1 Definitions and Algorithms

1.1 Declarative Types

1.1.1 Grammar. We assume that there is an infinite set of positive and negative *type* variables. Positive type variables are denoted as α^+ , β^+ , γ^+ , etc. Negative type variables are denoted as α^- , β^- , γ^- , etc. We assume there is an infinite set of *term* variables, which are denoted as x, y, z, etc. A list of objects (variables, types or terms) is denoted by an overline arrow. For instance, α^+ is a list of positive type variables, β^- is a list of negative type variables, γ^- is a list of values, which are arguments of a function. fv γ^- and fv γ^- denote the set of free variables in a type γ^- and γ^- and γ^- respectively.

Definition 1 (Declarative Types).

Negative declarative types

Positive declarative types

$$P, Q, R \qquad ::= \qquad \qquad | \quad \alpha^{+} \\ | \quad \downarrow N \\ | \quad \exists \alpha^{-} \cdot P$$

1.1.2 Equalities. For simplicity, we assume alpha-equivalent terms are equal. This way, we assume that substitutions do not capture bound variables. Besides, we equate $\forall \overrightarrow{\alpha^+}. \forall \overrightarrow{\beta^+}. N$ with $\forall \overrightarrow{\alpha^+}, \overrightarrow{\beta^+}. N$, as well as $\exists \overrightarrow{\alpha^-}. \exists \overrightarrow{\beta^-}. P$ with $\exists \overrightarrow{\alpha^-}, \overrightarrow{\beta^-}. P$, and lift these equations transitively and congruently to the whole system.

1.1.3 Contexts and Well-formedness.

Definition 2 (Declarative Type Context).

Declarative type context Θ is represented by a set of type variables. The concatenation Θ_1, Θ_2 means the union of two contexts $\Theta_1 \cup \Theta_2$.

 $\Theta \vdash P$ and $\Theta \vdash N$ denote that the type is well-formed in the context Θ , which means that each free type variable of the type is contained in Θ (it will be shown later in Lemmas 3 and 4).

Notice that checking the well-formedness of a type is an *algorithmic* procedure, in which both the context and the type are considered inputs. In other words, it is syntax-directed and mode-correct (according to Dunfield et al. [2020]), which means that checking the well-formedness of a type can be done recursively by a deterministic algorithm. We will use the well-formedness checking in the inference algorithm, for example, to check that the existential variables do not escape their scope.

Algorithm 1 (Type Well-formedness).

 $\Theta \vdash N$ Negative type well-formedness $\Theta \vdash P$ Positive type well-formedness

$$\frac{\alpha^{-} \in \Theta}{\Theta \vdash \alpha^{-}} (VAR_{-}^{WF}) \qquad \frac{\alpha^{+} \in \Theta}{\Theta \vdash \alpha^{+}} (VAR_{+}^{WF})$$

$$\frac{\Theta \vdash P}{\Theta \vdash \uparrow P} (\uparrow^{WF}) \qquad \frac{\Theta \vdash N}{\Theta \vdash \downarrow N} (\downarrow^{WF})$$

$$\frac{\Theta \vdash P \quad \Theta \vdash N}{\Theta \vdash P \rightarrow N} (\rightarrow^{WF}) \qquad \frac{\Theta, \alpha^{-} \vdash P}{\Theta \vdash \exists \alpha^{-} \cdot P} (\exists^{WF})$$

$$\frac{\Theta, \alpha^{+} \vdash N}{\Theta \vdash \forall \alpha^{+} \cdot N} (\forall^{WF})$$

1.1.4 Substitutions.

Definition 3 (*Substitution*). Substitutions (denoted as σ) are represented by total functions from variables to types, preserving the polarity.

Algorithm 2 (*Substitution Application*). Substitution application is denoted as $[\sigma]P$ and $[\sigma]N$. It is defined naturally as follows:

$$[\sigma]\alpha^{+} = \sigma(\alpha^{+})$$

$$[\sigma](P \to N) = [\sigma]P \to [\sigma]N$$

$$[\sigma]\alpha^{-} = \sigma(\alpha^{-})$$

$$[\sigma]\exists \overrightarrow{\alpha^{-}} \cdot Q = \exists \overrightarrow{\alpha^{-}} \cdot [\sigma]Q$$

$$[\sigma]\downarrow N = \downarrow [\sigma]N$$

$$[\sigma]\uparrow P = \uparrow [\sigma]P$$

Definition 4 (*Substitution Signature*). The signature $\Theta' \vdash \sigma : \Theta$ means that

- (1) for any $\alpha^{\pm} \in \Theta, \Theta' \vdash [\sigma] \alpha^{\pm}$; and
- (2) for any $\alpha^{\pm} \notin \Theta'$, $[\sigma] \alpha^{\pm} = \alpha^{\pm}$.

A substitution can be restricted to a set of variables. The restricted substitution is define as expected.

Definition 5 (Substitution Restriction). The specification $\sigma|_{vars}$ is defined as a function such that

- (1) $\sigma|_{vars}(\alpha^{\pm}) = \sigma(\alpha^{\pm})$, if $\alpha^{\pm} \in vars$; and
- (2) $\sigma|_{vars}(\alpha^{\pm}) = \alpha^{\pm}$, if $\alpha^{\pm} \notin vars$.

Two substitutions can be composed in two ways: $\sigma_2 \circ \sigma_1$ corresponds to a consecutive application of σ_1 and σ_2 , while $\sigma_2 \ll \sigma_1$ depends on a signature of σ_1 and modifies σ_1 by applying σ_2 to its results on the domain.

Definition 6 (Substitution Composition). $\sigma_2 \circ \sigma_1$ is defined as a function such that $\sigma_2 \circ \sigma_1(\alpha^{\pm}) = \sigma_2(\sigma_1(\alpha^{\pm}))$.

, Vol. 1, No. 1, Article . Publication date: July 2024.

Definition 7 (Monadic Substitution Composition). Suppose that $\Theta' \vdash \sigma_1 : \Theta$. Then we define $\sigma_2 \ll \sigma_1$ as $(\sigma_2 \circ \sigma_1)|_{\Theta}$.

Notice that the result of $\sigma_2 \ll \sigma_1$ depends on the specification of σ_1 , which is not unique. However, we assume that the used specification clear from the context of the proof.

Definition 8 (Equivalent Substitutions). The substitution equivalence judgement $\Theta' \vdash \sigma_1 \simeq^{\varsigma} \sigma_2 : \Theta$ indicates that on the domain Θ , the result of σ_1 and σ_2 are equivalent in context Θ' . Formally, for any $\alpha^{\pm} \in \Theta$, $\Theta' \vdash [\sigma_1] \alpha^{\pm} \simeq^{\varsigma} [\sigma_2] \alpha^{\pm}$.

Sometimes it is convenient to construct a substitution that explicitly maps each variable from a list (or a set) to a type. Such substitutions are denoted as $\overrightarrow{P}/\overrightarrow{\alpha^+}$ and $\overrightarrow{N}/\overrightarrow{\alpha^-}$, where \overrightarrow{P} and \overrightarrow{N} are lists of the corresponding types.

Definition 9 (Explicit Substitution).

- Suppose that $\overrightarrow{\alpha}$ is a list of negative type variables, and \overrightarrow{N} is a list of negative types of the same length. Then $\overrightarrow{N}/\overrightarrow{\alpha}$ denotes a substitution such that
 - (1) for $\alpha_i^+ \in \overrightarrow{\alpha}^-$, $[\overrightarrow{N}/\overrightarrow{\alpha}^-]\alpha_i^+ = N_i$;
 - (2) for $\beta^+ \notin \overrightarrow{\alpha}^-$, $[\overrightarrow{N}/\overrightarrow{\alpha}^-]\beta^+ = \beta^+$.
- + Positive explicit substitution $\overrightarrow{P}/\overrightarrow{\alpha^+}$ is defined symmetrically.
- 1.1.5 Declarative Subtyping. Subtyping is one of the key mechanisms of our system. It realizes the polymorphism: abstract \forall and \exists types can be used where concrete types are expected, exactly because of the subtyping relation between them.

Definition 10 (Declarative Subtyping and Equivalence).

 $\frac{\Theta \vdash N \leqslant M \quad \Theta \vdash M \leqslant N}{\Theta \vdash N \cong^{\leqslant} M} \ (\cong^{\leqslant}_{-})$

 $\frac{\Theta \vdash P \geqslant Q \quad \Theta \vdash Q \geqslant P}{\Theta \vdash P \simeq^{\leqslant} O} \ (\simeq^{\leqslant}_{+})$

 The following observations about the declarative subtyping are worth noting:

- (VAR[≤]) and (VAR[≥]) make the subtyping reflexive on variables (and further, on any type).
- (→[≤]) is standard: the arrow is covariant on the resulting type and contravariant on the argument type.
- (\downarrow^{\geqslant}) and (\uparrow^{\leqslant}) are non-standard: the subtyping is *invariant* for shifts. This way, the subtyping of shifted types in one direction implies the subtyping in the opposite direction. Although this rule restricts the subtyping relation, it makes the system decidable.
- (∀[≤]) and (∃[≥]) are the only non-algorithmic rules: the substitution for the quantified variable is not specified, those, these rules 'drive' the subtyping relation.

In the next section, we present the sound and complete algorithm checking whether one type is a subtype of another according to Definition 10.

1.2 Algorithmic Types

1.2.1 *Grammar.* In the algorithmic system, we extend the grammar of types by adding positive and negative *algorithmic variables* $(\widehat{\alpha}^+, \widehat{\beta}^+, \widehat{\gamma}^+,$ etc. and $\widehat{\alpha}^-, \widehat{\beta}^-, \widehat{\gamma}^-,$ etc.). They represent the unknown types, which will be inferred by the algorithm. This way, we add two base cases to the grammar of positive and negative types and use highlight to denote that the type can potentially contain algorithmic variables.

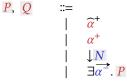

Definition 11 (Algorithmic Types). Negative algorithmic type

$$N, M ::=$$

$$\begin{vmatrix} \widehat{\alpha} \\ \alpha^{-} \\ \alpha^{-} \end{vmatrix}$$

$$\begin{vmatrix} P \\ P \\ \alpha^{+} N \end{vmatrix}$$

Positive algorithmic type

- 1.2.2 Fresh Variable Selection. Both the subtyping and the type inference algorithm rely on the ability to select fresh, unused variables. For a set of variables vars, it is indicated as vars are fresh in the inference rules. We assume that the selection subroutine always succeeds and is deterministic. In other words, whenever it is called in an algorithmic inference rule, it returns the same result, uniquely determined by the input of this rule.
- 1.2.3 Variable Algorithmization. In several places of our algorithm, in particular, during algorithmic subtyping, we turn a declarative type into an algorithmic one via replacing certain type variables with fresh algorithmic variables. We call this procedure *variable algorithmization*, and define it as follows.

Definition 12 (*Variable Algorithmization*). Suppose that $\overrightarrow{\alpha}$ is a list of negative type variables and $\overrightarrow{\widehat{\alpha}}$ is a list of negative algorithmic variables of the same length. Then $\overrightarrow{\widehat{\alpha}}/\overrightarrow{\alpha}$ is a substitution-like procedure replacing each $\alpha_i^- \in \overrightarrow{\alpha}$ in a type for $\widehat{\alpha_i}^- \in \overrightarrow{\widehat{\alpha}}$.

Conversely, we have the opposite procedure turning algorithmic type variables into declarative type variables via *dealgorithmization*.

Definition 13 (Variable Dealgorithmization). Suppose that $\overrightarrow{\alpha}$ is a list of negative algorithmic variables and $\overrightarrow{\alpha}$ is a list of negative type variables of the same length. Then $\overrightarrow{\alpha}/\overrightarrow{\alpha}$ is a substitution-like procedure replacing each $\widehat{\alpha_i}^- \in \overrightarrow{\widehat{\alpha}}$ in a type for $\alpha_i^- \in \overrightarrow{\alpha}$.

1.2.4 Contexts and Well-formedness.

 Definition 14 (Algorithmic Type Context $\widehat{\Theta}$).

Algorithmic type context $\widehat{\Theta}$ is represented by a set of *algorithmic* type variables $(\widehat{\alpha}^+, \widehat{\alpha}^-, \widehat{\beta}^+, \ldots)$. The concatenation $\widehat{\Theta}_1, \widehat{\Theta}_2$ means the union of two contexts $\widehat{\Theta}_1 \cup \widehat{\Theta}_2$.

 Θ ; $\widehat{\Theta} \vdash P$ and Θ ; $\widehat{\Theta} \vdash N$ are used to denote that the algorithmic type is well-formed in the contexts Θ and $\widehat{\Theta}$, which means that each algorithmic variable of the type is contained in $\widehat{\Theta}$, and each free declarative type variable of the type is contained in Θ .

Algorithm 3 (Algorithmic Type Well-formedness).

$$\begin{array}{lll} \Theta : \widehat{\Theta} \vdash N & \text{Negative type well-formedness} & \Theta : \widehat{\Theta} \vdash P & \text{Positive type well-formedness} \\ & \frac{\alpha^- \in \Theta}{\Theta : \widehat{\Theta} \vdash \alpha^-} (\text{VAR}^{\text{WF}}_-) & \frac{\alpha^+ \in \Theta}{\Theta : \widehat{\Theta} \vdash \alpha^-} (\text{VAR}^{\text{WF}}_+) \\ & \frac{\widehat{\alpha}^- \in \widehat{\Theta}}{\Theta : \widehat{\Theta} \vdash \widehat{\alpha}^-} (\text{UVAR}^{\text{WF}}_-) & \frac{\widehat{\alpha}^+ \in \widehat{\Theta}}{\Theta : \widehat{\Theta} \vdash \widehat{\alpha}^+} (\text{UVAR}^{\text{WF}}_+) \\ & \frac{\Theta : \widehat{\Theta} \vdash P}{\Theta : \widehat{\Theta} \vdash P} (\uparrow^{\text{WF}}) & \frac{\Theta : \widehat{\Theta} \vdash N}{\Theta : \widehat{\Theta} \vdash P} (\downarrow^{\text{WF}}) \\ & \frac{\Theta : \widehat{\Theta} \vdash P}{\Theta : \widehat{\Theta} \vdash P} (\uparrow^{\text{WF}}) & \frac{\Theta : \widehat{\alpha}^+ : \widehat{\Theta} \vdash P}{\Theta : \widehat{\Theta} \vdash P} (\exists^{\text{WF}}) \\ & \frac{\Theta : \widehat{\alpha}^+ : \widehat{\Theta} \vdash N}{\Theta : \widehat{\Theta} \vdash P} (\exists^{\text{WF}}) & \frac{\Theta : \widehat{\alpha}^+ : \widehat{\Theta} \vdash P}{\Theta : \widehat{\Theta} \vdash P} (\exists^{\text{WF}}) \end{array}$$

Algorithmic Type Contexts are used in the unification algorithm. In the subtyping algorithm, the context needs to remember additional information. In particular, each algorithmic variable is associated with a context it must be instantiated in (i.e. the context in which the type replacing the variable must be well-formed). This association is represented by *instantiation context* Ξ .

Definition 15 (*Instantiation Context* Ξ).

Instantiation context Ξ is represented by a set of entries of form $\widehat{\alpha}^+\{\Theta\}$ and $\widehat{\alpha}^-\{\Theta\}$, where $\widehat{\alpha}^+$ and

 $\widehat{\alpha}^-$ are algorithmic variables, and Θ is a context in which they must be instantiated. We assume that Ξ does not contain multiple entries for the same variable.

 $dom(\Xi)$ denotes the set of variables appearing in Ξ : $dom(\Xi) = \{\widehat{\alpha}^{\pm} \mid \widehat{\alpha}^{\pm} \{\Theta\} \in \Xi\}$. If $\widehat{\alpha}^{\pm} \{\Theta\} \in \Xi$, we denote Θ as $\Xi(\widehat{\alpha}^{\pm})$.

1.2.5 Substitutions. A substitution that operates on algorithmic type variables is denoted as $\widehat{\sigma}$. It is defined as a total function from algorithmic type variables to *declarative* types, preserving the polarity.

The signature $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$ means that $\widehat{\Theta} \subseteq \text{dom}(\Xi)$ and $\widehat{\sigma}$ maps each algorithmic variable from $\widehat{\Theta}$ to a type well-formed in $\Xi(\widehat{\alpha}^{\pm})$; and for each variable not appearing in dom (Ξ) , it acts as identity.

Definition 16 (Signature of Algorithmic Substitution).

• $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$ means that

- (1) for any $\widehat{\alpha}^{\pm} \in \widehat{\Theta}$, there exists Θ such that $\widehat{\alpha}^{\pm} \{ \Theta \} \in \Xi$ and $\Theta \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm}$;
- (2) for any $\widehat{\alpha}^{\pm} \notin \widehat{\Theta}$, $[\widehat{\sigma}]\widehat{\alpha}^{\pm} = \widehat{\alpha}^{\pm}$.
- $\Theta \vdash \widehat{\sigma} : \widehat{\Theta}$ means that
 - (1) for any $\widehat{\alpha}^{\pm} \in \widehat{\Theta}$, $\Theta \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm}$;
 - (2) for any $\widehat{\alpha}^{\pm} \notin \widehat{\Theta}$, $[\widehat{\sigma}]\widehat{\alpha}^{\pm} = \widehat{\alpha}^{\pm}$.

In the anti-unification algorithm, we use another kind of substitution. In contrast to algorithmic substitution $\widehat{\sigma}$, it allows mapping algorithmic variables to *algorithmic* types. Additionally, anti-unification substitution is restricted to the *negative* segment of the language. Anti-unification substitution is denoted as $\widehat{\tau}$ and $\widehat{\rho}$.

The pair of contexts Θ and $\widehat{\Theta}$, in which the results of an anti-unification substitution are formed, is fixed for this substitution. This way, Θ ; $\widehat{\Theta}_2 \vdash \widehat{\tau} : \widehat{\Theta}_1$ means that $\widehat{\tau}$ maps each negative algorithmic variable appearing in $\widehat{\Theta}_1$ to a term well-formed in Θ and $\widehat{\Theta}_2$.

Definition 17 (Signature of Anti-unification substitution). Θ ; $\widehat{\Theta}_2 \vdash \widehat{\tau} : \widehat{\Theta}_1$ means that

- (1) for any $\widehat{\alpha}^- \in \widehat{\Theta}_1$, Θ ; $\widehat{\Theta}_2 \vdash [\widehat{\tau}] \widehat{\alpha}^-$ and
- (2) for any $\widehat{\alpha}^- \notin \widehat{\Theta}_1$, $[\widehat{\tau}]\widehat{\alpha}^- = \widehat{\alpha}^-$.
- 1.2.6 Equivalence and Normalization. The subtyping-induced equivalence (Definition 10) is non-trivial: there are types that are subtypes of each other but not equal. For example, $\forall \alpha^+, \beta^+, \alpha^+ \to \uparrow \beta^+$ is a subtype and a supertype of $\forall \alpha^+, \beta^+, \beta^+ \to \uparrow \alpha^+$ and of, for example, $\forall \alpha^+, \beta^+, \beta^+ \to \uparrow \exists \gamma^-, \alpha^+$, although these types are not alpha-equivalent. For the subtyping algorithm, it is crucial to be able to check whether two types are equivalent, without checking mutual subtyping. For this purpose we define the normalization procedure, which allows us to uniformly choose the representative

type of the equivalence class. This way, the equivalence checking is reduced to normalization and equality checking.

For clarification of the proofs and better understanding of the system, we introduce an intermediate relation—declarative equivalence. As will be shown in Lemmas 29 and 34, this relation is equivalent to the subtyping-induced equivalence, but does not depend on it. Although this relation is not defined algorithmically, it gives the intuition of what types our system considers equivalent. Specifically, in addition to alpha-equivalence, our system allows for reordering of adjacent quantifiers, and introduction/elimination of unused quantifiers.

The non-trivial rules of the declarative equivalence are (\forall^{\sim^D}) and (\exists^{\sim^D}) . Intuitively, the variable bijection μ reorders the quantifiers before the recursive call on the body of the quantified type. It will be covered formally in Section 3.1.4.

Definition 18 (Declarative Type Equivalence). $N \simeq^{D} M$ Negative type equivalence $\frac{P \simeq^{D} Q}{\alpha^{-} \simeq^{D} \alpha^{-}} (VAR_{-}^{\simeq^{D}})$ $\frac{P \simeq^{D} Q}{\uparrow P \simeq^{D} \uparrow Q} (\uparrow^{\simeq^{D}})$ $\frac{P \simeq^{D} Q}{\uparrow P \simeq^{D} \uparrow Q} (\uparrow^{\simeq^{D}})$ $\frac{P \simeq^{D} Q \qquad N \simeq^{D} M}{P \rightarrow N \simeq^{D} Q \rightarrow M} (\rightarrow^{\simeq^{D}})$ $\frac{P \simeq^{D} Q \qquad N \simeq^{D} M}{P \rightarrow N \simeq^{D} Q \rightarrow M} (\rightarrow^{\simeq^{D}})$ $\frac{\mu : (\overrightarrow{\beta^{+}} \cap \text{fv} M) \leftrightarrow (\overrightarrow{\alpha^{+}} \cap \text{fv} N)}{\alpha^{+} \cap \text{fv} M} (\bigvee^{\simeq^{D}})$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} P)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} P)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} P)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} P)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} P)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} P)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} P)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} P)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} P)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} P)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} Q)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\alpha^{-}} \cap \text{fv} Q)}{\alpha^{-} \cap \text{fv} Q} (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{\beta^{-}} \cap \text{fv} Q) \leftrightarrow (\overrightarrow{\beta^{-}} \cap \text{fv} Q)$ $\frac{\mu : (\overrightarrow{$

As the equivalence includes arbitrary reordering of quantified variables, the normalization procedure is needed to choose the canonical order. For this purpose, we introduce an auxiliary procedure—variable ordering. Intuitively, ord vars in N returns a list of variables from vars in the order they appear in N.

Algorithm 4 (Variable Ordering).

 ord vars in $N = \vec{\alpha}$ variable ordering in a negative type

$$\frac{\alpha^{-} \in vars}{\operatorname{ord} vars \operatorname{in} \alpha^{-} = \alpha^{-}} (\operatorname{VAR}_{-\epsilon}^{\operatorname{ORD}})$$

$$\frac{\alpha^{-} \notin vars}{\operatorname{ord} vars \operatorname{in} \alpha^{-} = \cdot} (\operatorname{VAR}_{-\epsilon}^{\operatorname{ORD}})$$

$$\frac{\operatorname{ord} vars \operatorname{in} P = \overrightarrow{\alpha}}{\operatorname{ord} vars \operatorname{in} P = \overrightarrow{\alpha}} (\uparrow^{\operatorname{ORD}})$$

$$\frac{\operatorname{ord} vars \operatorname{in} P = \overrightarrow{\alpha}_{1} \quad \operatorname{ord} vars \operatorname{in} N = \overrightarrow{\alpha}_{2}}{\operatorname{ord} vars \operatorname{in} P \to N = \overrightarrow{\alpha}_{1}, (\overrightarrow{\alpha}_{2} \setminus \overrightarrow{\alpha}_{1})} (\to^{\operatorname{ORD}})$$

$$\frac{vars \cap \overrightarrow{\alpha^{+}} = \emptyset \quad \text{ord } vars \text{ in } N = \overrightarrow{\alpha}}{\text{ord } vars \text{ in } \forall \overrightarrow{\alpha^{+}}. N = \overrightarrow{\alpha}} \ (\forall^{\text{Ord}})$$

ord $varsin P = \vec{\alpha}$ variable ordering in a positive type

$$\frac{\alpha^{+} \in vars}{\operatorname{ord} vars \operatorname{in} \alpha^{+} = \alpha^{+}} \left(\operatorname{VAR}_{+ \in}^{\operatorname{ORD}} \right)$$

$$\frac{\alpha^{+} \notin vars}{\operatorname{ord} vars \operatorname{in} \alpha^{+} = \cdot} \left(\operatorname{VAR}_{+ \notin}^{\operatorname{ORD}} \right)$$

$$\frac{\operatorname{ord} vars \operatorname{in} N = \overrightarrow{\alpha}}{\operatorname{ord} vars \operatorname{in} N = \overrightarrow{\alpha}} \left(\downarrow^{\operatorname{ORD}} \right)$$

$$\frac{vars \cap \overrightarrow{\alpha^{-}} = \emptyset \quad \operatorname{ord} vars \operatorname{in} P = \overrightarrow{\alpha}}{\operatorname{ord} vars \operatorname{in} \exists \overrightarrow{\alpha^{-}} \cdot P = \overrightarrow{\alpha}} \left(\exists^{\operatorname{ORD}} \right)$$

Analogously, the variable can be ordered in an *algorithmic* type (ord *vars* in \mathbb{P} and ord *vars* in \mathbb{N}). In these cases, we treat the algorithmic variables as if they were declarative variables.

