sigma}_0 : \mathbf{uv} (\mathbb{N})$ and $T \vdash M$ such that $T ; \Gamma \vdash [\widehat{\sigma}_1] \mathbb{N} \bullet \cdot \Longrightarrow M$. Then we can take $\widehat{\sigma}_0$ as the required substitution:

- (1) $\Sigma \vdash \widehat{\sigma}_0 : \mathbf{uv}(N) \cup \mathbf{uv}(\mathbf{nf}(N))$, since $\mathbf{uv}(\mathbf{nf}(N)) = \mathbf{uv}(N)$, and thus, $\mathbf{uv}(N) \cup \mathbf{uv}(\mathbf{nf}(N)) = \mathbf{uv}(N)$;
- (2) $\Sigma \vdash \widehat{\sigma}_0 : \cdot \text{ vacuously};$
- (3) $\Sigma \vdash \widehat{\sigma}_0 \simeq^{\leqslant} \widehat{\sigma}_0 : \mathbf{uv}(N)$ by reflexivity;
- (4) Let us show $T \vdash [\widehat{\sigma}_0] \mathbf{nf}(N) \simeq^{\leqslant} M$. Notice that $T ; \Gamma \vdash [\widehat{\sigma}_0] N \bullet \cdot \Longrightarrow M$ can only be inferred by $(\emptyset_{\bullet \Longrightarrow}^{\mathrm{INF}})$, and thus, $T \vdash [\widehat{\sigma}_0] N \simeq^{\leqslant} M$. By corollary 17, $T \vdash [\widehat{\sigma}_0] N \simeq^{\leqslant} [\widehat{\sigma}_0] \mathbf{nf}(N)$, and then by transitivity, $T \vdash [\widehat{\sigma}_0] \mathbf{nf}(N) \simeq^{\leqslant} M$, that is $T \vdash [\widehat{\sigma}_0] \mathbf{nf}(N) \simeq^{\leqslant} M$.