Next, we use the variable ordering in the normalization procedure. Specifically, normalization recursively traverses the type, and for each quantified case reorders the quantified variables in a canonical order dictated by Algorithm 4, removing unused ones.

Algorithm 5 (Type Normalization).

$$\frac{\inf(N) = M}{\inf(\alpha^{-}) = \alpha^{-}} (VAR_{-}^{NF}) \qquad \frac{\inf(P) = Q}{\inf(\alpha^{+}) = \alpha^{+}} (VAR_{+}^{NF}) \qquad \frac{\inf(P) = Q}{\inf(P) = Q} (\uparrow^{NF}) \qquad \frac{\inf(N) = M}{\inf(\downarrow N) = \downarrow M} (\downarrow^{NF}) \qquad \frac{\inf(P) = Q \quad \inf(N) = M}{\inf(P) = N) = Q \rightarrow M} (\rightarrow^{NF}) \qquad \frac{\inf(P) = P' \quad \text{ord } \overrightarrow{\alpha^{+}} \text{ in } P' = \overrightarrow{\alpha^{+}}'}{\inf(A^{-}) = A^{-}} (A^{NF}) \qquad \frac{\inf(N) = N' \quad \text{ord } \overrightarrow{\alpha^{+}} \text{ in } N' = \overrightarrow{\alpha^{+}}'}{\inf(A^{-}) = A^{-}} (A^{NF}) \qquad \frac{\inf(N) = N' \quad \text{ord } \overrightarrow{\alpha^{+}} \text{ in } N' = \overrightarrow{\alpha^{+}}'}{\inf(A^{-}) = A^{-}} (A^{NF}) \qquad \frac{\inf(N) = N' \quad \text{ord } \overrightarrow{\alpha^{+}} \text{ in } N' = \overrightarrow{\alpha^{+}}'}{\inf(A^{-}) = A^{-}} (A^{NF}) \qquad \frac{\inf(N) = N' \quad \text{ord } \overrightarrow{\alpha^{+}} \text{ in } N' = \overrightarrow{\alpha^{+}}'}{\inf(A^{-}) = A^{-}} (A^{NF}) \qquad \frac{\inf(N) = M}{\inf(A^{-}) = A^{-}} (A^{NF}) \qquad \frac{\inf(N) = A^{-}}{\inf(A^{-}) = A^{-}} (A^{NF})$$

Analogously, we define the normalization of algorithmic types by adding the following base cases:

$$\frac{\inf(N) = M}{\inf(\widehat{\alpha}^{-}) = \widehat{\alpha}^{-}} (UVAR_{-}^{NF})$$

$$\frac{\inf(\widehat{\alpha}^{+}) = \widehat{\alpha}^{+}}{\inf(\widehat{\alpha}^{+}) = \widehat{\alpha}^{+}} (UVAR_{+}^{NF})$$

Lemma 48 demonstrates that the equivalence of types is the same as the equality of their normal forms.

Theorem (Correctness of Normalization). Assuming the types are well-formed in Θ ,

 $-\Theta \vdash N \simeq^{\leq} M$ if and only if nf(N) = nf(M);

 $+\Theta \vdash P \simeq \bigcirc O$ if and only if nf(P) = nf(O).

Algorithm 6 (Substitution Normalization). For a substitution σ , we define $\inf(\sigma)$ as a substitution that maps α^{\pm} into nf ($[\sigma]\alpha^{\pm}$).

The rest of this chapter is devoted to the central algorithm of the type system—the subtyping algorithm.

Subtyping. Now, we present the subtyping algorithm itself. Although the algorithm is presented as a single procedure, is important for the structure of the proof that the positive subtyping algorithm does not invoke the negative one. This way, the correctness of the positive subtyping will be proved independently and used afterwards to prove the correctness of the negative subtyping.

Algorithm 7 (Subtyping).

 Θ ; $\Xi \models N \leq M \dashv C$ Negative subtyping

$$\frac{\Theta; \Xi \models \alpha^{-} \leqslant \alpha^{-} \dashv \cdot (VAR^{\leqslant})}{\Theta; \Xi \models nf(P) \stackrel{u}{\cong} nf(Q) \dashv UC}$$

$$\frac{\Theta; \Xi \models nf(P) \stackrel{u}{\cong} nf(Q) \dashv UC}{\Theta; \Xi \models \uparrow P \leqslant \uparrow Q \dashv UC} (\uparrow^{\leqslant})$$

$$\frac{\overrightarrow{\alpha^{+}}}{\overrightarrow{\alpha^{+}}} \text{ are fresh}$$

$$\frac{\Theta, \overrightarrow{\beta^{+}}; \Xi, \overrightarrow{\alpha^{+}} \{\Theta, \overrightarrow{\beta^{+}}\} \models [\overrightarrow{\alpha^{+}}/\overrightarrow{\alpha^{+}}] N \leqslant M \dashv C}{\Theta; \Xi \models V\overrightarrow{\alpha^{+}}. N \leqslant V\overrightarrow{\beta^{+}}. M \dashv C \setminus \overrightarrow{\alpha^{+}}}$$

$$\frac{\Theta; \Xi \models P \geqslant Q \dashv C_{1}}{\Theta; \Xi \models N \leqslant M \dashv C_{2}}$$

$$\frac{\Xi \vdash C_{1} \& C_{2} = C}{\Theta; \Xi \models P \rightarrow N \leqslant Q \rightarrow M \dashv C} (\rightarrow^{\leqslant})$$

 Θ ; $\Xi \models P \geqslant Q \Rightarrow C$ Positive supertyping

$$\overline{\Theta; \Xi \models \alpha^{+} \geqslant \alpha^{+} \exists \cdot} (VAR_{+}^{\geqslant})$$

are fresh
$$\Theta, \overrightarrow{\beta^{-}}; \Xi, \overrightarrow{\alpha^{-}} \{\Theta, \overrightarrow{\beta^{-}}\} \models [\overrightarrow{\alpha^{-}}/\overrightarrow{\alpha^{-}}] \overrightarrow{P} \geqslant Q \dashv C$$

$$\Theta; \Xi \models \exists \overrightarrow{\alpha^{-}}. \overrightarrow{P} \geqslant \exists \overrightarrow{\beta^{-}}. Q \dashv C \setminus \overrightarrow{\alpha^{-}}$$

$$\Theta; \Xi \models \inf(N) \stackrel{u}{\simeq} \inf(M) \dashv UC$$

$$\Theta; \Xi \models \downarrow N \geqslant \downarrow M \dashv UC$$

$$Upgrade \Theta \vdash P \text{ to } \Xi(\overrightarrow{\alpha^{+}}) = Q$$

$$UV \vdash A \geqslant 0$$

$$\frac{\operatorname{upgrade} \Theta \vdash P \operatorname{to} \Xi(\widehat{\alpha}^{+}) = Q}{\Theta \colon \Xi \models \widehat{\alpha}^{+} \geqslant P \ni (\widehat{\alpha}^{+} \colon \geqslant Q)} (\operatorname{UVAR}^{\geqslant})$$

The inputs of the subtyping algorithm are the declarative context Θ , the instantiation context Ξ (it specifies in which contexts the algorithmic variables must be instantiated), and the types themselves: \mathbb{N} and M for the negative case, and \mathbb{P} and \mathbb{Q} for the positive case. As one of the invariants, we require M and \mathbb{Q} to be declarative (i.e. not containing algorithmic variables). The output of the algorithm is a set of *subtyping constraints* C, which will be discussed in the next section.

Let us overview the inference rules of the subtyping algorithm.

- (VAR[≤]) and (VAR[≥]) are the base cases. They copy the corresponding declarative rules and ensure reflexivity.
- (UVAR*) is the only case generating subtyping constraints. In this case, we must ensure that the resulting constraints guarantee that the instantiation of $\widehat{\alpha}^+$ is a supertype of P. However, the obvious constraint $\widehat{\alpha}^+ : \ge P$ might be problematic if P is not well-formed in $\Xi(\widehat{\alpha}^+)$. For this reason, we use the *upgrade* procedure (it will be covered in Section 1.2.10) to find the minimal supertype of P, which is well-formed in $\Xi(\widehat{\alpha}^+)$.
 - Notice that this rule does not have a negative counterpart. This is because one of the important invariants of the algorithm: in the negative subtyping, only positive algorithmic variables can occur in the types.
- (\downarrow) and (\uparrow <) are the *shift* rules. According to the declarative system, shifted subtyping requires equivalence. In the presence of the algorithmic variables, it means that the left and the right-hand sides of the subtyping must be unified. Hence, the shift rules invoke the unification algorithm, which will be discussed in Section 1.2.9. The unification returns the minimal set of constraints UC, which is necessary and sufficient for the subtyping.
- (→[≤]). In this case, the algorithm makes two calls: a recursive call to the negative subtyping algorithm for the argument types, and a call to the positive subtyping algorithm for the result types. After that, the resulting constraints are merged using the *subtyping constraint merge* procedure, which is discussed in Section 1.2.8.
- (∀[≤]) and (∃[≥]) are symmetric. These are the only places where the algorithmic variables are introduced. It is done by algorithmization (Section 1.2.3) of the quantified variables: these variables are replaced by fresh algorithmic variables in the body of the quantified type, the algorithmic variables are added to the instantiation context Ξ, after that, the recursive call is made. Notice that the declarative context Θ is extended by the quantified variables from the right-hand side, which matches the declarative system.

Then soundness lemma (Lemmas 86 and 92) and completeness (Lemmas 87 and 93) of the algorithm together give us the following simplified theorem:

Theorem (Correctness of subtyping algorithm).

```
- \Theta; · \models N \leq M \dashv · is equivalent to \Theta \vdash N \leq M;
+ \Theta; · \models P \geqslant Q \dashv · is equivalent to \Theta \vdash P \geqslant Q.
```

1.2.8 Constraints. Unification and subtyping algorithms are based on constraint generation. The constraints are represented by a set of constraint entries.

Definition 19 (Unification Constraint).

unification entry (denoted as ue) is an expression of shape $\widehat{\alpha}^+ :\simeq P$ or $\widehat{\alpha}^- :\simeq N$;

unification constraint (denoted as UC) is a set of unification constraint entries. We denote $\{\widehat{\alpha}^{\pm} \mid ue \in UC \text{ restricting } \widehat{\alpha}^{\pm} \}$ as dom (UC).

However, in the subtyping, we need to consider more general kind of constraints. Specifically, subtyping constraint entries can restrict a variable not only to be equivalent to a certain type, but also to be a supertype of a positive type.

Definition 20 (Subtyping Constraint).

 subtyping entry (denoted as *e*) is an expression of shape $\widehat{\alpha}^+ : \ge P$, $\widehat{\alpha}^- : \simeq N$, or $\widehat{\alpha}^+ : \simeq P$;

subtyping constraint (denoted as C) is a set of subtyping constraint entries. We denote $\{\widehat{\alpha}^{\pm} \mid e \in C \text{ restricting } \widehat{\alpha}^{\pm} \}$ as dom (C).

Definition 21 (Well-formed Constraint Entry). We say that a constraint entry is well-formed in a context Θ if its associated type is well-formed in Θ .

$$\Theta \vdash \widehat{\alpha}^+ : \geqslant P \text{ iff } \Theta \vdash P;$$

 $\Theta \vdash \widehat{\alpha}^+ : \simeq P \text{ iff } \Theta \vdash P;$
 $\Theta \vdash \widehat{\alpha}^- : \simeq N \text{ iff } \Theta \vdash N.$

Definition 22 (*Well-formed Constraint*). We say that a constraint is well-formed in an instantiation context Ξ if all its entries are well-formed in the corresponding elements of Ξ . More formally, $\Xi \vdash C$ holds iff for every $e \in C$, such that e restricts $\widehat{\alpha}^{\pm}$, we have $\Xi(\widehat{\alpha}^{\pm}) \vdash e$.

We write $\Xi \vdash C : \widehat{\Theta}$ to denote that $\Xi \vdash C$ and dom $(C) = \widehat{\Theta}$.

 $\Xi \vdash UC$ and $\Xi \vdash UC : \widehat{\Theta}$ are defined analogously.

Constraint Satisfaction. A constraint entry restricts a type that can be assigned to a variable. We say that a type satisfies a constraint entry if it can be assigned to the variable restricted by the entry.

Definition 23 (Type Satisfying a Constraint Entry).

We say that a substitution satisfies a constraint—a set of constraint entries if each entry is satisfied by the type assigned to the variable by the substitution.

Definition 24 (Substitution Satisfying a Constraint). We write $\Xi \vdash \widehat{\sigma} : C$ to denote that a substitution $\widehat{\sigma}$ satisfies a constraint C in a context Ξ . It presumes that $\Xi \vdash C$ and means that for any $ue \in C$, if ue restricts $\widehat{\alpha}^{\pm}$, then $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm} : ue$.

Unification constraint satisfaction $\Xi \vdash \widehat{\sigma} : UC$ is defined analogously as a special case of subtyping constraint satisfaction.

Notice that $\Xi \vdash \widehat{\sigma} : C$ does not imply the signature $\Xi \vdash \widehat{\sigma} : \mathsf{dom}(C)$, because the latter also specifies $\widehat{\sigma}$ outside of the domain $\mathsf{dom}(C)$ (see Definition 16).

Constraint Merge. In this section, define the least upper bound for constraints, which we call merge. Intuitively, the merge of two constraints is the least constraint such that any substitution satisfying both constraints satisfies the merge as well. First, we define the merge of entries, and then extend it to the set of entries.

Definition 25 (*Matching Entries*). We call two unification constraint entries or two subtyping constraint entries matching if they are restricting the same unification variable.

Two matching entries formed in the same context Θ can be merged in the following way:

Algorithm 8 (Merge of Matching Constraint Entries).

 $\Theta \vdash e_1 \& e_2 = e_3$ Subtyping Constraint Entry Merge

$$\begin{split} &\frac{\Theta \models P_1 \lor P_2 = Q}{\Theta \vdash (\widehat{\alpha}^+ : \geqslant P_1) \& (\widehat{\alpha}^+ : \geqslant P_2) = (\widehat{\alpha}^+ : \geqslant Q)} \ (\geqslant \&^+ \geqslant) \\ &\frac{\Theta ; \; \cdot \models P \geqslant Q \; \exists \; \cdot}{\Theta \vdash (\widehat{\alpha}^+ : \simeq P) \& (\widehat{\alpha}^+ : \geqslant Q) = (\widehat{\alpha}^+ : \simeq P)} \ (\simeq \&^+ \geqslant) \\ &\frac{\Theta ; \; \cdot \models Q \geqslant P \; \exists \; \cdot}{\Theta \vdash (\widehat{\alpha}^+ : \geqslant P) \& (\widehat{\alpha}^+ : \simeq Q) = (\widehat{\alpha}^+ : \simeq Q)} \ (\geqslant \&^+ \simeq) \\ &\frac{\inf (P) = \inf (P')}{\Theta \vdash (\widehat{\alpha}^+ : \simeq P) \& (\widehat{\alpha}^+ : \simeq P') = (\widehat{\alpha}^+ : \simeq P)} \ (\simeq \&^+ \simeq) \\ &\frac{\inf (N) = \inf (N')}{\Theta \vdash (\widehat{\alpha}^- : \simeq N) \& (\widehat{\alpha}^- : \simeq N') = (\widehat{\alpha}^- : \simeq N)} \ (\simeq \&^- \simeq) \end{split}$$

- (\simeq &⁺ \simeq) and (\simeq &⁻ \simeq) are symmetric cases. To merge two matching entries restricting a variable to be equivalent to certain types, we check that these types are equivalent to each other. To do so, it suffices to check for *equality* of their normal forms, as discussed in Section 1.2.6. After that, we return the left-hand entry.
- (≈ &+ ≥) and (≥ &+ ≈) are also symmetric. In this case, since one of the entries requires the variable to be equal to a type, the resulting entry must also imply that. However, for the soundness, it is needed to ensure that the equating restriction is stronger than the subtyping restriction. For this purpose, the premise invokes the positive subtyping.

• (≥ &+ ≥) In this case, we find the least upper bound of the types from the input restrictions, and as the output, restrict the variable to be a supertype of the result. The least upper bound procedure will be discussed in Section 1.2.10.

Unification constraint entries are a special case of subtyping constraint entries. They are merged using the same algorithm (Algorithm 8). Notice that the merge of two matching unification constraint entries is a unification constraint entry.

Lemma 1 (Merge of Matching Unification Constraint Entries is well-defined). Suppose that $\Theta \vdash ue_1$ and $\Theta \vdash ue_2$ are unification constraint entries. Then the merge of ue_1 and $ue_2 \Theta \vdash ue_1 \& ue_2 = ue$ according to Algorithm 8, is a unification constraint entry.

Proof. Since ue_1 and ue_2 are matching unification constraint entries, they have the shape $(\widehat{\alpha}^+ := P_1, \widehat{\alpha}^+ := P_2)$ or $(\widehat{\alpha}^- := N_1, \widehat{\alpha}^- := N_2)$. Then the merge of ue_1 and ue_2 can only be defined by $(= \&^+ =)$ or $(= \&^- =)$. In both cases the result, if it exists, is a unification constraint entry: in the first case, the result has shape $\widehat{\alpha}^+ := P_1$, in the second case, the result has shape $\widehat{\alpha}^- := N_1$.

Algorithm 9 (*Merge of Subtyping Constraints*). Suppose that $\Xi \vdash C_1$ and $\Xi \vdash C_2$. Then $\Xi \vdash C_1 \& C_2 = C$ defines a set of constraints C such that $e \in C$ iff either:

• $e \in C_1$ and there is no matching $e' \in C_2$; or

- $e \in C_2$ and there is no matching $e' \in C_1$; or
- $\Xi(\widehat{\alpha}^{\pm}) \vdash e_1 \& e_2 = e$ for some $e_1 \in C_1$ and $e_2 \in C_2$ such that e_1 and e_2 both restrict variable $\widehat{\alpha}^{\pm}$.

Unification constraints can be considered as a special case of subtyping constraints, and the merge of unification constraints is defined as the merge of subtyping constraints. Then it is easy to see that the merge of two unification constraints is a unification constraint.

Lemma 2 (Merge of Unification Constraints is well-defined). Suppose that $\Xi \vdash UC_1$ and $\Xi \vdash UC_2$ are unification constraints. Then the merge of UC_1 and $UC_2 \equiv \vdash UC_1 \& UC_2 = UC$ according to Algorithm 9, is a unification constraint.

Proof. UC consists of unmatched entries of UC_1 and UC_2 , which are *unification* constraint entries by assumption, and merge of matching entries, which also are *unification* constraint entries by Lemma 1.

Lemmas 89 and 91 show the correctness and initiality of the merge operation, which can be expressed in the following simplified theorem:

Theorem (Correctness of Constraint Merge). A substitution $\widehat{\sigma}$ satisfying both constraints C_1 and C_2 if and only if it satisfies their merge.

The unification constraint merge satisfies the same theorem, however, because the merge of unification constraint entries ue_1 and ue_2 always results in one of them, a stronger soundness property holds (see Lemma 69):

Theorem (Soundness of Unification Constraint Merge). If $\Xi \vdash UC_1 \& UC_2 = UC$ then $UC = UC_1 \cup UC_2$.

1.2.9 *Unification.* The subtyping algorithm calls the following subtask: given two algorithmic types, we need to find the most general substitution for the algorithmic variables in these types, such that the resulting types are equivalent. This problem is known as *unification*.

In our case, the unification is restricted in the following way: first, before unifying the types, we normalize them, which allows us to reduce (non-trivial) equivalence to (trivial) equality; second, we preserve invariants which guarantee that one side of the unification is always declarative, which in fact, reduces the unification to the *matching* problem.

The unification procedure returns a set of minimal constraints, that must be satisfied by a substitution unifying the input types.

Algorithm 10 (Unification).

$$\Theta; \Xi \models N \stackrel{u}{\simeq} M \dashv UC \quad \text{Negative unification} \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad \text{Positive unification} \\
\frac{\Theta; \Xi \models R \stackrel{u}{\simeq} \alpha \dashv + \cdot \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\uparrow^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\uparrow^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\uparrow^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\uparrow^{u}) \quad \qquad \Theta; \Xi \models N \stackrel{u}{\simeq} M \dashv UC \quad (\downarrow^{u}) \quad \qquad \Theta; \Xi \models N \stackrel{u}{\simeq} M \dashv UC \quad (\downarrow^{u}) \quad \qquad \Theta; \Xi \models N \stackrel{u}{\simeq} M \dashv UC \quad (\downarrow^{u}) \quad \qquad \Theta; \Xi \models N \stackrel{u}{\simeq} M \dashv UC \quad (\downarrow^{u}) \quad \qquad \Theta; \Xi \models N \stackrel{u}{\simeq} M \dashv UC \quad (\downarrow^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\downarrow^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\downarrow^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel{u}{\simeq} Q \dashv UC \quad (\exists^{u}) \quad \qquad \Theta; \Xi \models P \stackrel$$

- $(\uparrow^{\stackrel{\square}{=}}), (\downarrow^{\stackrel{\square}{=}}), (\forall^{\stackrel{\square}{=}})$, and $(\exists^{\stackrel{\square}{=}})$ are defined congruently. In the shift rules, the algorithm removes the outermost constructor. In the \forall and \exists rules, it removes the quantifiers, adding the quantified variables to the context Θ . Notice that Ξ , which specifies the contexts in which the algorithmic variables must be instantiated, is not changed.
- $(VAR_{-}^{\frac{u}{2}})$ and $(VAR_{+}^{\frac{u}{2}})$ are the base cases. Since the sides are equal and free from algorithmic variables, the unification returns an empty constraint.
- $(VAR_{-}^{\frac{u}{2}})$ and $(VAR_{+}^{\frac{u}{2}})$ are symmetric cases constructing the constraints. When an algorithmic variable is unified with a type, we must check that the type is well-formed in the required context, and if it is, we return a constraint restricting the variable to be equivalent to that type.
- (→²). In this case, the algorithm makes two recursive calls: it unifies the arguments and the results of the arrows. After that, the resulting constraints are merged using the *unification*

constraint merge procedure, which is discussed in Section 1.2.8. Notice that UC_1 and UC_2 are guaranteed to be *unification* constraints, not arbitrary *subtyping* constraints: it is important for modularizing the proofs, since the properties of the *unification* constraint merge can be proved independently from the *subtyping* constraint merge.

1.2.10 Least Upper Bound. In this section, we present the algorithm finding the least common supertype of two positive types. It is used directly by the constraint merge procedure (Section 1.2.8), and indirectly, through the type upgrade by positive subtyping (Section 1.2.7). Perhaps, the least upper bound is the least intuitive part of the algorithm, and its correctness will be covered in Section 3.3.8.

Algorithm 11 (*The Least Upper Bound Algorithm*). $\Theta \models P_1 \lor P_2 = Q$ Least Upper Bound

$$\frac{\Theta, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{-}} \models P_{1} \lor P_{2} = Q}{\Theta \models \overrightarrow{\exists \alpha^{-}}. P_{1} \lor \overrightarrow{\beta^{-}}. P_{2} = Q} (\exists^{\vee})$$

$$\overline{\Theta \models \alpha^{+} \lor \alpha^{+} = \alpha^{+}} (VAR^{\vee})$$

$$\underline{\Theta \models \text{nf} (\downarrow N) \stackrel{a}{\simeq} \text{nf} (\downarrow M) = (\widehat{\Theta}, P, \widehat{\tau}_{1}, \widehat{\tau}_{2})}$$

$$\underline{\Theta \models \downarrow N \lor \downarrow M = \overrightarrow{\exists \alpha^{-}}. [\overrightarrow{\alpha^{-}}/\widehat{\Theta}] P} (\downarrow^{\vee})$$

- (VAR^V) The base case is trivial: the least upper bound of to equal variables is the variable itself.
- (\downarrow^{\vee}) In case both sides of the least upper bound are shifted, the algorithm needs to find the anti-unifier of them. Intuitively, this is because in general, the upper bounds of $\downarrow N$ are $\exists \overrightarrow{\alpha}$. P such that $\overrightarrow{\alpha}$ can be instantiated with some \overrightarrow{M} so that $\Theta \vdash [\overrightarrow{M}/\overrightarrow{\alpha}]P \cong ^{\leqslant} \downarrow N$ (see Lemma 77).
- (\exists^{\vee}) In this case, we move the quantified variables to the context Θ , and make a recursive call. It is important to make sure that $\overrightarrow{\alpha}$ and $\overrightarrow{\beta}$ are disjoint. In this case, it is guaranteed that the resulting $\forall v (Q)$ will be free of $\overrightarrow{\alpha}$ and $\overrightarrow{\beta}$, and thus, the resulting type will be a supertype of both sides (it will be discussed in Lemma 77).

In the positive subtyping algorithm (Section 1.2.7), (UVAR^{\gg}) generates a restriction of a variable $\widehat{\alpha}^+$. On the one hand, this restriction must imply $\widehat{\alpha}^+ : \gg P$ for the subtyping to hold. On the other hand, the type used in this restriction must be well-formed in a potentially stronger (smaller) context than P.

To resolve this problem, we define the *upgrade* procedure, which for given Θ_0 , $\overrightarrow{\alpha^{\pm}}$, and Θ_0 , $\overrightarrow{\alpha^{\pm}} \vdash P$, finds $\Theta_0 \vdash Q$ —the least supertype of P among the types well-formed in Θ_0 .

The trick is to make sure that the 'forbidden' variables $\overrightarrow{\alpha^{\pm}}$ are not used explicitly in the supertypes of P. For this purpose, we construct new types P_1 and P_2 , in each of them replacing the forbidden variables with fresh variables $\overrightarrow{\beta^{\pm}}$ and $\overrightarrow{\gamma^{\pm}}$, and then find the least upper bound of P_1 and P_2 . It turns out that this renaming forces the common types of P_1 and P_2 to be agnostic to $\overrightarrow{\alpha^{\pm}}$, and thus,

the supertypes of P well-formed in Θ_0 are exactly the common supertypes of P_1 and P_2 . These properties are considered in more details in Section 3.3.9.

Algorithm 12 (Type Upgrade).

 upgrade $\Theta \vdash P$ to $\Theta_0 = Q$ Type Upgrade

$$\begin{split} & \overset{\Theta}{\xrightarrow{\beta^{\pm}}} = \Theta_{0}, \overrightarrow{\alpha^{\pm}} \\ & \overrightarrow{\beta^{\pm}} \text{ are fresh } \overrightarrow{\gamma^{\pm}} \text{ are fresh } \\ & \overset{\Theta_{0}}{\xrightarrow{\beta^{\pm}}}, \overrightarrow{\gamma^{\pm}} \models [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}] \overset{P}{\nearrow} \lor [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}] \overset{P}{\nearrow} = \overset{Q}{Q} \\ & \text{upgrade } \Theta \vdash \overset{P}{\nearrow} \text{ to } \Theta_{0} = \overset{Q}{Q} \end{split}$$

Note on the Greatest Lower Bound. In contrast to the least upper bound, the general greatest lower bound does not exist in our system. For instance, consider a positive type P, together with its non-equivalent supertypes P_1 and $P_2 \not= P_1$ (for example, $P = \downarrow \uparrow \downarrow \gamma^-$, $P_1 = \exists \alpha^-, \downarrow \uparrow \downarrow \alpha^-$, and $P_2 = \exists \alpha^-, \downarrow \alpha^-$). Then for arbitrary Q and N, let us consider the common subtypes of $A = Q \to \downarrow \uparrow Q \to \downarrow \uparrow Q \to N$ and $B = P \to \downarrow \uparrow P_1 \to \downarrow \uparrow P_2 \to N$. It is easy to see that $\forall \alpha^+, \forall \beta^+, \alpha^+ \to \downarrow \uparrow \alpha^+ \to N$ and $\forall \alpha^+, \forall \beta^+, \alpha^+ \to \downarrow \uparrow \alpha^+ \to N$ are both maximal common subtypes of A and B, and since they are not equivalent, none of them is the greatest one.

However, we designed the subtyping system in such a way that the greatest lower bound is not needed: the negative variables are always 'protected' by *invariant* shifts (\uparrow and \downarrow), and thus, the algorithm can only require a substitution of a negative variable to be *equivalent* to some type but never to be a *subtype*.

1.2.11 Anti-unification. Next, we define the anti-unification procedure, also known as the *most specific generalization*. As an input, it takes two declarative types (e.g., in the positive case P_1 and P_2) and a context Θ . and returns a type Q—the generalizer, containing negative placeholders (represented by algorithmic variables) from $\widehat{\Theta}$ and two substitutions $\widehat{\tau}_1$ and $\widehat{\tau}_2$. The substitutions replace the placeholders with declarative types well-formed in Θ , such that $[\widehat{\tau}_1]Q = P_1$ and $[\widehat{\tau}_2]Q = P_2$. Moreover, the algorithm guarantees that Q is the most specific type with this property: any other generalizer can be turned into Q by some substitution $\widehat{\rho}$.

It is important to note the differences between the standard anti-unification and our version. First, we only allow the placeholders at *negative* positions, which means, for example, that α^+ and β^+ cannot be generalized. Second, the generated pair of substitutions $\hat{\tau}_1$ and $\hat{\tau}_2$ must replace the placeholders with types well-formed in a specified context Θ .

The anti-unification algorithm assumes that the input types are normalized. This way, antiunification up-to-equality rather than anti-unification up-to-equivalence is sufficient.

Algorithm 13 (Anti-unification).

$$\begin{split} \Theta \vDash P_1 \overset{a}{\simeq} P_2 \preccurlyeq (\widehat{\Theta}, \ensuremath{\mathbb{Q}}, \widehat{\tau}_1, \widehat{\tau}_2) \\ \\ & \frac{}{\Theta \vDash \alpha^+ \overset{a}{\simeq} \alpha^+ \preccurlyeq (\cdot, \alpha^+, \cdot, \cdot)} \ensuremath{\left(\operatorname{Var}_+^a \right)}^a \end{split}$$

 $\frac{\Theta \models N_1 \stackrel{a}{\cong} N_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)}{\Theta \models \bigcup N_1 \stackrel{a}{\cong} \bigcup N_2 \dashv (\widehat{\Theta}, \bigcup M, \widehat{\tau}_1, \widehat{\tau}_2)} (\downarrow^{\stackrel{a}{\cong}})$ $\frac{\overrightarrow{\alpha} \cap \Theta = \emptyset \quad \Theta \models P_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, \bigcup \widehat{\tau}_1, \widehat{\tau}_2)}{\Theta \models \exists \overrightarrow{\alpha} \cdot P_1 \stackrel{a}{\cong} \exists \overrightarrow{\alpha} \cdot P_2 \dashv (\widehat{\Theta}, \exists \overrightarrow{\alpha} \cdot Q, \widehat{\tau}_1, \widehat{\tau}_2)} (\exists^{\stackrel{a}{\cong}})$ $\overline{\Theta \models N_1 \stackrel{a}{\cong} N_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)}$ $\frac{\Theta \models N_1 \stackrel{a}{\cong} N_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)}{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2))} (\forall AR_{\stackrel{a}{\cong}})$ $\overline{\Theta \models P_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models P_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} N_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)} (\uparrow^{\stackrel{a}{\cong}})$ $\overline{\Theta \models (A_1 \stackrel{a}{\cong} P_2 \dashv (\widehat{$

- (VAR^a₊) and (VAR^a₋) are the base cases. In this case, since the input types are equal, the algorithm returns this type as a generalizer, without generating any placeholders.
- $(\downarrow^{\frac{\alpha}{2}}), (\uparrow^{\frac{\alpha}{2}}), (\forall^{\frac{\alpha}{2}})$, and $(\exists^{\frac{\alpha}{2}})$ are defined congruently. In the shift rules, the algorithm removes the outermost constructor. In the \forall and \exists rules, it removes the quantifiers. Notice that the algorithm does not add the removed variables to the context Θ . This is because Θ is used to restrict the resulting anti-unification substitutions, and is fixed throughout the algorithm.
- (AU) is the most important rule, since it generates the placeholders. This rule only applies if other negative rules failed. Because of that, the anti-unification procedure is *not* syntax-directed.
 - The generated placeholder is indexed with a pair of types it is mapped to. It allows the algorithm to automatically unite the anti-unification solutions generated by the different branches of $(\rightarrow^{\stackrel{a}{\simeq}})$.
 - Notice that this rule does not have a positive counterpart, since we only allow negative placeholders.
- $(\to^{\stackrel{a}{\simeq}})$ makes two recursive calls to the anti-unification procedure, and unites the results. Suppose that $\widehat{\tau}_1$ and $\widehat{\tau}_2$ are the substitutions generated by anti-unification of *argument* types of the arrow, and $\widehat{\tau}_1'$ and $\widehat{\tau}_2'$ are the substitutions generated by anti-unification of *result* types of the arrow. It is important that if $(\widehat{\tau}_1, \widehat{\tau}_2)$ and $(\widehat{\tau}_1', \widehat{\tau}_2')$ send some variables to the same pair of types, i.e., $[\widehat{\tau}_1]\widehat{\alpha}^- = [\widehat{\tau}_1']\widehat{\beta}^-$ and $[\widehat{\tau}_2]\widehat{\alpha}^- = [\widehat{\tau}_2']\widehat{\beta}^-$, then these variables are equal, i.e., $\widehat{\alpha}^- = \widehat{\beta}^-$. This property is guaranteed by (AU): the name of the placeholder is determined by the pair of types it is mapped to.

1028 1029 In the previous section, we presented the type system together with the subtyping specification and the algorithm. In this section, we describe the language under this type system, together with the type inference specification and algorithm.

1.3.1 Grammar. The syntax of F_{\exists}^{\pm} terms is given by the following grammar:

Definition 26 (Grammar of Terms).

Computation Terms

```
c, d
              ::=
                      (c:N)
                      \lambda x : P. c
                                                                                       Value Terms
                      \Lambda \alpha^+. c
                                                                                       v, w
                      return v
                                                                                                               \boldsymbol{x}
                      let x = v; c
                                                                                                               {c}
                      let x : P = c; c'
                                                                                                               (v:P)
                      let x : P = v(\overrightarrow{v}); c
               1
                      let x = v(\overrightarrow{v}); c
                      let^{\exists}(\overrightarrow{\alpha}, x) = v; c
```

Notice that the language does not have first-class applications: instead, we use applicative let bindings—constructions that bind a result of a fully applied function to a (positive) variable. In the call-by-push-value paradigm, it corresponds to monadic bind or do-notation. Typewise, these let-binders come in two forms: annotated and unannotated. The annotated let-binders let $x : P = v(\vec{v})$; c requires the application to infer the annotated P, whereas the unannotated let $x = v(\vec{v})$; c is used when the inferred type is unique.

A computation of a polymorphic type is constructed using $\Lambda \alpha^+$. c, however, the elimination of \forall is implicit. Conversely, the existential types are constructed implicitly and eliminated using the standard unpack mechanism: $let^{\exists}(\overrightarrow{\alpha}^-, x) = v$; c.

Another dual pair of constructions are return v and $\{c\}$. The former allows us to embed a value in pure computations. The latter, on the contrary, encapsulates a thunk of computation in a value.

Finally, the language has several standard constructions: lambda-abstractions $\lambda x : P$. c, standard let-bindings let x = v; c, and type annotations that can be added to any value or computation: (v : P) and (c : N).

1.3.2 Declarative Type Inference. Next, we define the specification of the type inference for our language. First, we introduce variable context specifying the types of variables in the scope of the current rule.

Definition 27 (*Variable Context*). The variable typing context Γ is represented by a set of entries of the form x : P.

The specification is represented by an inference system of three mutually recursive judgments: positive inference Θ ; $\Gamma \vdash \nu$: P, negative type inference Θ ; $\Gamma \vdash c$: N, and application type inference Θ ; $\Gamma \vdash N \bullet \overrightarrow{v} \implies M$. In the premises, the inference rules also refer to the declarative subtyping (Definition 10), type well-formedness (Algorithm 1), and normalization (Algorithm 5).

- Θ ; $\Gamma \vdash \nu$: P (and symmetrically, Θ ; $\Gamma \vdash c$: N) means that under the type context Θ and the variable context Γ , for the value ν , type P is inferrable. It guarantees that ν is well-formed in Θ and Γ in the standard sense.
- Θ ; $\Gamma \vdash N \bullet \overrightarrow{v} \implies M$ is the application type inference judgment. It means that if a head of type N is applied to list of values \overrightarrow{v} , then the resulting computation can be typed as M.

Definition 28 (Declarative Type Inference).

 Θ ; $\Gamma \vdash c$: *N* Negative typing

$$\frac{\Theta \vdash P \quad \Theta; \Gamma, x : P \vdash c : N}{\Theta; \Gamma \vdash \lambda x : P \cdot c : P \rightarrow N} (\lambda^{\text{INF}})$$

$$\frac{\Theta; \Gamma \vdash \lambda x : P \cdot c : N}{\Theta; \Gamma \vdash \lambda x : P \cdot c : N} (\Lambda^{\text{INF}})$$

$$\frac{\Theta; \Gamma \vdash \nu : P}{\Theta; \Gamma \vdash \lambda x : P \cdot c : N} (\text{RET}^{\text{INF}})$$

$$\frac{\Theta; \Gamma \vdash \nu : P}{\Theta; \Gamma \vdash c : N} (\text{VAR}^{\text{INF}})$$

$$\frac{\Theta; \Gamma \vdash \nu : P}{\Theta; \Gamma \vdash \nu : P} (\text{VAR}^{\text{INF}})$$

$$\frac{\Theta; \Gamma \vdash \nu : P}{\Theta; \Gamma \vdash \nu : P} (\text{VAR}^{\text{INF}})$$

$$\frac{\Theta; \Gamma \vdash \nu : P}{\Theta; \Gamma \vdash \nu : P} (\text{VAR}^{\text{INF}})$$

$$\frac{\Theta; \Gamma \vdash \nu : P}{\Theta; \Gamma \vdash \nu : P} (\text{VAR}^{\text{INF}})$$

$$\frac{\Theta; \Gamma \vdash \nu : P}{\Theta; \Gamma \vdash \nu : P} (\text{VAR}^{\text{INF}})$$

$$\frac{\Theta; \Gamma \vdash \nu : P}{\Theta; \Gamma \vdash \nu : P} (\text{VAR}^{\text{INF}})$$

$$\frac{\Theta; \Gamma \vdash \nu : P}{\Theta; \Gamma \vdash \nu : P} (\text{VAR}^{\text{INF}})$$

$$\frac{\Theta : \Gamma \vdash N \bullet \overrightarrow{v} \Longrightarrow M}{\Theta : \Gamma \vdash N \bullet \cdot \overrightarrow{v} \Longrightarrow M} \text{ Application typing}$$

$$\frac{\Theta \vdash N \simeq^{\leq} N'}{\Theta : \Gamma \vdash N \bullet \cdot \Longrightarrow N'} (\emptyset^{\text{INF}}_{\bullet \Longrightarrow})$$

$$\frac{\Theta : \Gamma \vdash V : P \quad \Theta \vdash Q \geqslant P}{\Theta : \Gamma \vdash N \bullet \overrightarrow{v} \Longrightarrow M} (\to^{\text{INF}}_{\bullet \Longrightarrow})$$

$$\frac{\Theta : \Gamma \vdash V : P \quad \Theta \vdash Q \geqslant P}{\Theta : \Gamma \vdash V \Longrightarrow M} (\to^{\text{INF}}_{\bullet \Longrightarrow})$$

$$\frac{\Theta : \Gamma \vdash V : P \quad \Theta \vdash Q \geqslant P}{\Theta : \Gamma \vdash V \Longrightarrow M} (\to^{\text{INF}}_{\bullet \Longrightarrow})$$

Let us discuss the selected rules of the declarative system:

- (VAR^{INF}) says that the type of a variable is inferred from the context.
- ({}^{INF}) says that the type of a thunk is inferred by shifting up the type of the contained computation. Symmetrically, (RET^{INF}) infers the type of a return by shifting down the type of the contained value.
- (ANN₊^{INF}) and (ANN₋^{INF}) are symmetric. They allow the inferred type to be refined by annotating it with a supertype.
- (\simeq_{-}^{INF}) and (\simeq_{+}^{INF}) mean that the declarative system allows us to infer any type from the equivalence class.
- (LET_{\exists}^{INF}) is standard for existential types, and its first premise infers the existential type of the value being unpacked. It is important however that the inferred existential type is normalized. This is because there might be multiple equivalent existential types with a different order or even number of quantified variables, and to bind them, the algorithm needs to fix the canonical one.
- (LET_{:@}^{INF}) allows us to type the *annotated* applicative let-binders. The first premise infers the type of the head of the application, which must be a thunked computation. Then if after applying it to the arguments, the resulting type can be instantiated to the annotated one, we infer the body of the let-binding in the context extended with the bound variable.
- (LET_@) is similar to (LET_:\(\text{NF}\)), bus is used for unannotated let-bindings. In this case, we require the type application to infer the 'canonical' principal type. Θ ; $\Gamma \vdash M \bullet \overrightarrow{v} \implies \uparrow Q$ principal means that any other type Q' inferrable for the application (i.e., Θ ; $\Gamma \vdash M \bullet \overrightarrow{v} \implies \uparrow Q'$) is greater than the principal type Q, i.e., $\Theta \vdash Q' \geqslant Q$.

Let us discuss the rules of the application inference:

- $(\emptyset_{\bullet \Rightarrow}^{\text{INF}})$ is the base case. If the list of arguments is empty, the inferred type is the type of the head. However, we relax this specification by allowing it to infer any other equivalent type. The relaxation of this rule is enough to guarantee this property for the whole judgement: if Θ ; $\Gamma \vdash N \bullet \overrightarrow{v} \implies M$ then Θ ; $\Gamma \vdash N \bullet \overrightarrow{v} \implies M'$ for any equivalent M'.
- $(\rightarrow_{\bullet \Rightarrow}^{\text{INF}})$ is where the application type is inferred: if the head has an arrow type $Q \to N$, we are allowed to apply it as soon as as soon as the first argument has a type, which is a subtype of Q.
- $(\forall_{\bullet \to}^{\text{INF}})$ is the rule ensuring the implicit elimination of the universal quantifiers. If we are applying a polymorphic computation, we can instantiate its quantified variables with any types, which is expressed by the substitution $\Theta \vdash \sigma : \overrightarrow{\alpha}^{+}$.

Although based on System F, F_{\exists}^{\pm} has an additional polarization structure. To demonstrate the relation between these systems we establish translations in both ways: the polarization from System F to F_{\exists}^{\pm} and the depolarization from F_{\exists}^{\pm} to System F. These translations are done at the level of types and terms, and the expected typing preservation properties are proved.

First, let us agree on the variant of System F that we use to establish the relation with F_{\exists}^{\pm} . At the type level, we have variables, functional arrows, and universal quantifiers, and define existential quantifiers as a syntactic sugar using standard encodings. At the term level, we have variables, unannotated lambda abstractions, type abstractions, and term-level applications, but not type applications (they can be done implicitly); for convenience, we introduce multi-argument applications, let-blinders, and existential constructors and eliminators as syntactic sugar (see Fig. 1).

$$\frac{x: T \in \Gamma}{\Theta; \Gamma \vdash x: T} \text{ (VAR}^{\mathsf{F}})$$

$$\frac{\Theta; \Gamma, x: A \vdash t: B}{\Theta; \Gamma \vdash \lambda x. t: A \to B} (\lambda^{\mathsf{F}})$$

$$\frac{\Theta; \Gamma \vdash t: A \to B \quad \Theta; \Gamma \vdash t': A}{\Theta; \Gamma \vdash tt': B} \text{ (App}^{\mathsf{F}})$$

$$\frac{\Theta; \Gamma \vdash t: \forall \alpha. T \quad \Theta \vdash A}{\Theta; \Gamma \vdash t: [A/\alpha]T} \text{ (TApp}^{\mathsf{F}})$$

Fig. 2. Typing rules of System F

$$\begin{aligned} & |\alpha^{+}| \equiv \alpha & |\alpha^{-}| \equiv \alpha \\ & |\downarrow N| \equiv |N| & |\uparrow P| \equiv |P| & |\downarrow \alpha \downarrow \exists \alpha^{+} \downarrow \forall \alpha . T \downarrow \exists \downarrow (\forall \alpha^{+} . \uparrow \downarrow T \downarrow) \\ & |\exists \alpha^{-} . P| \equiv \exists \overrightarrow{\alpha} . |P| & |\forall \alpha^{+} . N| \equiv \forall \alpha . |N| & |\downarrow A \rightarrow B \downarrow \equiv \downarrow (\downarrow A \downarrow \rightarrow \uparrow \downarrow B \downarrow) \end{aligned}$$

Fig. 3. Type Depolarization

Fig. 4. Type Polarization

Observation 1. The following rules are admissible in System F:

$$\begin{array}{c} \Theta; \Gamma \vdash t_{1} \colon \exists \overrightarrow{\alpha}. T \\ \Theta; \overrightarrow{\alpha}; \Gamma, x : T \vdash t_{2} \colon T' \\ \Theta \vdash T' \\ \hline \Theta; \Gamma \vdash \mathsf{unpack} (\overrightarrow{\alpha}, x) = t_{1} ; t_{2} \colon T' \end{array} (\mathsf{Unpack}^{\mathsf{F}}) \\ \hline \begin{array}{c} \Theta; \Gamma \vdash \mathsf{t} : A & \Theta; \Gamma, x : A \vdash t' \colon B \\ \hline \Theta; \Gamma \vdash \mathsf{let} \ x = t \colon t' \colon B \end{array} (\mathsf{Let}^{\mathsf{F}}) \\ \hline \end{array}$$

1.4.1 Type-level Translation. The translation between the types is defined in Fig. 3 and Fig. 4.

The depolarization—translation from F_{\exists}^{\pm} to System F—is straightforward: it recursively (i) removes the shift operators \uparrow and \downarrow , and (ii) removes the sign annotations from the type variables.

The polarization—translation from System F to F_{\exists}^{\pm} —is more complex. There exist several ways to define it since any System F type can be polarized either positively or negatively. We chose the positive translation: every term of System F is translated into a value. Although this translation does not minimize the number of inserted shifts, it is more straightforward to consistently lift it to the level of terms.

1.4.2 Term-level Translation. The term-level translation is defined not solely for terms, but for typing derivations (we call this translation *elaboration*). The reason for that is that the terms of System F and F_{\exists}^{\pm} contain different typing information that cannot be reconstructed without the appropriate derivation tree. For instance, the lambda expressions in System F do not have the bound variable annotation, while the lambda expressions in F_{\exists}^{\pm} do; on the other hand, F_{\exists}^{\pm} has richer subtyping, which cannot be expressed in in terms of polymorphic type instantiation of System F.

The elaboration $F_{\exists}^{\pm} \sim System F$ annotates each judgment of an F_{\exists}^{\pm} typing derivation tree with the corresponding System F term. This way, we define elaboration for each kind of judgment: subtyping, positive typing, negative typing, and application typing.

The subtyping elaboration is defined in Fig. 5. The soundness property that is preserved by the elaboration is stated in Lemma 52. Informally, $\Theta \vdash N \leq M \leadsto t$ guarantees that t is a System F term that represents a conversion (i.e., a function) from the depolarized |N| to |M|. Symmetrically, $\Theta \vdash P \geqslant Q \leadsto t$ implies $|\Theta|$; $\vdash t : |Q| \to |P|$.

- Rules (VAR

) and (VAR

) are trivial: if the left-hand side and the right-hand side types are
 the same, the function converting one to another is the identity.
- Rules (\uparrow_{\leqslant}) and (\downarrow_{\geqslant}) are symmetric. Since the shifts are removed during the depolarization, the conversion function is obtained by the recursive call to the premise representing the subtyping of the required order (the mutual subtyping equivalence is defined as two separate judgments). Notice that the subtyping in the other order is still required so that the removal of the elaboration produces a correct subtyping inference tree in the original F_{\exists}^{\ddagger} .
- Rule (\to_{\leq}^{\leadsto}) allows us to define elaboration between function. Since the subtyping is contravariant on the argument type and covariant on the result type, we can use the elaboration functions acquired in the premises (their types are $|Q| \to |P|$ and $|N| \to |M|$) to construct the required elaboration term of type $(|P| \to |N|) \to |Q| \to |M|$.
- Rules $(\forall^{\leadsto}_{\leqslant})$, and $(\exists^{\leadsto}_{\geqslant})$ are more involved. However, the soundness property is preserved by Observation 4 allowing one to distribute depolarization over the substitution whereby translating the instantiation substitution σ from F^{\pm}_{\exists} to System F.

Using the subtyping elaboration, we define the elaboration for the positive/negative typing and application typing in Fig. 6. The soundness property (Lemma 53) guarantees that if the initial term v has type P in F_{\exists}^{\pm} , then the result of the elaboration of this judgment t has type |P| in System F. The negative typing has a symmetric property. As with the subtyping elaboration, the rules in Fig. 6 are obtained from the F_{\exists}^{\pm} declarative typing rules (Definition 28) by annotating each judgment with the elaboration term so that the typing is preserved.

Fig. 7. Typing elaboration form from System F to F_{\exists}^{\pm}

The other direction of translation is also represented as an elaboration. The inference rules are defined in Fig. 7, and constitute the rules of System F (Fig. 2). annotated with the elaboration terms. The elaborated term is chosen in such a way that the soundness property (Lemma 56) holds: Θ ; $\Gamma \vdash t : T \leadsto^{\pm} c$ implies $\lfloor \Theta \rfloor$; $\lfloor \Gamma \rfloor \vdash c : \uparrow \lfloor T \rfloor$.

1.5 Algorithmic Typing

 Next, we present the type inference algorithm, which is sound and complete with respect to the declarative specification (Definition 28).

1.5.1 Algorithmic Type Inference. Mirroring the declarative typing, the algorithm is represented by an inference system of three mutually recursive judgments:

- Θ ; $\Gamma \models v : P$ and Θ ; $\Gamma \models c : N$ are the algorithmic versions of Θ ; $\Gamma \vdash v : P$ and Θ ; $\Gamma \vdash c : N$. In contrast with the declarative counterparts, they are deterministic, and guarantee that the inferred type is normalized.
- Θ ; Γ ; $\Xi_1 \models N$ $\overrightarrow{v} \implies M = \Xi_2$; C is the algorithmization of Θ ; $\Gamma \vdash N$ $\overrightarrow{v} \implies M$. Notice that N contains algorithmic variables, which are specified by the context Ξ_1 . Moreover, the inferred type M is also algorithmic, and can have several non-equivalent instantiations. To accommodate that, the algorithm also returns Ξ_2 and C specifying the variables used in M: Ξ_2 defines the contexts in which the variables must be instantiated, and C imposes restrictions on the variables.

As subroutines, the algorithm calls subtyping (Algorithm 7), type well-formedness (Algorithm 1), constraint merge (Section 1.2.8), normalization (Algorithm 5), and constraint singularity which will be defined later in Section 1.5.3. It also relies on basic set operations and the ability to deterministically choose fresh variables.

Let us discuss the inference rules of the algorithm:

- (VAR^{INF}) infers the type of a variable by looking it up in the context and normalizing the
 result.
- ({} INF) and (RET INF) are similar to the declarative rules: they make a recursive call to type the body of the thunk or the return expression and put the shift on top of the result.

 • (ANN^{INF}₊) and (ANN^{INF}₋) are symmetric. They make a recursive call to infer the type of the annotated expression, check that the inferred type is a subtype of the annotation, and return the normalized annotation.

- (λ^{INF}) infers the type of a lambda-abstraction. It makes a recursive call to infer the type of the body in the extended context, and returns the corresponding arrow type. Notice that the algorithm also normalizes the result, which is because the annotation type P is allowed to be non-normalized.
- (Λ^{INF}) infers the type of a big lambda. Similarly to the previous case, it makes a recursive call to infer the type of the body in the extended *type* context. After that, it returns the corresponding universal type. It is also required to normalize the result, because, for instance, α^+ might not occur in the body of the lambda, in which case the \forall must be removed.
- (LET^{INF}) is defined in a standard way: it makes a recursive call to infer the type of the bound value, and then returns the type of the body in the extended context.
- (LET: $^{\text{INF}}_{:@}$) is interpreted as follows. First, it infers the type of the head of the application, ensuring that it is a thunked computation $\downarrow M$; after that, it makes a recursive call to the application inference procedure, which returns the algorithmic type, whose instantiation to a declarative type must be associated with the bound variable x; then premise Θ ; $\Xi \models M' \leqslant \uparrow P \exists C_2$ together with $\Xi \vdash C_1 \& C_2 = C$ check whether the instantiation to the annotated type P is possible, and if it is, the algorithm infers the type of the body in the extended context, and returns it as the result.
- (LET_{@}^{INF}) works similarly to (LET_{:@}^{INF}), However, since there is no annotation to assign the result to, the algorithm must infer the 'canonical' principal type. To do that algorithmically, we ensure that the inferred algorithmic type Q is instantiated to the minimal possible type $[\widehat{\sigma}]Q$. The premise Q is C-minimized by $\widehat{\sigma}$ provides the minimal instantiation of Q w.r.t. C. It guarantees that if we consider all possible substitutions satisfying the inferred constraints C, then substitution $\widehat{\sigma}$ will instantiate Q to the minimal possible type $[\widehat{\sigma}]Q$. This will be the principal type that we assign to the result of the application (bound to the variable x) and then we infer the type of the body in the context extended with the bound variable $x : [\widehat{\sigma}]Q$.
- (Let \exists^{INF}) first, infers the existential type $\exists \overrightarrow{\alpha}$. P of the value being unpacked, and since the type is guaranteed to be normalized, binds the quantified variables with $\overrightarrow{\alpha}$. Then it infers the type of the body in the appropriately extended context and checks that the inferred type does not depend on $\overrightarrow{\alpha}$ by checking well-formedness $\Theta \vdash N$.

Finally, let us discuss the algorithmic rules of the application inference:

- (∅_{•→}^{INF}) is the base case. If the list of arguments is empty, the inferred type is the type of the head, and the algorithm returns it after normalizing.
- $(\longrightarrow_{\bullet \Longrightarrow}^{\text{INF}})$ is the main rule of algorithmic application inference. If the head has an arrow type $Q \to N$, we find C_1 —the minimal constraint ensuring that Q is a supertype of the first argument's type. Then we make a recursive call applying N to the rest of the arguments, and merge the resulting constraint with C_1
- (∀^{INF}_{•→}), analogously to the declarative case, is the rule ensuring the implicit elimination of the universal quantifiers. This is the place where the algorithmic variables are generated. The algorithm simply replaces the quantified variables α⁺ with fresh algorithmic variables α⁺, and makes a recursive call in the extended context.

The correctness of the algorithm consists of its soundness and completeness, which is proved by mutual induction in Lemmas 101 and 102. The simplified result is the following.

Theorem (Correctness of Algorithmic Typing (simplified)).

```
-\Theta; \Gamma \models c : N \text{ implies } \Theta; \Gamma \vdash c : N, \text{ and } \Theta; \Gamma \vdash c : N \text{ implies } \Theta; \Gamma \models c : \text{nf } (N);
 +\Theta; \Gamma \models v : P \text{ implies } \Theta; \Gamma \vdash v : P, \text{ and } \Theta; \Gamma \vdash v : P \text{ implies } \Theta; \Gamma \models v : \text{nf } (P).
```

1.5.2 Minimal Instantiation. The minimal instantiation algorithm is used to infer the type of the bound variable in the un-annotated applicative let-binders, as long as there exists a principal (minimal) type. Given a positive algorithmic type P and a set of constraints C, it finds the substitution $\widehat{\sigma}$ respecting C (i.e., $\Xi \vdash \widehat{\sigma} : C$) such that it instantiates P to the minimal type, in other words for any other substitution $\widehat{\sigma}'$ respecting C, we have $\Theta \vdash [\widehat{\sigma}']P \geqslant [\widehat{\sigma}]P$.

The minimal instantiation algorithm is defined as follows:

Algorithm 15 (Minimal Instantiation).

 \underline{P} is C-minimized by $\widehat{\sigma}$

$$\begin{split} &(\widehat{\alpha}^+:\geqslant P)\in C\\ \hline \widehat{\alpha}^+ \text{ is } C\text{-minimized by } (\text{nf } (P)/\widehat{\alpha}^+) \end{split} \text{(UVAR}^{\text{MIN}})\\ &\frac{P}{\exists \widehat{\alpha}^+}.P \text{ is } C\text{-minimized by } \widehat{\sigma}\\ \hline \frac{1}{\exists \widehat{\alpha}^+}.P \text{ is } C\text{-minimized by } \widehat{\sigma} \end{split} \text{(\exists^{MIN})}\\ &\text{fav}(P)\subseteq \text{dom}(C)\\ &\frac{C|_{\text{fav}(P)}}{\text{singular with } \widehat{\sigma}} \text{(sing}^{\text{MIN}}) \end{split}$$

1.5.3 Constraint Singularity. The singularity algorithm checks whether the constraint C uniquely defines the substitution satisfying it, and if it does, the algorithm returns this substitution as the result. To implement it, we define a partial function C singular with $\widehat{\sigma}$, taking a subtyping constraint C as an argument and returning a substitution $\widehat{\sigma}$ —the only possible solution of C.

First, we define the notion of singularity on constraint entries. e singular with P and its negative counterpart are considered partial functions taking a constraint entry e and returning the type satisfying e if such a type is unique.

Algorithm 16 (Singular Constraint Entry). [e singular with P]

e singular with N

 $\frac{}{\widehat{\alpha}^- :\simeq N \text{ singular with nf } (N)} \stackrel{(\simeq_-^{\text{SING}})}{}$

• (\simeq_{-}^{SING}) and (\simeq_{+}^{SING}) are symmetric. If the constraint entry says that a variable must be equivalent to a type T, then it is evidently singular, and the only (up-to-equivalence) type instantiating this variable could be T. This way, we return its normal form.

- (:> α^{SING}) implies that the only (normalized) solution of $\widehat{\alpha}^+$:> $\exists \overrightarrow{\alpha}^-$. α^+ is α^+ (it will be shown in Lemma 19).
- (: $\geqslant \downarrow^{\text{SING}}$) is perhaps the least obvious rule. Having a type $\exists \overrightarrow{\alpha}^{-}, \downarrow N$, suppose that N is not equivalent to any just bound variable $\alpha^{-}_{i} \in \overrightarrow{\alpha}^{-}$. Then the type $\exists \overrightarrow{\alpha}^{-}, \downarrow N$ has a proper supertype: $\exists \overrightarrow{\alpha}^{-}, \downarrow \alpha^{-}_{1}$, and thus the constraint is not singular. Otherwise, if N is equivalent to some α^{-}_{i} , any supertype of $\exists \overrightarrow{\alpha}^{-}, \downarrow \alpha^{-}_{i}$ is equivalent to it, and thus, the constraint has a unique solution.

Next, we extrapolate the singularity function on constraints—sets of constraint entries. We require C to be a set of singular constraints, and the resulting substitution sends each variable from dom(C) to the unique type satisfying the corresponding constraint.

Algorithm 17. C singular with $\widehat{\sigma}$ means that

- (1) for any positive $e \in C$, there exists P such that e singular with P, and for any negative $e \in C$, there exists N such that e singular with N;
- (2) $\hat{\sigma}$ is defined as follows:

$$[\widehat{\sigma}]\widehat{\beta}^{+} = \begin{cases} P & \text{if there is } e \in \text{dom}(C) \text{ restricting } \widehat{\beta}^{+} \text{ and } e \text{ singular with } P \\ \widehat{\beta}^{+} & \text{otherwise} \end{cases}$$

$$[\widehat{\sigma}]\widehat{\beta}^{-} = \begin{cases} N & \text{if there is } e \in \text{dom}(C) \text{ restricting } \widehat{\beta}^{-} \text{ and } e \text{ singular with } N \\ \widehat{\beta}^{-} & \text{otherwise} \end{cases}$$

The correctness of the singularity algorithm is formulated as follows:

Theorem. Suppose that C is a subtyping constraint. Then C singular with $\widehat{\sigma}$ holds if and only if $\widehat{\sigma}$ is the only (up-to-equivalence on dom (C)) normalized substitution satisfying C.

2 Theorem Statements

2.1.1 Type Well-Formedness.

 Lemma 3 (Soundness of type well-formedness).

Theorem Statements: Declarative

- + If $\Theta \vdash P$ then fy $(P) \subseteq \Theta$,
- - if Θ ⊢ N then fy (N) \subseteq Θ .

Lemma 4 (Completeness of type well-formedness). In the well-formedness judgment, only used variables matter:

- + if $\Theta_1 \cap f \vee P = \Theta_2 \cap f \vee P$ then $\Theta_1 \vdash P \iff \Theta_2 \vdash P$,
- $\text{ if } \Theta_1 \cap \text{ fv } N = \Theta_2 \cap \text{ fv } N \text{ then } \Theta_1 \vdash N \iff \Theta_2 \vdash N.$

Corollary 1 (Context Strengthening).

- + If $\Theta \vdash P$ then fy $(P) \vdash P$:
- - If $\Theta \vdash N$ then fy $(N) \vdash N$.

Corollary 2 (Well-formedness Context Weakening). Suppose that $\Theta_1 \subseteq \Theta_2$, then

- + if $\Theta_1 \vdash P$ then $\Theta_2 \vdash P$,
- − if Θ_1 \vdash *N* then Θ_2 \vdash *N*.

Lemma 5 (Well-formedness agrees with substitution). Suppose that $\Theta_2 \vdash \sigma : \Theta_1$. Then

- $+\Theta,\Theta_1\vdash P \text{ implies }\Theta,\Theta_2\vdash [\sigma]P, \text{ and }$
- $-\Theta, \Theta_1 \vdash N \text{ implies } \Theta, \Theta_2 \vdash [\sigma] N.$

2.1.2 Substitution.

> **Lemma 6** (Substitution strengthening). Restricting the substitution to the free variables of the substitution subject does not affect the result. Suppose that σ is a substitution, P and N are types. Then

- + $[\sigma]P = [\sigma|_{\mathsf{f} \vee P}]P$,
- $[\sigma]N = [\sigma|_{\mathsf{fv}\,N}]N$

Lemma 7 (Signature of a restricted substitution). If $\Theta_2 \vdash \sigma : \Theta_1$ then $\Theta_2 \vdash \sigma|_{vars} : \Theta_1 \cap vars$.

Lemma 8. Suppose that σ is a substitution with signature $\Theta_2 \vdash \sigma : \Theta_1$. Then if *vars* is disjoint from Θ_1 , then $\sigma|_{vars} = id$.

, Vol. 1, No. 1, Article . Publication date: July 2024.

Corollary 3 (Application of a disjoint substitution). Suppose that σ is a substitution with signature $\Theta_2 \vdash \sigma : \Theta_1$. Then

- + if $\Theta_1 \cap \text{fv}(Q) = \emptyset$ then $[\sigma]Q = Q$;
- $\text{ if } \Theta_1 \cap \text{ fv } (N) = \emptyset \text{ then } [\sigma] N = N.$

- + if $\Theta \vdash P_1 \geqslant P_2$ and $\Theta \vdash P_2 \geqslant P_3$ then $\Theta \vdash P_1 \geqslant P_3$.

Corollary 10 (*Transitivity of equivalence*). Assuming the types are well-formed in Θ ,

```
1814 - if \Theta \vdash N_1 \simeq^{\varsigma} N_2 and \Theta \vdash N_2 \simeq^{\varsigma} N_3 then \Theta \vdash N_1 \simeq^{\varsigma} N_3,

1815

1816 + if \Theta \vdash P_1 \simeq^{\varsigma} P_2 and \Theta \vdash P_2 \simeq^{\varsigma} P_3 then \Theta \vdash P_1 \simeq^{\varsigma} P_3.
```

2.1.4 Equivalence.

 Lemma 25 (*Declarative Equivalence is invariant under bijections*). Suppose μ is a bijection μ : $vars_1 \leftrightarrow vars_2$, then

- + $P_1 \simeq^D P_2$ implies $[\mu]P_1 \simeq^D [\mu]P_2$, and there exists an inference tree of $[\mu]P_1 \simeq^D [\mu]P_2$ with the same shape as the one inferring $P_1 \simeq^D P_2$;
- $-N_1 \simeq^D N_2$ implies $[\mu]N_1 \simeq^D [\mu]N_2$, and there exists an inference tree of $[\mu]N_1 \simeq^D [\mu]N_2$ with the same shape as the one inferring $N_1 \simeq^D N_2$.

Lemma 26. The set of free variables is invariant under equivalence.

```
- If N \simeq^D M then fv N = \text{fv } M (as sets)
```

+ If
$$P \simeq^D Q$$
 then fy $P = \text{fy } Q$ (as sets)

Lemma 27 (Declarative equivalence is transitive).

```
+ if P_1 \simeq^D P_2 and P_2 \simeq^D P_3 then P_1 \simeq^D P_3,
```

- if
$$N_1 \simeq^D N_2$$
 and $N_2 \simeq^D N_3$ then $N_1 \simeq^D N_3$.

Lemma 28 (*Type well-formedness is invariant under equivalence*). Mutual subtyping implies declarative equivalence.

```
+ \text{ if } \underline{P} \simeq^D \underline{Q} \text{ then } \Theta \vdash \underline{P} \iff \Theta \vdash \underline{Q},
```

- if
$$N \simeq^D M$$
 then $\Theta \vdash N \iff \Theta \vdash M$

Lemma 29 (Soundness of equivalence). Declarative equivalence implies mutual subtyping.

```
+ if \Theta \vdash P, \Theta \vdash Q, and P \simeq^D Q then \Theta \vdash P \simeq^{\leq} Q,
```

$$-$$
 if $\Theta \vdash N$, $\Theta \vdash M$, and $N \simeq^D M$ then $\Theta \vdash N \simeq^{\leqslant} M$.

Lemma 30 (Subtyping induced by disjoint substitutions). Suppose that $\Theta \vdash \sigma_1 : \Theta_1$ and $\Theta \vdash \sigma_2 : \Theta_1$, where $\Theta_i \subseteq \Theta$ and $\Theta_1 \cap \Theta_2 = \emptyset$. Then

```
- assuming \Theta \vdash N, \Theta \vdash [\sigma_1]N \leq [\sigma_2]N implies \Theta \vdash \sigma_i \simeq^{\leq} id : f \lor N
```

+ assuming
$$\Theta \vdash P$$
, $\Theta \vdash [\sigma_1]P \geqslant [\sigma_2]P$ implies $\Theta \vdash \sigma_i \simeq^{\leqslant} id : f \lor P$

Corollary 11 (Substitution cannot induce proper subtypes or supertypes). Assuming all mentioned types are well-formed in Θ and σ is a substitution $\Theta \vdash \sigma : \Theta$,

```
\begin{split} \Theta &\vdash [\sigma] N \leqslant N \implies \Theta \vdash [\sigma] N \simeq^{\leqslant} N \text{ and } \Theta \vdash \sigma \simeq^{\leqslant} \text{id} : \text{fv } N \\ \Theta &\vdash N \leqslant [\sigma] N \implies \Theta \vdash N \simeq^{\leqslant} [\sigma] N \text{ and } \Theta \vdash \sigma \simeq^{\leqslant} \text{id} : \text{fv } N \\ \Theta &\vdash [\sigma] P \geqslant P \implies \Theta \vdash [\sigma] P \simeq^{\leqslant} P \text{ and } \Theta \vdash \sigma \simeq^{\leqslant} \text{id} : \text{fv } P \\ \Theta &\vdash P \geqslant [\sigma] P \implies \Theta \vdash P \simeq^{\leqslant} [\sigma] P \text{ and } \Theta \vdash \sigma \simeq^{\leqslant} \text{id} : \text{fv } P \end{split}
```

Lemma 31 (*Mutual substitution and subtyping*). Assuming that the mentioned types (P, Q, N, and M) are well-formed in Θ and that the substitutions (σ_1 and σ_2) have signature $\Theta \vdash \sigma_i : \Theta$,

- + if $\Theta \vdash [\sigma_1]P \geqslant Q$ and $\Theta \vdash [\sigma_2]Q \geqslant P$ then there exists a bijection $\mu : \text{fv } P \leftrightarrow \text{fv } Q$ such that $\Theta \vdash \sigma_1 \simeq^{\leqslant} \mu : \text{fv } P$ and $\Theta \vdash \sigma_2 \simeq^{\leqslant} \mu^{-1} : \text{fv } Q$;
- if Θ ⊢ $[\sigma_1]N \le M$ and Θ ⊢ $[\sigma_2]N \le M$ then there exists a bijection μ : fv $N \leftrightarrow$ fv M such that Θ ⊢ $\sigma_1 \simeq^{\leqslant} \mu$: fv N and Θ ⊢ $\sigma_2 \simeq^{\leqslant} \mu^{-1}$: fv M.

Lemma 32 (Equivalent substitution act equivalently). Suppose that $\Theta' \vdash \sigma_1 : \Theta$ and $\Theta' \vdash \sigma_2 : \Theta$ are substitutions equivalent on their domain, that is $\Theta' \vdash \sigma_1 \simeq^{\leq} \sigma_2 : \Theta$. Then

+ for any $\Theta \vdash P$, $\Theta' \vdash [\sigma_1]P \simeq^{\leq} [\sigma_2]P$;

 - for any $\Theta \vdash N$, $\Theta' \vdash [\sigma_1]N \simeq^{\leqslant} [\sigma_2]N$.

Lemma 33 (Equivalence of polymorphic types).

- For $\Theta \vdash \forall \overrightarrow{\alpha^+}$. N and $\Theta \vdash \forall \overrightarrow{\beta^+}$. M, if $\Theta \vdash \forall \overrightarrow{\alpha^+}$. $N \simeq^{<} \forall \overrightarrow{\beta^+}$. M then there exists a bijection $\mu : \overrightarrow{\beta^+} \cap \text{fv } M \leftrightarrow \overrightarrow{\alpha^+} \cap \text{fv } N$ such that $\Theta, \overrightarrow{\alpha^+} \vdash N \simeq^{<} [\mu]M$,
- + For $\Theta \vdash \exists \overrightarrow{\alpha}^{-}$. P and $\Theta \vdash \exists \overrightarrow{\beta}^{-}$. Q, if $\Theta \vdash \exists \overrightarrow{\alpha}^{-}$. $P \simeq^{\leqslant} \exists \overrightarrow{\beta}^{-}$. Q then there exists a bijection $\mu : \overrightarrow{\beta}^{-} \cap \text{fv } Q \leftrightarrow \overrightarrow{\alpha}^{-} \cap \text{fv } P$ such that $\Theta, \overrightarrow{\beta}^{-} \vdash P \simeq^{\leqslant} [\mu]Q$.

Lemma 34 (*Completeness of Equivalence*). Mutual subtyping implies declarative equivalence. Assuming all the types below are well-formed in Θ :

- + if $\Theta \vdash P \simeq^{\leq} Q$ then $P \simeq^{D} Q$,
- if Θ \vdash *N* \simeq ^{\leqslant} *M* then *N* \simeq ^{*D*} *M*.

2.1.5 Variable Ordering.

Observation 2 (Ordering is deterministic). If ord $vars \operatorname{in} N = \overrightarrow{\alpha}_1$ and ord $vars \operatorname{in} N = \overrightarrow{\alpha}_2$ then $\overrightarrow{\alpha}_1 = \overrightarrow{\alpha}_2$. If ord $vars \operatorname{in} P = \overrightarrow{\alpha}_1$ and ord $vars \operatorname{in} P = \overrightarrow{\alpha}_2$ then $\overrightarrow{\alpha}_1 = \overrightarrow{\alpha}_2$. This way, we can use ord $vars \operatorname{in} N$ and as a function on N, and ord $vars \operatorname{in} P$ as a function on P.

Lemma 35 (Soundness of variable ordering). Variable ordering extracts used free variables.

 $- \text{ ord } vars \text{ in } N = vars \cap \text{ fv } N \text{ (as sets)}$

 + ord $varsin P = vars \cap fv P$ (as sets)

Corollary 12 (*Additivity of ordering*). Variable ordering is additive (in terms of set union) with respect to its first argument.

- ord $(vars_1 \cup vars_2)$ in $N = \text{ord } vars_1$ in $N \cup \text{ord } vars_2$ in N (as sets)
- + ord $(vars_1 \cup vars_2)$ in $P = \text{ord } vars_1$ in $P \cup \text{ord } vars_2$ in P (as sets)

Lemma 36 (*Weakening of ordering*). Only used variables matter in the first argument of the ordering,

- ord $(vars \cap fv N)$ in N = ord vars in N
- + ord $(vars \cap f \lor P)$ in P = ord vars in P

Corollary 13 (Idempotency of ordering).

- If ord vars in $N = \vec{\alpha}$ then ord $\vec{\alpha}$ in $N = \vec{\alpha}$,
- + If ord $vars in P = \vec{\alpha}$ then ord $\vec{\alpha}$ in $P = \vec{\alpha}$:

Lemma 37 (*Distributivity of renaming over variable ordering*). Suppose that μ is a bijection between two sets of variables $\mu : A \leftrightarrow B$.

- If μ is collision-free on vars and fv N then $[\mu](\text{ord } vars \text{ in } N) = \text{ord } ([\mu] vars) \text{ in } [\mu]N$
- + If μ is collision-free on vars and fv P then $[\mu]$ (ord vars in P) = ord $([\mu] vars)$ in $[\mu] P$

Lemma 38 (Ordering is not affected by independent substitutions). Suppose that $\Theta_2 \vdash \sigma : \Theta_1$, i.e. σ maps variables from Θ_1 into types taking free variables from Θ_2 , and *vars* is a set of variables disjoint with both Θ_1 and Θ_2 , N and P are types. Then

- ord vars in $[\sigma]N = \text{ord } vars \text{ in } N$
- + ord vars in $[\sigma]P = \text{ord } vars \text{ in } P$

Lemma 39 (*Completeness of variable ordering*). Variable ordering is invariant under equivalence. For arbitrary *vars*,

- If $N \simeq^D M$ then ord vars in N = ord vars in M (as lists)
- + If $P \simeq^D Q$ then ord vars in P = ord vars in Q (as lists)
- 2.1.6 Normaliztaion.

Observation 3 (*Normalization is deterministic*). If nf(N) = M and nf(N) = M' then M = M'. If nf(P) = Q and nf(P) = Q' then Q = Q'. This way, we can use normalization as a function.

Lemma 40. Free variables are not changed by the normalization

$$- fv N = fv nf (N)$$

$$+ fv P = fv nf (P)$$

Lemma 41 (Soundness of normalization).

$$- N \simeq^D \operatorname{nf}(N)$$
$$+ P \simeq^D \operatorname{nf}(P)$$

Corollary 14 (Normalization preserves well-formedness).

$$+\Theta \vdash P \iff \Theta \vdash \mathsf{nf}(P),$$
 $-\Theta \vdash N \iff \Theta \vdash \mathsf{nf}(N)$

Corollary 15 (Normalization preserves well-formedness of substitution).

$$\Theta_2 \vdash \sigma : \Theta_1 \iff \Theta_2 \vdash \mathsf{nf}(\sigma) : \Theta_1$$

Lemma 42 (*Normalization preserves substitution signature*). Suppose that σ is a substitution, Θ_1 and Θ_2 are contexts. Then $\Theta_2 \vdash \sigma : \Theta_1$ implies $\Theta_2 \vdash \mathsf{nf}(\sigma) : \Theta_1$.

Corollary 16 (*Normalization is sound w.r.t. subtyping-induced equivalence*).

```
+ if \Theta \vdash P then \Theta \vdash P \simeq^{\leqslant} \mathsf{nf}(P),

- if \Theta \vdash N then \Theta \vdash N \simeq^{\leqslant} \mathsf{nf}(N).
```

Corollary 17 (*Normalization preserves subtyping*). Assuming all the types are well-formed in context Θ .

```
+\Theta \vdash P \geqslant Q \iff \Theta \vdash \mathsf{nf}(P) \geqslant \mathsf{nf}(Q),

-\Theta \vdash N \leqslant M \iff \Theta \vdash \mathsf{nf}(N) \leqslant \mathsf{nf}(M).
```

Corollary 18 (*Normalization preserves ordering*). For any vars,

```
- ord varsin nf (N) = ord varsin M
+ ord varsin nf (P) = ord varsin O
```

Lemma 43 (*Distributivity of normalization over substitution*). Normalization of a term distributes over substitution. Suppose that σ is a substitution, N and P are types. Then

-
$$\inf([\sigma]N) = [\inf(\sigma)]\inf(N)$$

+ $\inf([\sigma]P) = [\inf(\sigma)]\inf(P)$

where $nf(\sigma)$ means pointwise normalization: $[nf(\sigma)]\alpha^- = nf([\sigma]\alpha^-)$.

Corollary 19 (*Commutativity of normalization and renaming*). Normalization of a term commutes with renaming. Suppose that μ is a bijection between two sets of variables $\mu : A \leftrightarrow B$. Then

$$- \ \mathsf{nf} \left([\mu] \textcolor{red}{N} \right) = [\mu] \mathsf{nf} \left(\textcolor{red}{N} \right)$$

+
$$nf([\mu]P) = [\mu]nf(P)$$

Lemma 44 (*Completeness of Normalization w.r.t. Declarative Equivalence*). Normalization returns the same representative for equivalent types.

- If $N \simeq^D M$ then nf(N) = nf(M),
- + if $P \simeq^D Q$ then nf (P) = nf (Q).

Lemma 45 (Algorithmization of Declarative Equivalence). Declarative equivalence is the equality of normal forms.

$$+ P \simeq^D O \iff \mathsf{nf}(P) = \mathsf{nf}(O),$$

$$-N \simeq^D M \iff \mathsf{nf}(N) = \mathsf{nf}(M).$$

Corollary 20 (Completeness of Normalization w.r.t. Subtyping-Induced Equivalence). Assuming all the types below are well-formed in Θ :

- + if $\Theta \vdash P \cong^{\leq} O$ then $\inf (P) = \inf (O)$,
- $\text{ if } \Theta \vdash N \simeq^{\leq} M \text{ then nf } (N) = \text{nf } (M).$

Lemma 46 (*Idempotence of normalization*). Normalization is idempotent

- $\inf(\inf(N)) = \inf(N)$
- + nf(nf(P)) = nf(P)

Lemma 47. The result of a substitution is normalized if and only if the initial type and the substitution are normalized.

Suppose that σ is a substitution $\Theta_2 \vdash \sigma : \Theta_1$, P is a positive type $(\Theta_1 \vdash P)$, N is a negative type $(\Theta_1 \vdash N)$. Then

$$+ \ [\sigma]_{P}^{P} \text{ is normal } \Longleftrightarrow \begin{cases} \sigma|_{\mathsf{fv}(P)} & \text{is normal} \\ P & \text{is normal} \end{cases}$$

$$- \ [\sigma] \textit{N} \text{is normal} \iff \begin{cases} \sigma|_{\mathsf{fv}\,(N)} & \text{is normal} \\ N & \text{is normal} \end{cases}$$

Lemma 48 (*Algorithmization of subtyping-induced equivalence*). Mutual subtyping is the equality of normal forms. Assuming all the types below are well-formed in Θ :

, Vol. 1, No. 1, Article . Publication date: July 2024.

```
2059 + \Theta \vdash P \simeq^{\leqslant} Q \iff \inf(P) = \inf(Q),

2060 - \Theta \vdash N \simeq^{\leqslant} M \iff \inf(N) = \inf(M).
```

Corollary 21 (Substitution preserves declarative equivalence). Suppose that σ is a substitution. Then

- + $P \simeq^D Q$ implies $[\sigma]P \simeq^D [\sigma]Q$
- $-N \simeq^D M$ implies $[\sigma]N \simeq^D [\sigma]M$

2.2 Declarative Typing

Lemma 49. If Θ ; $\Gamma \vdash N_1 \bullet \overrightarrow{v} \Longrightarrow M$ and $\Theta \vdash N_1 \simeq^{\leqslant} N_2$ then Θ ; $\Gamma \vdash N_2 \bullet \overrightarrow{v} \Longrightarrow M$.

Lemma 50 (Declarative typing is preserved under context equivalence). Assuming $\Theta \vdash \Gamma_1$, $\Theta \vdash \Gamma_2$, and $\Theta \vdash \Gamma_1 \simeq^{\leqslant} \Gamma_2$:

- + for any tree T_1 inferring Θ ; $\Gamma_1 \vdash \nu : P$, there exists a tree T_2 inferring Θ ; $\Gamma_2 \vdash \nu : P$.
- for any tree T_1 inferring Θ ; $\Gamma_1 \vdash c : N$, there exists a tree T_2 inferring Θ ; $\Gamma_2 \vdash c : N$.
- for any tree T_1 inferring Θ ; $\Gamma_1 \vdash N \bullet \overrightarrow{v} \implies M$, there exists a tree T_2 inferring Θ ; $\Gamma_2 \vdash N \bullet \overrightarrow{v} \implies M$.

2.3 Relation to System F

Lemma 51 (Subtyping elaboration term can be removed).

- For any Θ , N, and M, Θ ⊢ $N \le M$ holds if and only if there exists t such that Θ ⊢ $N \le M \leadsto t$;
- + For any Θ , P, and Q, $\Theta \vdash P \geqslant Q$ holds if and only if there exists t such that $\Theta \vdash P \geqslant Q \leadsto t$.

Observation 4 (*Type depolarization distributes over substitution*).

- $+ |[\sigma]N| = [|\sigma|]|N|,$
- $-|[\sigma]P|=[|\sigma|]|P|.$

Lemma 52 (Soundness of Subtyping Elaboration).

- If $\Theta \vdash N \leq M \rightsquigarrow t$ then $|\Theta|$; $\cdot \vdash t : |N| \rightarrow |M|$;
- + if $\Theta \vdash P \geqslant O \rightsquigarrow t$ then $|\Theta| : \vdash t : |O| \rightarrow |P|$.

Lemma 53 (Soundness of F_{\exists}^{\pm} w.r.t. System F). A judgment inferred by F_{\exists}^{\pm} is derivable in System F.

+ If Θ ; $\Gamma \vdash v : P \rightarrow t$ then $|\Theta|$; $|\Gamma| \vdash t : |P|$;

```
2108 - if \Theta; \Gamma \vdash c : N \leadsto t then |\Theta|; |\Gamma| \vdash t : |N|;
```

- if Θ ; $\Gamma \vdash N \bullet \overrightarrow{v} \implies M \leadsto e$; \overrightarrow{t} then $|\Theta|$; $|\Gamma|, x : |N| \vdash e(x\overrightarrow{t}) : |M|$.
- **Lemma 54** (*Polarization commutes with substitution*). $|[A/\alpha]T| = [|A|/\alpha^+]|T|$
- **Observation 5.** For any Θ , Γ , t, and T, there exists c such that Θ ; $\Gamma \vdash t : T \rightsquigarrow^{\pm} c$ if and only if Θ ; $\Gamma \vdash t : T$.
- **Lemma 55** (Type polarization agrees with well-formedness). If $\Theta \vdash T$ then $|\Theta| \vdash |T|$.
- **Lemma 56** (*Polarization preserves typing*). If Θ ; $\Gamma \vdash t : T \leadsto^{\pm} c$ then $|\Theta|$; $|\Gamma| \vdash c : \uparrow |T|$.

2.4 Theorem Statements: Algorithmic

2.4.1 Algorithmic Type Well-formedness.

Lemma 57. If
$$\Theta : \Gamma \vdash N_1 \bullet \overrightarrow{v} \implies M$$
 and $\Theta \vdash N_1 \simeq^{\leq} N_2$ then $\Theta : \Gamma \vdash N_2 \bullet \overrightarrow{v} \implies M$.

Lemma 58 (Soundness of algorithmic type well-formedness).

+ if
$$\Theta$$
; $\widehat{\Theta} \vdash P$ then fv $(P) \subseteq \Theta$ and fav $(P) \subseteq \widehat{\Theta}$;

$$- \text{ if } \Theta ; \widehat{\Theta} \vdash N \text{ then fv } (N) \subseteq \Theta \text{ and fav} (N) \subseteq \widehat{\Theta}.$$

Lemma 59 (*Completeness of algorithmic type well-formedness*). In the well-formedness judgment, only used variables matter:

- + if $\Theta_1 \cap \text{fv } P = \Theta_2 \cap \text{fv } P$ and $\widehat{\Theta}_1 \cap \text{fav}(P) = \widehat{\Theta}_2 \cap \text{fav}(P)$ then $\Theta_1; \widehat{\Theta}_1 \vdash P \iff \Theta_2; \widehat{\Theta}_2 \vdash P$, and
- $\text{ if } \Theta_1 \cap \text{fv } N = \Theta_2 \cap \text{fv } N \text{ and } \widehat{\Theta}_1 \cap \text{fav}(N) = \widehat{\Theta}_2 \cap \text{fav}(N) \text{ then } \Theta_1; \widehat{\Theta}_1 \vdash N \iff \Theta_2; \widehat{\Theta}_2 \vdash N.$

Lemma 60 (Variable algorithmization agrees with well-formedness).

$$+\Theta, \overrightarrow{\alpha} \vdash P \text{ implies } \Theta; \overrightarrow{\widehat{\alpha}} \vdash [\overrightarrow{\widehat{\alpha}} / \overrightarrow{\alpha}]P;$$

$$-\Theta, \overrightarrow{\alpha} + N \text{ implies } \Theta; \overrightarrow{\widehat{\alpha}} + [\overrightarrow{\widehat{\alpha}} / \overrightarrow{\alpha}] N.$$

Lemma 61 (Variable de-algorithmization agrees with well-formedness).

+
$$\Theta$$
; $\overrightarrow{\widehat{\alpha}} \vdash P$ implies Θ , $\overrightarrow{\alpha} \vdash [\overrightarrow{\alpha} / \overrightarrow{\widehat{\alpha}}]P$;

$$-\Theta$$
; $\overrightarrow{\widehat{\alpha}} + N$ implies Θ , $\overrightarrow{\alpha} + [\overrightarrow{\alpha}^2/\overrightarrow{\widehat{\alpha}}]N$.

Corollary 22 (Well-formedness Algorithmic Context Weakening). Suppose that $\Theta_1 \subseteq \Theta_2$, and $\widehat{\Theta}_1 \subseteq \widehat{\Theta}_2$. Then

+ if
$$\Theta_1$$
; $\widehat{\Theta}_1 \vdash \mathbf{P}$ implies Θ_2 ; $\widehat{\Theta}_2 \vdash \mathbf{P}$,

, Vol. 1, No. 1, Article . Publication date: July 2024.

```
2157 - if \Theta_1; \widehat{\Theta}_1 \vdash N implies \Theta_2; \widehat{\Theta}_2 \vdash N.
```

2.4.2 Algorithmic Substitution.

 Lemma 62 (*Determinacy of typing algorithm*). Suppose that $\Theta \vdash \Gamma$ and $\Theta \vdash^{\supseteq} \Xi$. Then

- + If Θ ; $\Gamma \models \nu$: P and Θ ; $\Gamma \models \nu$: P' then P = P'.
- If Θ ; $\Gamma \models c : N$ and Θ ; $\Gamma \models c : N'$ then N = N'.
 - If $\Theta : \Gamma : \Xi \models N \bullet \overrightarrow{v} \implies M \dashv \Xi' : C \text{ and } \Theta : \Gamma : \Xi \models N \bullet \overrightarrow{v} \implies M' \dashv \Xi' : C' \text{ then } M = M', \Xi = \Xi', \text{ and } C = C'.$

Lemma 63 (Algorithmic Substitution Strengthening). Restricting the substitution to the algorithmic variables of the substitution subject does not affect the result. Suppose that $\widehat{\sigma}$ is an algorithmic substitution, P and N are algorithmic types. Then

- + $[\widehat{\sigma}]P = [\widehat{\sigma}|_{fav(P)}]P$,
- $[\widehat{\sigma}] N = [\widehat{\sigma}|_{fav(N)}] N$

Lemma 64 (Substitutions equal on the algorithmic variables). Suppose that $\widehat{\sigma}_1$ and $\widehat{\sigma}_2$ are normalized substitutions of signature $\Xi \vdash \widehat{\sigma}_i : \widehat{\Theta}$. Then

- + for a normalized type Θ ; $\widehat{\Theta} \vdash P$, if $[\widehat{\sigma}_1]P = [\widehat{\sigma}_2]P$ then $\widehat{\sigma}_1|_{(\mathsf{fav}(P))} = \widehat{\sigma}_2|_{(\mathsf{fav}(P))}$;
- for a normalized type Θ ; $\widehat{\Theta} \vdash N$, if $[\widehat{\sigma}_1]N = [\widehat{\sigma}_2]N$ then $\widehat{\sigma}_1|_{(\mathsf{fav}(N))} = \widehat{\sigma}_2|_{(\mathsf{fav}(N))}$.

Corollary 23 (Substitutions equivalent on the algorithmic variables). Suppose that $\widehat{\sigma}_1$ and $\widehat{\sigma}_2$ are substitutions of signature $\Xi \vdash \widehat{\sigma}_i : \widehat{\Theta}$ where $\Theta \vdash^{\supseteq} \Xi$. Then

- + for a type Θ ; $\widehat{\Theta} \vdash P$, if $\Theta \vdash [\widehat{\sigma}_1]P \simeq^{\leqslant} [\widehat{\sigma}_2]P$ then $\Xi \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2$: fav(P);
- for a type Θ ; $\widehat{\Theta} \vdash N$, if $\Theta \vdash [\widehat{\sigma}_1] N \simeq^{\leqslant} [\widehat{\sigma}_2] N$ then $\Xi \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2$: fav(N).
- 2.4.3 Algorithmic Normalization.

Lemma 65 (*Determinacy of typing algorithm*). Suppose that $\Theta \vdash \Gamma$ and $\Theta \vdash^{\supseteq} \Xi$. Then

- + If Θ ; $\Gamma \models \nu$: P and Θ ; $\Gamma \models \nu$: P' then P = P'.
- If Θ ; $\Gamma \models c$: N and Θ ; $\Gamma \models c$: N' then N = N'.
- If Θ ; Γ ; $\Xi \models N \bullet \overrightarrow{v} \implies M \dashv \Xi'$; C and Θ ; Γ ; $\Xi \models N \bullet \overrightarrow{v} \implies M' \dashv \Xi'$; C' then M = M', $\Xi = \Xi'$, and C = C'.

Lemma 66 (Algorithmic variables are not changed by the normalization).

 $- fav(\underline{N}) \equiv fav(nf(\underline{N}))$

```
+ fav(\underline{P}) \equiv fav(nf(\underline{P}))
```

Lemma 67 (Soundness of normalization of algorithmic types).

 $- N \simeq^D \operatorname{nf}(N)$

+
$$\mathbf{P} \simeq^D \operatorname{nf}(\mathbf{P})$$

2.4.4 Algorithmic Equivalence.

Lemma 68 (Algorithmic type well-formedness is invariant under equivalence). Mutual subtyping implies declarative equivalence.

- + if $\underline{P} \simeq^D \underline{Q}$ then $\Theta ; \widehat{\Theta} \vdash \underline{P} \iff \Theta ; \widehat{\Theta} \vdash \underline{Q}$,
- if $N \simeq^D M$ then $\Theta : \widehat{\Theta} \vdash N \iff \Theta : \widehat{\Theta} \vdash M$

Corollary 24 (Normalization preserves well-formedness of algorithmic types). $+ \Theta; \widehat{\Theta} \vdash P \iff \Theta; \widehat{\Theta} \vdash \Gamma$

$$-\Theta;\widehat{\Theta} \vdash N \iff \Theta;\widehat{\Theta} \vdash \mathsf{nf}(N)$$

Corollary 25 (Normalization preserves the signature of the algorithmic substitution). $\Xi \vdash \widehat{\sigma} : \widehat{\Theta} \iff \Xi \vdash \mathsf{nf}(\widehat{\sigma}) : \widehat{\Theta}, \Theta \vdash \widehat{\sigma} : \widehat{\Theta} \iff \Theta \vdash \mathsf{nf}(\widehat{\sigma}) : \widehat{\Theta}.$

Corollary 26 (Algorithmic substitution equivalence becomes equality after normalization). Suppose that $\Xi \vdash \widehat{\sigma}_1 : \widehat{\Theta}'$ and $\Xi \vdash \widehat{\sigma}_2 : \widehat{\Theta}'$ are algorithmic substitutions and $\widehat{\Theta} \subseteq \widehat{\Theta}'$. Then $\Xi \vdash \widehat{\sigma}_1 \simeq^{\varsigma} \widehat{\sigma}_2 : \widehat{\Theta} \iff \inf(\widehat{\sigma}_1)|_{\widehat{\Theta}} = \inf(\widehat{\sigma}_2)|_{\widehat{\Theta}}$.

2.4.5 Unification Constraint Merge.

Observation 6 (*Unification Constraint Merge Determinism*). Suppose that $\Xi \vdash UC_1$ and $\Xi \vdash UC_2$ If $\Xi \vdash UC_1 \& UC_2 = UC$ and $\Xi \vdash UC_1 \& UC_2 = UC'$ are defined then UC = UC'.

Lemma 69 (Soundness of Unification Constraint Merge). Suppose that $\Xi \vdash UC_1$ and $\Xi \vdash UC_2$ are normalized unification constraints. If $\Xi \vdash UC_1 \& UC_2 = UC$ is defined then $UC = UC_1 \cup UC_2$.

Corollary 27. Suppose that $\Xi \vdash UC_1$ and $\Xi \vdash UC_2$ are normalized unification constraints. If $\Xi \vdash UC_1 \& UC_2 = UC$ is defined then

- (1) $\Xi \vdash UC$ is normalized unification constraint,
- (2) for any substitution $\Xi \vdash \widehat{\sigma} : \text{dom}(UC), \Xi \vdash \widehat{\sigma} : UC \text{ implies } \Xi \vdash \widehat{\sigma} : UC_1 \text{ and } \Xi \vdash \widehat{\sigma} : UC_2.$

Lemma 70 (Completeness of Unification Constraint Entry Merge). For a fixed context Θ , suppose that $\Theta \vdash ue_1$ and $\Theta \vdash ue_2$ are matching constraint entries.

+ for a type P such that $\Theta \vdash P : ue_1$ and $\Theta \vdash P : ue_2$, $\Theta \vdash ue_1 \& ue_2 = ue$ is defined and $\Theta \vdash P : ue$.

- for a type N such that $\Theta \vdash N : ue_1$ and $\Theta \vdash N : ue_2$, $\Theta \vdash ue_1 \& ue_2 = ue$ is defined and $\Theta \vdash N : ue$.

Lemma 71 (Completeness of Unification Constraint Merge). Suppose that $\Xi \vdash UC_1$ and $\Xi \vdash UC_2$. Then for any $\widehat{\Theta} \supseteq \text{dom}(UC_1) \cup \text{dom}(UC_2)$ and substitution $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$ such that $\Xi \vdash \widehat{\sigma} : UC_1$ and $\Xi \vdash \widehat{\sigma} : UC_2$,

- (1) $\Xi \vdash UC_1 \& UC_2 = UC$ is defined and
- (2) $\Xi \vdash \widehat{\sigma} : UC$.

2.4.6 Unification.

 Observation 7 (Unification Determinism).

- + If Θ ; $\Xi \models \mathbb{P} \stackrel{u}{\simeq} Q = UC$ and Θ ; $\Xi \models \mathbb{P} \stackrel{u}{\simeq} Q = UC'$ then UC = UC'.
- If Θ ; $\Xi \models \mathbb{N} \stackrel{u}{\simeq} M = UC$ and Θ ; $\Xi \models \mathbb{N} \stackrel{u}{\simeq} M = UC'$ then UC = UC'.

Lemma 72 (Soundness of Unification).

- + For normalized \underline{P} and \underline{Q} such that Θ ; dom $(\Xi) \vdash \underline{P}$ and $\Theta \vdash \underline{Q}$, if Θ ; $\Xi \vdash \underline{P} \stackrel{u}{\simeq} \underline{Q} = UC$ then $\Xi \vdash UC$: fav (\underline{P}) and for any normalized $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : UC$, $[\widehat{\sigma}]\underline{P} = \underline{Q}$.
- For normalized N and M such that Θ ; dom $(\Xi) \vdash N$ and $\Theta \vdash M$, if Θ ; $\Xi \models N \stackrel{u}{\simeq} M = UC$ then $\Xi \vdash UC : fav(N)$ and for any normalized $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : UC$, $[\widehat{\sigma}] N = M$.

Lemma 73 (Completeness of Unification).

- + For normalized \underline{P} and \underline{Q} such that Θ ; dom $(\Xi) \vdash \underline{P}$ and $\Theta \vdash \underline{Q}$, suppose that there exists $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{P})$ such that $[\widehat{\sigma}]\underline{P} = \underline{Q}$, then Θ ; $\Xi \vdash \underline{P} \stackrel{u}{\simeq} \underline{Q} = \underline{UC}$ for some \underline{UC} .
- For normalized N and M such that Θ ; dom $(\Xi) \vdash N$ and $\Theta \vdash M$, suppose that there exists $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(N)$ such that $[\widehat{\sigma}] N = M$, then $\Theta : \Xi \vdash N \stackrel{u}{\simeq} M \dashv UC$ for some UC.

2.4.7 Anti-unification.

Observation 8 (Determinism of Anti-unification Algorithm).

- + If $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ and $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}', Q', \widehat{\tau}_1', \widehat{\tau}_2')$, then $\widehat{\Theta} = \widehat{\Theta}', Q = Q', \widehat{\tau}_1 = \widehat{\tau}_1'$, and $\widehat{\tau}_2 = \widehat{\tau}_2'$.
- $\text{ If } \Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2) \text{ and } \Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}', M', \widehat{\tau}_1', \widehat{\tau}_2'), \text{ then } \widehat{\Theta} = \widehat{\Theta}', M = M', \widehat{\tau}_1 = \widehat{\tau}_1', \text{ and } \widehat{\tau}_2 = \widehat{\tau}_2'.$

Observation 9 (*Uniqueness of Anti-unification Variable Names*). Names of the anti-unification variables are uniquely defined by the types they are mapped to by the resulting substitutions.

- + Assuming P_1 and P_2 are normalized, if $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \mathbb{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ then for any $\widehat{\beta}^- \in \widehat{\Theta}$, $\widehat{\beta}^- = \widehat{\alpha}^-_{\{[\widehat{\tau}_1]\widehat{\beta}^-, [\widehat{\tau}_2]\widehat{\beta}^-\}}$
- Assuming N_1 and N_2 are normalized, if $\Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ then for any $\widehat{\beta}^- \in \widehat{\Theta}$, $\widehat{\beta}^- = \widehat{\alpha}^-_{\{[\widehat{\tau}_1]\widehat{\beta}^-, [\widehat{\tau}_2]\widehat{\beta}^-\}}$

Lemma 74 (Soundness of Anti-Unification).

- + Assuming P_1 and P_2 are normalized, if $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ then
 - (1) Θ ; $\widehat{\Theta} \vdash \mathcal{O}$,

- (2) Θ ; $\cdot \vdash \widehat{\tau}_i : \widehat{\Theta}$ for $i \in \{1, 2\}$ are anti-unification substitutions, and
- (3) $\left[\widehat{\tau}_{i}\right]Q = P_{i} \text{ for } i \in \{1, 2\}.$
- Assuming N_1 and N_2 are normalized, if $\Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ then
 - (1) Θ ; $\widehat{\Theta} \vdash M$,
 - (2) Θ ; $\cdot \vdash \widehat{\tau}_i : \widehat{\Theta}$ for $i \in \{1, 2\}$ are anti-unification substitutions, and
 - (3) $[\widehat{\tau}_i] M = N_i \text{ for } i \in \{1, 2\}.$

Lemma 75 (Completeness of Anti-Unification).

- + Assume that P_1 and P_2 are normalized, and there exists $(\widehat{\Theta}', \underline{Q}', \widehat{\tau}'_1, \widehat{\tau}'_2)$ such that
 - (1) Θ ; $\widehat{\Theta}' \vdash \underline{Q}'$,
 - (2) Θ ; $\cdot \vdash \widehat{\tau}'_i : \widehat{\Theta}'$ for $i \in \{1, 2\}$ are anti-unification substitutions, and
 - (3) $[\hat{\tau}'_i] Q' = P_i \text{ for } i \in \{1, 2\}.$

Then the anti-unification algorithm terminates, that is there exists $(\widehat{\Theta}, \underline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ such that $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \underline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$

- Assume that N_1 and N_2 are normalized, and there exists $(\widehat{\Theta}', \underline{M}', \widehat{\tau}'_1, \widehat{\tau}'_2)$ such that
 - (1) Θ ; $\widehat{\Theta}' \vdash \underline{M}'$,
 - (2) Θ ; $\cdot \vdash \widehat{\tau}_i' : \widehat{\Theta}'$ for $i \in \{1, 2\}$, are anti-unification substitutions, and
 - (3) $[\hat{\tau}'_i]M' = N_i \text{ for } i \in \{1, 2\}.$

Then the anti-unification algorithm succeeds, that is there exists $(\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ such that $\Theta \models N_1 \stackrel{a}{\simeq} N_2 \ni (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$.

Lemma 76 (Initiality of Anti-Unification).

- + Assume that P_1 and P_2 are normalized, and $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \overline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$, then $(\widehat{\Theta}, \overline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ is more specific than any other sound anti-unifier $(\widehat{\Theta}', \overline{Q}', \widehat{\tau}'_1, \widehat{\tau}'_2)$, i.e. if
 - (1) Θ ; $\widehat{\Theta}' \vdash O'$,

- (2) Θ ; $\cdot \vdash \widehat{\tau}'_i : \widehat{\Theta}'$ for $i \in \{1, 2\}$, and
- (3) $[\hat{\tau}'_i]Q' = P_i \text{ for } i \in \{1, 2\}$

then there exists $\widehat{\rho}$ such that Θ ; $\widehat{\Theta} \vdash \widehat{\rho} : (\widehat{\Theta}'|_{\mathsf{fav}(\underline{Q}')})$ and $[\widehat{\rho}] \underline{Q}' = \underline{Q}$. Moreover, $[\widehat{\rho}] \widehat{\beta}^-$ can be uniquely determined by $[\widehat{\tau}'_1] \widehat{\beta}^-$, $[\widehat{\tau}'_2] \widehat{\beta}^-$, and Θ .

- Assume that N_1 and N_2 are normalized, and $\Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$, then $(\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ is more specific than any other sound anti-unifier $(\widehat{\Theta}', M', \widehat{\tau}'_1, \widehat{\tau}'_2)$, i.e. if
 - (1) Θ ; $\widehat{\Theta}' \vdash M'$.
 - (2) Θ ; $\vdash \widehat{\tau}'_i : \widehat{\Theta}'$ for $i \in \{1, 2\}$, and
 - (3) $[\hat{\tau}'_i]M' = N_i \text{ for } i \in \{1, 2\}$

then there exists $\widehat{\rho}$ such that Θ ; $\widehat{\Theta} \vdash \widehat{\rho} : (\widehat{\Theta}'|_{\mathsf{fav}(M')})$ and $[\widehat{\rho}]M' = M$. Moreover, $[\widehat{\rho}]\widehat{\beta}^-$ can be uniquely determined by $[\widehat{\tau}'_1]\widehat{\beta}^-$, $[\widehat{\tau}'_2]\widehat{\beta}^-$, and Θ .

2.4.8 Upper Bounds.

Observation 10 (*Determinism of Least Upper Bound algorithm*). For types $\Theta \vdash P_1$, and $\Theta \vdash P_2$, if $\Theta \models P_1 \lor P_2 = Q$ and $\Theta \models P_1 \lor P_2 = Q'$ then Q = Q'.

Lemma 77 (*Characterization of the Supertypes*). Let us define the set of upper bounds of a positive type UB(P) in the following way:

Then $UB(\Theta \vdash P) \equiv \{Q \mid \Theta \vdash Q \geqslant P\}.$

Lemma 78 (*Characterization of the Normalized Supertypes*). For a normalized positive type P = nf(P), let us define the set of normalized upper bounds in the following way:

Then $NFUB(\Theta \vdash P) \equiv \{ nf(Q) \mid \Theta \vdash Q \geqslant P \}.$

Lemma 79. Upper bounds of a type do not depend on the context as soon as the type is well-formed in it.

```
If \Theta_1 \vdash P and \Theta_2 \vdash P then \mathsf{UB}(\Theta_1 \vdash P) = \mathsf{UB}(\Theta_2 \vdash P) and \mathsf{NFUB}(\Theta_1 \vdash P) = \mathsf{NFUB}(\Theta_2 \vdash P)
```

Lemma 80 (Soundness of the Least Upper Bound). For types $\Theta \vdash P_1$, and $\Theta \vdash P_2$, if $\Theta \models P_1 \lor P_2 = Q$ then

- (i) $\Theta \vdash Q$
- (ii) $\Theta \vdash Q \geqslant P_1$ and $\Theta \vdash Q \geqslant P_2$

Lemma 81 (Completeness and Initiality of the Least Upper Bound). For types $\Theta \vdash P_1$, $\Theta \vdash P_2$, and $\Theta \vdash Q$ such that $\Theta \vdash Q \geqslant P_1$ and $\Theta \vdash Q \geqslant P_2$, there exists Q' s.t. $\Theta \models P_1 \lor P_2 = Q'$ and $\Theta \vdash Q \geqslant Q'$.

2.4.9 Upgrade.

Observation 11 (*Upgrade determinism*). Assuming P is well-formed in $\Theta \subseteq \Theta_0$, if upgrade $\Theta \vdash P$ to $\Theta_0 = Q$ and upgrade $\Theta \vdash P$ to $\Theta_0 = Q'$ are defined then Q = Q'.

Lemma 82 (Soundness of Upgrade). Assuming P is well-formed in $\Theta = \Theta_0$, $\overrightarrow{\alpha^{\pm}}$, if upgrade $\Theta \vdash P$ to $\Theta_0 = Q$ then

- (1) $\Theta_0 \vdash Q$
- (2) $\Theta \vdash Q \geqslant P$

Lemma 83 (Completeness and Initiality of Upgrade). The upgrade returns the least Θ -supertype of P well-formed in Θ_0 . Assuming P is well-formed in $\Theta = \Theta_0$, α^{\pm} , For any Q' such that

- (1) $\Theta_0 \vdash Q'$ and
- (2) $\Theta \vdash Q' \geqslant P$,

```
the result of the upgrade algorithm Q exists (upgrade \Theta \vdash P to \Theta_0 = Q) and satisfies \Theta_0 \vdash Q' \geqslant Q.

```

(2) For any $\Theta \vdash P$, $\Theta \vdash P$: e implies $\Theta \vdash P$: e_1 and $\Theta \vdash P$: e_2

2497

Lemma 89 (Soundness of Constraint Merge). Suppose that $\Xi \vdash C_1 : \widehat{\Theta}_1$ and $\Xi \vdash C_2 : \widehat{\Theta}_2$ and $\Xi \vdash C_1 \& C_2 = C$ is defined. Then

(1) $\Xi \vdash C : \widehat{\Theta}_1 \cup \widehat{\Theta}_2$,

 (2) for any substitution $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}_1 \cup \widehat{\Theta}_2$, $\Xi \vdash \widehat{\sigma} : C$ implies $\Xi \vdash \widehat{\sigma} : C_1$ and $\Xi \vdash \widehat{\sigma} : C_2$.

Lemma 90 (Completeness of Constraint Entry Merge). For a fixed context Θ , suppose that $\Theta \vdash e_1$ and $\Theta \vdash e_2$ are matching constraint entries.

- for a type P such that $\Theta \vdash P : e_1$ and $\Theta \vdash P : e_2$, $\Theta \vdash e_1 \& e_2 = e$ is defined and $\Theta \vdash P : e$.
- for a type N such that $\Theta \vdash N : e_1$ and $\Theta \vdash N : e_2$, $\Theta \vdash e_1 \& e_2 = e$ is defined and $\Theta \vdash N : e$.

Lemma 91 (Completeness of Constraint Merge). Suppose that $\Xi \vdash C_1 : \widehat{\Theta}_1$ and $\Xi \vdash C_2 : \widehat{\Theta}_2$. If there exists a substitution $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}_1 \cup \widehat{\Theta}_2$ such that $\Xi \vdash \widehat{\sigma} : C_1$ and $\Xi \vdash \widehat{\sigma} : C_2$ then $\Xi \vdash C_1 \& C_2 = C$ is defined.

- 2.4.13 Negative Subtyping.
- **Observation 16** (Negative Algorithmic Subtyping is Deterministic). For fixed Θ , Ξ , M, and N, if Θ ; $\Xi \models N \leq M \dashv C$ and Θ ; $\Xi \models N \leq M \dashv C'$ then C = C'.
- **Lemma 92** (Soundness of Negative Subtyping). If $\Theta \vdash^{\supseteq} \Xi$, $\Theta \vdash M$, Θ ; dom $(\Xi) \vdash N$ and Θ ; $\Xi \vdash$ $N \leq M \exists C$, then $\Xi \vdash C : \mathsf{fav}(N)$ and for any normalized $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : C$, $\Theta \vdash [\widehat{\sigma}] N \leq M$.
 - **Lemma 93** (Completeness of the Negative Subtyping). Suppose that $\Theta \vdash^{\supseteq} \Xi, \Theta \vdash M, \Theta; dom(\Xi) \vdash N$, and N does not contain negative unification variables $(\widehat{\alpha}^{-} \notin fav(N))$. Then for any $\Xi \vdash \widehat{\sigma} : fav(N)$ such that $\Theta \vdash [\widehat{\sigma}] N \leq M$, there exists Θ ; $\Xi \vdash N \leq M \dashv C$ and moreover, $\Xi \vdash \widehat{\sigma} : C$.
 - 2.4.14 Singularity and Minimal Instantiation.

Lemma 94 (Soundness of Minimal Instantiation). Suppose that $\Theta \vdash^{\supseteq} \Xi, \Xi \vdash C$, and Θ ; dom $(\Xi) \vdash P$. If P is C-minimized by $\widehat{\sigma}$ then

- $\Xi \vdash \widehat{\sigma} : fav(\underline{P})$,
- $\Xi \vdash \widehat{\sigma} : C$.
- $\widehat{\sigma}$ is normalized, and
- for any other $\Xi \vdash \widehat{\sigma}' : \mathsf{fav}(\underline{P})$ respecting C (i.e., $\Xi \vdash \widehat{\sigma}' : C$), we have $\Theta \vdash [\widehat{\sigma}']\underline{P} \ge [\widehat{\sigma}]\underline{P}$.

Lemma 95 (Completeness of Minimal Instantiation). Suppose that $\Theta \vdash^{\supseteq} \Xi, \Xi \vdash C, \Theta$; dom $(\Xi) \vdash P$, and there exists $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(P)$ respecting $C (\Xi \vdash \widehat{\sigma} : C)$ such that for any other $\Xi \vdash \widehat{\sigma}' : \mathsf{fav}(P)$ respecting $C (\Xi \vdash \widehat{\sigma}' : C)$, we have $\Theta \vdash [\widehat{\sigma}']P \geqslant [\widehat{\sigma}]P$. Then P is C-minimized by $\mathsf{nf}(\widehat{\sigma})$.

Observation 17 (*Minimal Instantiation is Deterministic*). Suppose that $\Theta \vdash^{\supseteq} \Xi, \Xi \vdash C, \Theta; dom(\Xi) \vdash P$. Then P is C-minimized by $\widehat{\sigma}$ and P is C-minimized by $\widehat{\sigma}'$ implies $\widehat{\sigma} = \widehat{\sigma}'$.

Lemma 96 (Soundness of Entry Singularity).

, Vol. 1, No. 1, Article . Publication date: July 2024.

+ Suppose e singular with P for P well-formed in Θ . Then $\Theta \vdash P : e, P$ is normalized, and for any $\Theta \vdash P'$ such that $\Theta \vdash P' : e, \Theta \vdash P' \simeq^{\epsilon} P$;

- Suppose *e* singular with *N* for *N* well-formed in Θ. Then Θ ⊢ *N* : *e*, *N* is normalized, and for any Θ ⊢ *N'* such that Θ ⊢ *N'* : *e*, Θ ⊢ *N'* \simeq ^{\leq} *N*.

Lemma 97 (Completeness of Entry Singularity).

- Suppose that there exists N well-formed in Θ such that for any N' well-formed in Θ , $\Theta \vdash N' : e$ implies $\Theta \vdash N' \simeq^{\leq} N$. Then e singular with nf(N).
- + Suppose that there exists P well-formed in Θ such that for any P' well-formed in Θ , $\Theta \vdash P' : e$ implies $\Theta \vdash P' \simeq^{e} P$. Then e singular with nf(P).

Lemma 98 (Soundness of Singularity). Suppose $\Xi \vdash C : \widehat{\Theta}$, and C singular with $\widehat{\sigma}$. Then $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$, $\Xi \vdash \widehat{\sigma} : C$, $\widehat{\sigma}$ is normalized, and for any $\widehat{\sigma}'$ such that $\Xi \vdash \widehat{\sigma} : C$, $\Xi \vdash \widehat{\sigma}' \simeq^{\leq} \widehat{\sigma} : \widehat{\Theta}$.

Observation 18 (*Singularity is Deterministic*). For a fixed *C* such that $\Xi \vdash C : \widehat{\Theta}$, if *C* singular with $\widehat{\sigma}$ and *C* singular with $\widehat{\sigma}'$, then $\widehat{\sigma} = \widehat{\sigma}'$.

Lemma 99 (Completeness of Singularity). For a given $\Xi \vdash C$, suppose that all the substitutions satisfying C are equivalent on $\widehat{\Theta} \supseteq \text{dom}(C)$. In other words, suppose that there exists $\Xi \vdash \widehat{\sigma}_1 : \widehat{\Theta}$ such that for any $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$, $\Xi \vdash \widehat{\sigma} : C$ implies $\Xi \vdash \widehat{\sigma} \simeq^{\leqslant} \widehat{\sigma}_1 : \widehat{\Theta}$. Then

- C singular with $\widehat{\sigma}_0$ for some $\widehat{\sigma}_0$ and
- $\widehat{\Theta} = \text{dom}(C)$.

2.4.15 Correctness of the Typing Algorithm.

Lemma 100 (*Determinacy of typing algorithm*). Suppose that $\Theta \vdash \Gamma$ and $\Theta \vdash^{\supseteq} \Xi$. Then

- + If Θ ; $\Gamma \models \nu$: P and Θ ; $\Gamma \models \nu$: P' then P = P'.
- If Θ ; $\Gamma \models c$: N and Θ ; $\Gamma \models c$: N' then N = N'.
- If Θ ; Γ ; $\Xi \models \mathbb{N}$ $\overrightarrow{v} \Longrightarrow M \dashv \Xi'$; C and Θ ; Γ ; $\Xi \models \mathbb{N}$ $\overrightarrow{v} \Longrightarrow M' \dashv \Xi'$; C' then M = M', $\Xi = \Xi'$, and C = C'.

Lemma 101 (Soundness of typing). Suppose that $\Theta \vdash \Gamma$. For an inference tree T_1 ,

- + If T_1 infers Θ ; $\Gamma \models v : P$ then $\Theta \vdash P$ and Θ ; $\Gamma \vdash v : P$
- If T_1 infers Θ ; $\Gamma \models c : N$ then $\Theta \vdash N$ and Θ ; $\Gamma \vdash c : N$
- If T_1 infers Θ ; Γ ; $\Xi \models \mathbb{N} \bullet \overrightarrow{v} \implies M \ni \Xi'$; C for $\Theta \vdash^{\supseteq} \Xi$ and Θ ; dom $(\Xi) \vdash \mathbb{N}$ free from negative algorithmic variables, then
 - (1) Θ ⊢[⊇] Ξ'
 - (2) $\Xi \subseteq \Xi'$

3.1 Declarative Types

3.1.1 Type Well-Formedness.

Lemma 3 (Soundness of type well-formedness).

- + If $\Theta \vdash P$ then $f \lor (P) \subseteq \Theta$,
- if Θ \vdash *N* then fv (*N*) ⊆ Θ.

Proof. The proof is done by a simple structural induction on $\Theta \vdash P$ and mutually, $\Theta \vdash N$.

- **Case 1**. $\Theta \vdash \alpha^{\pm}$ means by inversion that $\alpha^{\pm} \in \Theta$, that is, $\alpha^{\pm} = \text{fv}(\alpha^{\pm}) \subseteq \Theta$.
- **Case 2.** $\Theta \vdash Q \to M$ means by inversion that $\Theta \vdash Q$ and $\Theta \vdash M$. Then by the induction hypothesis, $fv(Q) \subseteq \Theta$ and $fv(M) \subseteq \Theta$, and hence, $fv(Q \to M) = fv(Q) \cup fv(M) \subseteq \Theta$.
- **Case 3.** the cases when $P = \downarrow N'$ or $N = \uparrow P'$ are proven analogously.
- Case 4. $\Theta \vdash \forall \overrightarrow{\alpha^+}$. M means by inversion that $\Theta, \overrightarrow{\alpha^+} \vdash M$. Then by the induction hypothesis, $f \lor (M) \subseteq \Theta, \overrightarrow{\alpha^+}$, and hence, $f \lor (\forall \overrightarrow{\alpha^+}, M) = f \lor (M) \setminus \overrightarrow{\alpha^+} \subseteq \Theta, \overrightarrow{\alpha^+} \setminus \overrightarrow{\alpha^+} = \Theta$.
- **Case 5**. The case $P = \exists \overrightarrow{\alpha}$. *Q* is proven analogously.

Lemma 4 (*Completeness of type well-formedness*). In the well-formedness judgment, only used variables matter:

- + if $\Theta_1 \cap f \vee P = \Theta_2 \cap f \vee P$ then $\Theta_1 \vdash P \iff \Theta_2 \vdash P$,
- $\text{ if } \Theta_1 \cap \text{ fv } N = \Theta_2 \cap \text{ fv } N \text{ then } \Theta_1 \vdash N \iff \Theta_2 \vdash N.$

Proof. By simple mutual induction on P and N.

Corollary 1 (Context Strengthening).

- + If $\Theta \vdash P$ then $f \lor (P) \vdash P$;
- If Θ ⊢ N then fv (N) ⊢ N.

Proof. It follows from Lemma 4 and Lemma 3.

- + By Lemma 3, $fv(P) \subseteq \Theta$, and hence, $\Theta \cap fvP = fvP$, which makes Lemma 4 applicable fore contexts Θ and fv(P).
- The negative case is proven analogously.

+ if
$$\Theta_1 \vdash P$$
 then $\Theta_2 \vdash P$,
- if $\Theta_1 \vdash N$ then $\Theta_2 \vdash N$.

Proof. By Lemma 3, $\Theta_1 \vdash P$ implies $f \lor (P) \subseteq \Theta_1$, which means that $f \lor (P) \subseteq \Theta_2$, and thus, $\mathsf{fv}(P) = \mathsf{fv}(P) \cap \Theta_1 = \mathsf{fv}(P) \cap \Theta_2$. Then by Lemma 4, $\Theta_2 \vdash P$. The negative case is symmetric.

Lemma 5 (Well-formedness agrees with substitution). Suppose that $\Theta_2 \vdash \sigma : \Theta_1$. Then

Corollary 2 (Well-formedness Context Weakening). Suppose that $\Theta_1 \subseteq \Theta_2$, then

- $+ \Theta, \Theta_1 \vdash P \text{ implies } \Theta, \Theta_2 \vdash [\sigma]P, \text{ and }$
- $-\Theta, \Theta_1 \vdash N \text{ implies } \Theta, \Theta_2 \vdash [\sigma]N.$

Proof. We prove it by induction on Θ , $\Theta_1 \vdash P$ and mutually, on Θ , $\Theta_1 \vdash N$. Let us consider the last rule used in the derivation.

Case 1. (VAR₊WF), i.e. P is α^+ . By inversion, $\alpha^+ \in \Theta, \Theta_1$, then

- if $\alpha^+ \in \Theta_1$ then $\Theta_2 \vdash [\sigma] \alpha^+$, and by weakening (Corollary 2), $\Theta_1 \in [\sigma] \alpha^+$;
- if $\alpha^+ \in \Theta \setminus \Theta_1$ then $[\sigma]\alpha^+ = \alpha^+$, and by (VAR^{WF}_+) , Θ , Θ ₂ $\vdash \alpha^+$.

Case 2. (\uparrow^{WF}) , i.e. P is $\downarrow N$.

Then Θ , $\Theta_1 \vdash \bigcup N$ means Θ , $\Theta_1 \vdash N$ by inversion, and by the induction hypothesis, Θ , $\Theta_2 \vdash$ $[\sigma]N$. Then by (\uparrow^{WF}) , Θ , $\Theta_2 \vdash \downarrow [\sigma]N$, which by definition of substitution is rewritten as $\Theta, \Theta_2 \vdash [\sigma] \downarrow N$.

Case 3. (\exists^{WF}) , i.e. P is $\exists \overrightarrow{\alpha}$. Q. Then Θ , $\Theta_1 \vdash \exists \overrightarrow{\alpha^2}$. Q means Θ , $\overrightarrow{\alpha^2}$, $\Theta_1 \vdash Q$ by inversion, and by the induction hypothesis, $\Theta, \overrightarrow{\alpha}, \Theta_2 \vdash [\sigma] Q$. Then by $(\exists^{WF}), \Theta, \overrightarrow{\alpha}, \Theta_2 \vdash \exists \overrightarrow{\alpha}$. $[\sigma] Q$, which by definition of substitution is rewritten as Θ , $\Theta_2 \vdash [\sigma] \exists \overrightarrow{\alpha}$. Q.

Case 4. The negative cases are proved symmetrically.

3.1.2 Substitution.

Lemma 6 (Substitution strengthening). Restricting the substitution to the free variables of the substitution subject does not affect the result. Suppose that σ is a substitution, P and N are types. Then

- + $[\sigma]P = [\sigma|_{\mathsf{f} \vee P}]P$,
- $[\sigma]N = [\sigma|_{\mathsf{fv}\,N}]N$

Proof. First, we strengthen the statement by saying that one can restrict the substitution to an arbitrary superset of the free variables of the substitution subject:

- + $[\sigma]_{P}^{P} = [\sigma|_{vars}]_{P}^{P}$, for any $vars \supseteq f \lor P$, and
- $[\sigma]N = [\sigma]_{vars}N$, for any vars \supseteq fv N.

Then the proof is a straightforward induction on P and mutually, on N. For the base cases:

Case 1. $N = \alpha^-$ Then $\lceil \sigma \rceil \alpha^- = \sigma \rvert_{vars}(\alpha^-)$ by definition, since $\alpha^- \in \text{fv } \alpha^- \subseteq vars$.

Case 2. $N = P \rightarrow M$

2784

2785 2786

2787 2788

2789

2790

2791

2792 2793 Then $[\sigma](P \to M) = [\sigma]P \to [\sigma]M$ by definition. Since $\text{fv } P \subseteq \text{fv } (P \to M) \subseteq \text{vars}$, the induction hypothesis is applicable to $[\sigma]P : [\sigma]P = [\sigma|_{vars}]P$. Analogously, and $[\sigma]M = [\sigma|_{vars}]M$. Then $[\sigma](P \to M) = [\sigma|_{vars}]P \to [\sigma|_{vars}]M = [\sigma|_{vars}](P \to M)$.

Case 3. $N = \uparrow P$ is proved analogously to the previous case.

Case 4. $N = \forall \overrightarrow{\alpha^+}$. M (where $\overrightarrow{\alpha^+}$ is not empty)

Then $[\sigma] \forall \overrightarrow{\alpha^+}. M = \forall \overrightarrow{\alpha^+}. [\sigma] M$ by definition. Let us assume $\overrightarrow{\alpha^+}$ are fresh variables, it means that $\sigma(\alpha^{\pm}) = \alpha^{\pm}$ for any $\alpha^{\pm} \in \overrightarrow{\alpha^+}$, and thus, $\sigma|_{vars} = \sigma|_{(vars \cup \overrightarrow{\alpha^+})}$ immediately from the definition.

Since $vars \subseteq fv(\forall \overrightarrow{\alpha^+}. M) = fvM\setminus \overrightarrow{\alpha^+}, vars \cup \overrightarrow{\alpha^+} \subseteq fv(M)$. Then by the induction hypothesis, $[\sigma]M = [\sigma|_{(vars \cup \overrightarrow{\alpha^+})}]M$. Finally, $[\sigma]\forall \overrightarrow{\alpha^+}. M = \forall \overrightarrow{\alpha^+}. [\sigma|_{(vars \cup \overrightarrow{\alpha^+})}]M = \forall \overrightarrow{\alpha^+}. [\sigma|_{vars}]M = [\sigma|_{vars}]\forall \overrightarrow{\alpha^+}. M$.

Case 5. The positive cases are proven symmetrically.

Lemma 7 (Signature of a restricted substitution). If $\Theta_2 \vdash \sigma : \Theta_1$ then $\Theta_2 \vdash \sigma|_{vars} : \Theta_1 \cap vars$.

Proof. Let us take an arbitrary $\alpha^{\pm} \in \Theta_1 \cap vars$. Since $\alpha^{\pm} \in \Theta_1, \Theta_2 \vdash [\sigma] \alpha^{\pm}$ by the signature of σ .

Let us take an arbitrary $\alpha^{\pm} \notin \Theta_1 \cap vars$. If $\alpha^{\pm} \notin vars$ then $[\sigma|_{vars}]\alpha^{\pm} = \alpha^{\pm}$ by definition of restriction. If $\alpha^{\pm} \in vars \setminus \Theta_1$ then $[\sigma|_{vars}]\alpha^{\pm} = [\sigma]\alpha^{\pm}$ by definition and $[\sigma]\alpha^{\pm} = \alpha^{\pm}$ by the signature of σ .

Lemma 8. Suppose that σ is a substitution with signature $\Theta_2 \vdash \sigma : \Theta_1$. Then if *vars* is disjoint from Θ_1 , then $\sigma|_{vars} = id$.

Proof. Let us take an arbitrary α^{\pm} . If $\alpha^{\pm} \notin vars$ then $[\sigma|_{vars}]\alpha^{\pm} = \alpha^{\pm}$ by definition.

If $\alpha^{\pm} \in vars$ then $\alpha^{\pm} \notin \Theta_1$ by assumption. Then $[\sigma|_{vars}]\alpha^{\pm} = [\sigma]\alpha^{\pm}$ by definition of restricted substitution, and since $\Theta_2 \vdash \sigma : \Theta_1$, we have $[\sigma]\alpha^{\pm} = \alpha^{\pm}$.

Corollary 3 (*Application of a disjoint substitution*). Suppose that σ is a substitution with signature $\Theta_2 \vdash \sigma : \Theta_1$. Then

```
2794 + if \Theta_1 \cap \text{fv}(Q) = \emptyset then [\sigma]Q = Q;

2795 - if \Theta_1 \cap \text{fv}(N) = \emptyset then [\sigma]N = N.
```

 Lemma 9 (Substitution range weakening). Suppose that $\Theta_2 \subseteq \Theta_2'$ are contexts and σ is a substitution. Then $\Theta_2 \vdash \sigma : \Theta_1$ implies $\Theta_2' \vdash \sigma : \Theta_1$.

Proof. For any $\alpha^{\pm} \in \Theta_1$, $\Theta_2 \vdash \sigma : \Theta_1$ gives us $\Theta_2 \vdash [\sigma]\alpha^{\pm}$, which can be weakened to $\Theta_2' \vdash [\sigma]\alpha^{\pm}$ by Corollary 2. This way, $\Theta_2' \vdash \sigma : \Theta_1$.

Lemma 10 (Substitutions Equivalent on Free Variables). Suppose that $\Theta' \subseteq \Theta$, σ_1 and σ_2 are substitutions of signature $\Theta \vdash \sigma_i : \Theta'$. Then

```
+ for a type \Theta \vdash P, if \Theta \vdash [\sigma_1]P \simeq^{\leqslant} [\sigma_2]P then \Theta \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \text{fv } P \cap \Theta';
```

- for a type Θ ⊢
$$N$$
, if Θ ⊢ $[\sigma_1]N \simeq^{\leqslant} [\sigma_2]N$ then Θ ⊢ $\sigma_1 \simeq^{\leqslant} \sigma_2$: fv $N \cap \Theta'$.

Proof. Let us make an additional assumption that σ_1 , σ_2 , and the mentioned types are normalized. If they are not, we normalize them first.

Notice that the normalization preserves the set of free variables (Lemma 40), well-formedness (Corollary 14), and equivalence (Lemma 48), and distributes over substitution (Lemma 43). This way, the assumed and desired properties are equivalent to their normalized versions.

We prove it by induction on the structure of P and mutually, N. Let us consider the shape of this type.

Case 1. $P = \alpha^+ \in \Theta'$. Then $\Theta \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \text{fv } P \cap \Theta'$ means $\Theta \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \alpha^+$, i.e. $\Theta \vdash [\sigma_1]\alpha^+ \simeq^{\leqslant} [\sigma_2]\alpha^+$, which holds by assumption.

Case 2. $P = \alpha^+ \in \Theta \setminus \Theta'$. Then $\text{fv } P \cap \Theta' = \cdot$, so $\Theta \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \text{fv } P \cap \Theta'$ holds vacuously.

Case 3. $P = \downarrow N$. Then the induction hypothesis is applicable to type N:

- (1) N is normalized,
- (2) $\Theta \vdash N$ by inversion of $\Theta \vdash \bigcup N$,
- (3) $\Theta \vdash [\sigma_1]N \simeq^{\leqslant} [\sigma_2]N$ holds by inversion of $\Theta \vdash [\sigma_1] \downarrow N \simeq^{\leqslant} [\sigma_2] \downarrow N$, i.e. $\Theta \vdash \downarrow [\sigma_1]N \simeq^{\leqslant} \downarrow [\sigma_2]N$.

This way, we obtain $\Theta \vdash \sigma_1 \simeq^{\varsigma} \sigma_2 : \mathsf{fv} \, N \cap \Theta'$, which implies the required equivalence since $\mathsf{fv} \, P \cap \Theta' = \mathsf{fv} \, \downarrow N \cap \Theta' = \mathsf{fv} \, N \cap \Theta'$.

Case 4. $P = \exists \overrightarrow{\alpha}$. Q Then the induction hypothesis is applicable to type Q well-formed in context $\Theta, \overrightarrow{\alpha}$:

- (1) $\Theta' \subseteq \Theta, \overrightarrow{\alpha}$ since $\Theta' \subseteq \Theta$,
- (2) $\Theta, \overrightarrow{\alpha} \vdash \sigma_i : \Theta'$ by weakening,

(3) O is normalized,

- (4) $\Theta, \overrightarrow{\alpha} \vdash Q$ by inversion of $\Theta \vdash \exists \overrightarrow{\alpha} : Q$,
- (5) Notice that $[\sigma_i] \exists \overrightarrow{\alpha}^2$. Q is normalized, and thus, $[\sigma_1] \exists \overrightarrow{\alpha}^2$. $Q \simeq^D [\sigma_2] \exists \overrightarrow{\alpha}^2$. Q implies $[\sigma_1] \exists \overrightarrow{\alpha}^2$. $Q = [\sigma_2] \exists \overrightarrow{\alpha}^2$. Q (by Lemma 48).). This equality means $[\sigma_1] Q = [\sigma_2] Q$, which implies $\Theta \vdash [\sigma_1] Q \simeq^s [\sigma_2] Q$.

Case 5. $N = P \rightarrow M$

Lemma 11 (Substitution composition well-formedness). If $\Theta_1' \vdash \sigma_1 : \Theta_1$ and $\Theta_2' \vdash \sigma_2 : \Theta_2$, then $\Theta_1', \Theta_2' \vdash \sigma_2 \circ \sigma_1 : \Theta_1, \Theta_2$.

Proof. By definition of composition.

Lemma 12 (Substitution monadic composition well-formedness). If $\Theta_1' \vdash \sigma_1 : \Theta_1$ and $\Theta_2' \vdash \sigma_2 : \Theta_2$, then $\Theta_2' \vdash \sigma_2 \ll \sigma_1 : \Theta_1$.

Proof. By definition of monadic composition.

Lemma 13 (Substitution composition). If $\Theta_1' \vdash \sigma_1 : \Theta_1, \Theta_2' \vdash \sigma_2 : \Theta_2, \Theta_1 \cap \Theta_2' = \emptyset$ and $\Theta_1 \cap \Theta_2 = \emptyset$ then $\sigma_2 \circ \sigma_1 = (\sigma_2 \ll \sigma_1) \circ \sigma_2$.

Proof.

- (1) Suppose that $\alpha^{\pm} \in \Theta_1$ then $\alpha^{\pm} \notin \Theta_2$, and thus, $[(\sigma_2 \ll \sigma_1) \circ \sigma_2] \alpha^{\pm} = [(\sigma_2 \ll \sigma_1)] \alpha^{\pm} = [\sigma_2] [\sigma_1] \alpha^{\pm} = [(\sigma_2 \circ \sigma_1)] \alpha^{\pm}$.
- (2) Suppose that $\alpha^{\pm} \notin \Theta_1$ then $[(\sigma_2 \circ \sigma_1)]\alpha^{\pm} = [\sigma_2]\alpha^{\pm}$. Then
 - (a) if $\alpha^{\pm} \notin \Theta_2$ then $[\sigma_2]\alpha^{\pm} = \alpha^{\pm}$ and $[(\sigma_2 \ll \sigma_1) \circ \sigma_2]\alpha^{\pm} = [(\sigma_2 \ll \sigma_1)][\sigma_2]\alpha^{\pm} = [\sigma_2 \ll \sigma_1]\alpha^{\pm} = \alpha^{\pm}$
 - (b) if $\alpha^{\pm} \in \Theta_2$ then $\Theta_2' \vdash [\sigma_2]\alpha^{\pm}$, and hence, $[(\sigma_2 \ll \sigma_1) \circ \sigma_2]\alpha^{\pm} = [(\sigma_2 \ll \sigma_1)][\sigma_2]\alpha^{\pm} = [\sigma_2]\alpha^{\pm}$ by definition of monadic composition, since none of the free variables of $[\sigma_2]\alpha^{\pm}$ is in Θ_1 .

Corollary 4 (Substitution composition commutativity). If $\Theta_1' \vdash \sigma_1 : \Theta_1, \Theta_2' \vdash \sigma_2 : \Theta_2$, and $\Theta_1 \cap \Theta_2 = \emptyset$, $\Theta_1 \cap \Theta_2' = \emptyset$, and $\Theta_1' \cap \Theta_2 = \emptyset$ then $\sigma_2 \circ \sigma_1 = \sigma_1 \circ \sigma_2$.

Proof. by Lemma 13, $\sigma_2 \circ \sigma_1 = (\sigma_2 \ll \sigma_1) \circ \sigma_2$. Since the codomain of σ_1 is Θ'_1 , and it is disjoint with the domain of σ_2 , $\sigma_2 \ll \sigma_1 = \sigma_1$.

Lemma 14 (Substitution domain weakening). If $\Theta_2 \vdash \sigma : \Theta_1$ then $\Theta_2, \Theta' \vdash \sigma : \Theta_1, \Theta'$

Proof. If the variable α^{\pm} is in Θ_1 then $\Theta_2 \vdash [\sigma]\alpha^{\pm}$ by assumption, and then $\Theta_2, \Theta' \vdash [\sigma]\alpha^{\pm}$ by weakening. If the variable α^{\pm} is in $\Theta' \setminus \Theta_1$ then $[\sigma]\alpha^{\pm} = \alpha^{\pm} \in \Theta' \subseteq \Theta_2, \Theta'$, and thus, $\Theta_2, \Theta' \vdash \alpha^{\pm}$. \square

Lemma 15 (*Free variables after substitution*). Suppose that $\Theta_2 \vdash \sigma : \Theta_1$, then

+ for a type P, the free variables of $[\sigma]P$ are bounded in the following way: $fv(P) \setminus \Theta_1 \subseteq fv([\sigma]P) \subseteq (fv(P) \setminus \Theta_1) \cup \Theta_2$;

− for a type *N*, the free variables of $[\sigma]$ are bounded in the following way: $fv(N) \setminus \Theta_1 \subseteq fv([\sigma]N) \subseteq (fv(N) \setminus \Theta_1) \cup \Theta_2$.

Proof. We prove it by structural induction on P and mutually, on N.

Case 1. $P = \alpha^+$

 If $\alpha^+ \in \Theta_1$ then $\Theta_2 \vdash [\sigma]\alpha^+$, and by Lemma 3, $fv([\sigma]\alpha^+) \subseteq \Theta_2$. $fv(\alpha^+) \setminus \Theta_1 = \cdot$, so $fv([\sigma]P) \setminus \Theta_1 \subseteq fv([\sigma]\alpha^+)$ vacuously.

If $\alpha^+ \notin \Theta_1$ then $[\sigma]\alpha^+ = \alpha^+$, and fv $([\sigma]\alpha^+) = \alpha^+ = \alpha^+ \setminus \Theta_1$.

Case 2. $P = \exists \overrightarrow{\alpha}$. Q

Then we need to show that $fv([\sigma]P) = fv([\sigma]Q) \setminus \overrightarrow{\alpha}$ is a subset of $(fv(P) \setminus \Theta_1) \cup \Theta_2$ and a superset of $fv(P) \setminus \Theta_1$. Notice that $fv(P) = fv(Q) \setminus \overrightarrow{\alpha}$ by definition. This way, we need to show that $fv(Q) \setminus \overrightarrow{\alpha} \setminus \Theta_1 \subseteq fv([\sigma]Q) \setminus \overrightarrow{\alpha} \subseteq (fv(Q) \setminus \overrightarrow{\alpha} \setminus \Theta_1) \cup \Theta_2$,

By the induction hypothesis, fv ($[\sigma]Q$) \subseteq (fv $(Q) \setminus \Theta_1$) $\cup \Theta_2$. So for the second inclusion, it suffices to show that $((fv(Q) \setminus \Theta_1) \cup \Theta_2) \setminus \overrightarrow{\alpha} \subseteq (fv(Q) \setminus \overrightarrow{\alpha} \setminus \Theta_1) \cup \Theta_2$, which holds by set theoretical reasoning.

Also by the induction hypothesis, $fv(Q) \setminus \Theta_1 \subseteq fv([\sigma]Q)$, and thus, by subtracting $\overrightarrow{\alpha}$ from both sides, $fv(Q) \setminus \overrightarrow{\alpha} \setminus \Theta_1 \subseteq fv([\sigma]Q) \setminus \overrightarrow{\alpha}$.

Case 3. The case $N = \forall \overrightarrow{\alpha^+}$. *M* is proved analogously.

Case 4. $N = P \rightarrow M$

Then $\mathsf{fv}([\sigma]N) = \mathsf{fv}([\sigma]P) \cup \mathsf{fv}([\sigma]M)$. By the induction hypothesis,

- (1) $fv(P) \setminus \Theta_1 \subseteq fv([\sigma]P) \subseteq (fv(P) \setminus \Theta_1) \cup \Theta_2$ and
- (2) $fv(M) \setminus \Theta_1 \subseteq fv([\sigma]M) \subseteq (fv(M) \setminus \Theta_1) \cup \Theta_2$.

We unite these inclusions vertically and obtain $fv(P) \setminus \Theta_1 \cup fv(M) \setminus \Theta_1 \subseteq fv([\sigma]N) \subseteq ((fv(P) \setminus \Theta_1) \cup \Theta_2) \cup ((fv(M) \setminus \Theta_1) \cup \Theta_2)$, which is equivalent to $(fv(P) \cup fv(M)) \setminus \Theta_1 \subseteq fv([\sigma]N) \subseteq (fv(P) \cup fv(M)) \setminus \Theta_1 \cup \Theta_2$. Since $fv(P) \cup fv(M) = fv(N)$, $fv(N) \setminus \Theta_1 \subseteq fv([\sigma]N) \subseteq (fv(N) \setminus \Theta_1) \cup \Theta_2$.

Case 5. The cases when $P = \downarrow M$ and $N = \uparrow Q$ are proved analogously

Lemma 16 (Free variables of a variable image). Suppose that σ is an arbitrary substitution, Then

+ if $\alpha^{\pm} \in \text{fv}(\underline{P})$ then $\text{fv}([\sigma]\alpha^{\pm}) \subseteq \text{fv}([\sigma]\underline{P})$,

, Vol. 1, No. 1, Article . Publication date: July 2024.

```
- if \alpha^{\pm} ∈ fv (N) then fv ([\sigma]\alpha^{\pm}) ⊆ fv ([\sigma]N).
```

Proof. By mutual induction on P and N. The base cases (when P or N is a variable) are trivial, since then $\alpha^{\pm} \in \text{fv}(P)$ means $\alpha^{\pm} = P$ (and symmetrically for N). The congruent cases (when the type is formed by \downarrow , \uparrow , or \rightarrow) hold since α^{\pm} occurs in type means that it occurs in one of its parts, to which we apply the induction hypothesis.

Let us suppose that the type is $\exists \overrightarrow{\alpha}^{-}$. Q. Then $\alpha^{\pm} \in \text{fv}(\exists \overrightarrow{\alpha}^{-}$. Q) means $\alpha^{\pm} \in \text{fv}(Q)$ and $\alpha^{\pm} \notin \overrightarrow{\alpha}^{-}$. Then by the induction hypothesis, $\text{fv}([\sigma]\alpha^{\pm}) \subseteq \text{fv}([\sigma]Q)$, and it is left to notice that $\text{fv}([\sigma]\alpha^{\pm}) \cap \overrightarrow{\alpha}^{-} = \emptyset$, which we can ensure by alpha-equivalence.

3.1.3 Declarative Subtyping.

 Lemma 17 (*Free Variable Propagation*). In the judgments of negative subtyping or positive supertyping, free variables propagate left to right. For a context Θ ,

```
- if Θ \vdash N ≤ M then fv(N) ⊆ fv(M)
```

+ if
$$\Theta \vdash P \geqslant Q$$
 then $fv(P) \subseteq fv(Q)$

Proof. Mutual induction on $\Theta \vdash N \leq M$ and $\Theta \vdash P \geqslant Q$.

Case 1.
$$\Theta \vdash \alpha^- \leq \alpha^-$$

It is self-evident that $\alpha^- \subseteq \alpha^-$.

Case 2. $\Theta \vdash \uparrow P \leq \uparrow Q$ From the inversion (and unfolding $\Theta \vdash P \simeq^{\varsigma} Q$), we have $\Theta \vdash P \geqslant Q$. Then by the induction hypothesis, $f \lor (P) \subseteq f \lor (Q)$. The desired inclusion holds, since $f \lor (\uparrow P) = f \lor (P)$ and $f \lor (\uparrow Q) = f \lor (Q)$.

Case 3. $\Theta \vdash P \to N \leq Q \to M$ The induction hypothesis applied to the premises gives: $fv(P) \subseteq fv(Q)$ and $fv(N) \subseteq fv(M)$. Then $fv(P \to N) = fv(P) \cup fv(N) \subseteq fv(Q) \cup fv(M) = fv(Q \to M)$.

Case 4.
$$\Theta \vdash \forall \overrightarrow{\alpha^{+}}. N \leq \forall \overrightarrow{\beta^{+}}. M$$

$$f \lor \forall \overrightarrow{\alpha^{+}}. N \subseteq f \lor ([\overrightarrow{P}/\overrightarrow{\alpha^{+}}]N) \setminus \overrightarrow{\beta^{+}} \qquad \overrightarrow{\beta^{+}} \text{ is excluded by the premise } f \lor N \cap \overrightarrow{\beta^{+}} = \emptyset$$

$$\subseteq f \lor M \setminus \overrightarrow{\beta^{+}} \qquad \text{by the i.h., } f \lor ([\overrightarrow{P}/\overrightarrow{\alpha^{+}}]N) \subseteq f \lor M$$

$$\subseteq f \lor \forall \overrightarrow{\beta^{+}}. M$$

Case 5. The positive cases are symmetric.

Corollary 5 (Free Variables of mutual subtypes).

```
- If \Theta \vdash N \simeq^{\leq} M then fy N = \text{fy } M.
```

+ If
$$\Theta \vdash P \simeq Q$$
 then $f \lor P = f \lor Q$

, Vol. 1, No. 1, Article . Publication date: July 2024.

Corollary 6. Suppose that all the types below are well-formed in Θ and $\Theta' \subseteq \Theta$. Then

- $+\Theta \vdash P \simeq \emptyset$ implies $\Theta' \vdash P \iff \Theta' \vdash Q$
- $-\Theta \vdash N \simeq^{\leq} M \text{ implies } \Theta' \vdash N \iff \Theta' \vdash M$

Proof. From Lemma 4 and Corollary 5.

Lemma 18 (Decomposition of quantifier rules). Assuming that $\overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}$, $\overrightarrow{\alpha^-}$, and $\overrightarrow{\alpha^-}$ are disjoint from Θ ,

- $-_R \Theta \vdash N \leqslant \forall \overrightarrow{\beta^+}$. M holds if and only if Θ , $\overrightarrow{\beta^+} \vdash N \leqslant M$;
- $+_R \Theta \vdash P \geqslant \exists \overrightarrow{\beta}^-$. Q holds if and only if Θ , $\overrightarrow{\beta}^- \vdash P \geqslant Q$;
- $-_L$ suppose $M \neq \forall \dots$ then $\Theta \vdash \forall \overrightarrow{\alpha^+}. N \leq M$ holds if and only if $\Theta \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N \leq M$ for some $\Theta \vdash \overrightarrow{P}$;
- $+_L$ suppose $Q \neq \exists ...$ then $\Theta \vdash \exists \overrightarrow{\alpha}^{-}. P \geqslant Q$ holds if and only if $\Theta \vdash [\overrightarrow{N}/\overrightarrow{\alpha}^{-}]P \geqslant Q$ for some $\Theta \vdash \overrightarrow{N}$.

Proof.

- $-_R$ Let us prove both directions.
 - ⇒ Let us assume $\Theta \vdash N \leq \forall \overrightarrow{\beta^+}. M. \Theta \vdash N \leq \forall \overrightarrow{\beta^+}. M.$ Let us decompose M as $\forall \overrightarrow{\beta^{+'}}. M'$ where M' does not start with \forall , and decompose N as $\forall \overrightarrow{\alpha^+}. N'$ where N' does not start with \forall . If $\overrightarrow{\beta^+}$ is empty, then $\Theta, \overrightarrow{\beta^+} \vdash N \leq M$ holds by assumption. Otherwise, $\Theta \vdash \forall \overrightarrow{\alpha^+}. N' \leq \forall \overrightarrow{\beta^+}. \forall \overrightarrow{\beta^{+'}}. M$ is inferred by (\forall^{\leq}) , and by inversion: $\Theta, \overrightarrow{\beta^+}, \overrightarrow{\beta^{+'}} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leq M'$ for some $\Theta, \overrightarrow{\beta^+}, \overrightarrow{\beta^{+'}} \vdash \overrightarrow{P}$. Then again by (\forall^{\leq}) with the same $\overrightarrow{P}, \Theta, \overrightarrow{\beta^+} \vdash \forall \overrightarrow{\alpha^+}. N' \leq \forall \overrightarrow{\beta^{+'}}. M'$, that is $\Theta, \overrightarrow{\beta^+} \vdash N \leq M$.
 - ∈ let us assume Θ, $\overrightarrow{\beta^{+}} \vdash N \leq M$, and let us decompose N as $\forall \overrightarrow{\alpha^{+}}. N'$ where N' does not start with \forall , and M as $\forall \overrightarrow{\beta^{+'}}. M'$ where M' does not start with \forall . if $\overrightarrow{\alpha^{+}}$ and $\overrightarrow{\beta^{+'}}$ are empty then Θ, $\overrightarrow{\beta^{+}} \vdash N \leq M$ is turned into Θ $\vdash N \leq \forall \overrightarrow{\beta^{+}}. M$ by (\forall^{\leq}) . Otherwise, Θ, $\overrightarrow{\beta^{+}} \vdash \forall \overrightarrow{\alpha^{+}}. N' \leq \forall \overrightarrow{\beta^{+'}}. M'$ is inferred by (\forall^{\leq}) , that is Θ, $\overrightarrow{\beta^{+}}, \overrightarrow{\beta^{+'}} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^{+}}]N' \leq M'$ for some Θ, $\overrightarrow{\beta^{+}}, \overrightarrow{\beta^{+'}} \vdash \overrightarrow{P}$. Then by (\forall^{\leq}) again, Θ $\vdash \forall \overrightarrow{\alpha^{+}}. N' \leq \forall \overrightarrow{\beta^{+}}, \overrightarrow{\beta^{+'}}. M'$, in other words, Θ $\vdash \forall \overrightarrow{\alpha^{+}}. N' \leq \forall \overrightarrow{\beta^{+}}. \forall \overrightarrow{\beta^{+'}}. M'$, that is Θ $\vdash N \leq \forall \overrightarrow{\beta^{+}}. M$.
- -I Suppose $M \neq \forall \dots$ Let us prove both directions.
 - ⇒ Let us assume $\Theta \vdash \forall \overrightarrow{\alpha^+}. N \leq M$. then if $\overrightarrow{\alpha^+} = \cdot, \Theta \vdash N \leq M$ holds immediately. Otherwise, let us decompose N as $\forall \overrightarrow{\alpha^{+'}}. N'$ where N' does not start with \forall . Then $\Theta \vdash \forall \overrightarrow{\alpha^+}. \forall \overrightarrow{\alpha^{+'}}. N' \leq M'$ is inferred by (\forall^{\leq}) , and by inversion, there exist $\Theta \vdash \overrightarrow{P}$ and $\Theta \vdash \overrightarrow{P}'$ such that $\Theta \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}][\overrightarrow{P}'/\overrightarrow{\alpha^{+'}}]N' \leq M'$ (the decomposition of substitutions is possible since $\overrightarrow{\alpha^+} \cap \Theta = \emptyset$). Then by (\forall^{\leq}) again, $\Theta \vdash \forall \overrightarrow{\alpha^{+'}}. [\overrightarrow{P}'/\overrightarrow{\alpha^{+'}}]N' \leq M'$ (notice that $[\overrightarrow{P}'/\overrightarrow{\alpha^{+'}}]N'$ cannot start with \forall).

 \Leftarrow Let us assume Θ $\vdash [\overrightarrow{P}/\alpha^+]N \leqslant M$ for some Θ $\vdash \overrightarrow{P}$. let us decompose N as $\forall \alpha^{+'}$. N' where N' does not start with \forall . Then Θ $\vdash [\overrightarrow{P}/\alpha^+]\forall \alpha^{+'}$. $N' \leqslant M'$ or, equivalently, Θ $\vdash \forall \alpha^{+'}$. $[\overrightarrow{P}/\alpha^+]N' \leqslant M'$ is inferred by (\forall (notice that $[\overrightarrow{P}/\alpha^+]N'$ cannot start with \forall). By inversion, there exist Θ $\vdash \overrightarrow{P}'$ such that Θ $\vdash [\overrightarrow{P}'/\alpha^{+'}][\overrightarrow{P}/\alpha^+]N' \leqslant M'$. Since $\alpha^{+'}$ is disjoint from the free variables of \overrightarrow{P} and from α^+ , the composition of $\overrightarrow{P}'/\alpha^{+'}$ and $\overrightarrow{P}/\alpha^+$ can be joined into a single substitution well-formed in Θ. Then by (\forall again, Θ $\vdash \forall \alpha^+$. $N \leqslant M$.

+ The positive cases are proved symmetrically.

Corollary 7 (Redundant quantifier elimination).

```
-L Suppose that \overrightarrow{\alpha^+} \cap \text{fv}(N) = \emptyset then \Theta \vdash \forall \overrightarrow{\alpha^+}. N \leq M holds if and only if \Theta \vdash N \leq M;
```

$$-_R$$
 Suppose that $\overrightarrow{\alpha^+} \cap fv(M) = \emptyset$ then $\Theta \vdash N \leq \forall \overrightarrow{\alpha^+}$. M holds if and only if $\Theta \vdash N \leq M$;

$$+_L$$
 Suppose that $\overrightarrow{\alpha} \cap \text{fv}(P) = \emptyset$ then $\Theta \vdash \exists \overrightarrow{\alpha} \cdot P \geqslant Q$ holds if and only if $\Theta \vdash P \geqslant Q$.

$$+_R$$
 Suppose that $\overrightarrow{\alpha} \cap \text{fv}(Q) = \emptyset$ then $\Theta \vdash P \geqslant \exists \overrightarrow{\alpha} \cdot Q$ holds if and only if $\Theta \vdash P \geqslant Q$.

Proof. $\stackrel{-R}{\longrightarrow}$ Suppose that $\overrightarrow{\alpha^+} \cap \text{fv}(M) = \emptyset$ then by Lemma 18, $\Theta \vdash N \leqslant \forall \overrightarrow{\alpha^+} \cdot M$ is equivalent to $\Theta, \overrightarrow{\alpha^+} \vdash N \leqslant M$, By Lemma 4, since $\overrightarrow{\alpha^+} \cap \text{fv}(N) = \emptyset$ and $\overrightarrow{\alpha^+} \cap \text{fv}(M) = \emptyset$, $\Theta, \overrightarrow{\alpha^+} \vdash N \leqslant M$ is equivalent to $\Theta \vdash N \leqslant M$.

- - + The positive cases are proved symmetrically.

Lemma 19 (Subtypes and supertypes of a variable). Assuming $\Theta \vdash \alpha^-$, $\Theta \vdash \alpha^+$, $\Theta \vdash N$, and $\Theta \vdash P$,

+ if
$$\Theta \vdash P \geqslant \exists \overrightarrow{\alpha}^-$$
. α^+ or $\Theta \vdash \exists \overrightarrow{\alpha}^-$. $\alpha^+ \geqslant P$ then $P = \exists \overrightarrow{\beta}^-$. α^+ (for some potentially empty $\overrightarrow{\beta}^-$)

$$-\text{ if }\Theta \vdash N \leqslant \forall \overrightarrow{\alpha^+}. \ \alpha^- \text{ or }\Theta \vdash \forall \overrightarrow{\alpha^+}. \ \alpha^- \leqslant N \text{ then } N = \forall \overrightarrow{\beta^+}. \ \alpha^- \text{ (for some potentially empty } \overrightarrow{\beta^+})$$

Proof. We prove by induction on the tree inferring $\Theta \vdash P \geqslant \exists \overrightarrow{\alpha}^{-}. \alpha^{+}$ or $\Theta \vdash \exists \overrightarrow{\alpha}^{-}. \alpha^{+} \geqslant P$ or or $\Theta \vdash N \leqslant \forall \overrightarrow{\alpha}^{+}. \alpha^{-}$ or $\Theta \vdash \forall \overrightarrow{\alpha}^{+}. \alpha^{-} \leqslant N$.

Let us consider which one of these judgments is inferred.

 Case 1. $\Theta \vdash P \geqslant \exists \overrightarrow{\alpha}$. α^+

 If the size of the inference tree is 1 then the only rule that can infer it is (VAR_+^{\geqslant}) , which implies that $\overrightarrow{\alpha}$ is empty and $P = \alpha^+$.

If the size of the inference tree is > 1 then the last rule inferring it must be (\exists^{\geq}) . By inverting this rule, $P = \exists \overrightarrow{\beta^{-}}$. P' where P' does not start with \exists and Θ , $\overrightarrow{\alpha^{-}} \vdash [\overrightarrow{N}/\overrightarrow{\beta^{-}}]P' \geqslant \alpha^{+}$ for some Θ , $\overrightarrow{\alpha^{-}} \vdash N_{i}$.

By the induction hypothesis, $[\overrightarrow{N}/\overrightarrow{\beta^-}]P' = \exists \overrightarrow{\gamma^-}. \alpha^+$. What shape can P' have? As mentioned, it does not start with \exists , and it cannot start with \uparrow (otherwise, $[\overrightarrow{N}/\overrightarrow{\alpha^-}]P'$ would also start with \uparrow and would not be equal to $\exists \overrightarrow{\beta^-}. \alpha^+$). This way, P' is a *positive* variable. As such, $[\overrightarrow{N}/\overrightarrow{\alpha^-}]P' = P'$, and then $P' = \exists \overrightarrow{\gamma^-}. \alpha^+$ meaning that $\overrightarrow{\gamma^-}$ is empty and $P' = \alpha^+$. This way, $P = \exists \overrightarrow{\beta^-}. P' = \exists \overrightarrow{\beta^-}. \alpha^+$, as required.

Case 2. $\Theta \vdash \exists \overrightarrow{\alpha}^- . \alpha^+ \geqslant P$

If the size of the inference tree is 1 then the only rule that can infer it is (VAR_+^{\geqslant}) , which implies that $\overrightarrow{\alpha}^{=}$ is empty and $P = \alpha^{+}$.

If the size of the inference tree is > 1 then the last rule inferring it must be $(\exists^{>})$. By inverting this rule, $P = \exists \overrightarrow{\beta^{-}}$. Q where Θ , $\overrightarrow{\beta^{-}} \vdash [\overrightarrow{N}/\overrightarrow{\alpha^{-}}]\alpha^{+} \geqslant Q$ and Q does not start with \exists . Notice that since α^{+} is positive, $[\overrightarrow{N}/\overrightarrow{\alpha^{-}}]\alpha^{+} = \alpha^{+}$, i.e. Θ , $\overrightarrow{\beta^{-}} \vdash \alpha^{+} \geqslant Q$.

By the induction hypothesis, $Q = \exists \overrightarrow{\beta^{-}}' \cdot \alpha^{+}$, and since Q does not start with \exists , $\overrightarrow{\beta^{-}}'$ is empty This way, $P = \exists \overrightarrow{\beta^{-}} \cdot Q = \exists \overrightarrow{\beta^{-}} \cdot \alpha^{+}$, as required.

Case 3. The negative cases $(\Theta \vdash N \leq \forall \overrightarrow{\alpha^+}, \alpha^- \text{ and } \Theta \vdash \forall \overrightarrow{\alpha^+}, \alpha^- \leq N)$ are proved analogously.

Corollary 8 (*Variables have no proper subtypes and supertypes*). Assuming that all mentioned types are well-formed in Θ ,

$$\Theta \vdash P \geqslant \alpha^{+} \iff P = \exists \overrightarrow{\beta^{-}}. \alpha^{+} \iff \Theta \vdash P \simeq^{\leqslant} \alpha^{+} \iff P \simeq^{D} \alpha^{+}$$

$$\Theta \vdash \alpha^{+} \geqslant P \iff P = \exists \overrightarrow{\beta^{-}}. \alpha^{+} \iff \Theta \vdash P \simeq^{\leqslant} \alpha^{+} \iff P \simeq^{D} \alpha^{+}$$

$$\Theta \vdash N \leqslant \alpha^{-} \iff N = \forall \overrightarrow{\beta^{+}}. \alpha^{-} \iff \Theta \vdash N \simeq^{\leqslant} \alpha^{-} \iff N \simeq^{D} \alpha^{-}$$

$$\Theta \vdash \alpha^{-} \leqslant N \iff N = \forall \overrightarrow{\beta^{+}}. \alpha^{-} \iff \Theta \vdash N \simeq^{\leqslant} \alpha^{-} \iff N \simeq^{D} \alpha^{-}$$

Proof. Notice that $\Theta \vdash \exists \overrightarrow{\beta^-}. \alpha^+ \simeq^{\leqslant} \alpha^+$ and $\exists \overrightarrow{\beta^-}. \alpha^+ \simeq^D \alpha^+$ and apply Lemma 19.

Lemma 20 (*Subtyping context irrelevance*). Suppose that all the mentioned types are well-formed in Θ_1 and Θ_2 . Then

- + $\Theta_1 \vdash P \geqslant Q$ is equivalent to $\Theta_2 \vdash P \geqslant Q$;
- Θ₁ \vdash N ≤ M is equivalent to Θ₂ \vdash N ≤ M.

, Vol. 1, No. 1, Article . Publication date: July 2024.

Proof. We prove it by induction on the size of $\Theta_1 \vdash P \geqslant Q$ and mutually, the size of $\Theta_1 \vdash N \leqslant M$.

All the cases except (\exists^{\geqslant}) and (\forall^{\leqslant}) are proven congruently: first, we apply the inversion to $\Theta_1 \vdash P \geqslant Q$ to obtain the premises of the corresponding rule X, then we apply the induction hypothesis to each premise, and build the inference tree (with Θ_2) by the same rule X.

Suppose that the judgment is inferred by (\exists^{\geqslant}) . Then we are proving that $\Theta_1 \vdash \exists \overrightarrow{\alpha}^{\Rightarrow}$. $P \geqslant \exists \overrightarrow{\beta}^{\Rightarrow}$. Q implies $\Theta_2 \vdash \exists \overrightarrow{\alpha}^{\Rightarrow}$. $P \geqslant \exists \overrightarrow{\beta}^{\Rightarrow}$. Q (the other implication is proven symmetrically).

By inversion of $\Theta_1 \vdash \overrightarrow{\exists \alpha}$. $P \geqslant \overrightarrow{\beta}$. Q, we obtain σ such that Θ_1 , $\overrightarrow{\beta}^2 \vdash \sigma : \overrightarrow{\alpha}$ and Θ_1 , $\overrightarrow{\beta}^2 \vdash [\sigma]P \geqslant Q$. By Lemma 17, fv ($[\sigma]P$) \subseteq fv (Q).

From the well-formedness statements $\Theta_i \vdash \exists \overrightarrow{\alpha}$. P and $\Theta_i \vdash \exists \overrightarrow{\beta}$. Q we have:

- $\Theta_1, \overrightarrow{\alpha} \vdash P$, which also means $\Theta_1, \overrightarrow{\beta} \vdash [\sigma]P$ by Lemma 5;
- $\Theta_2, \overrightarrow{\alpha} \vdash P$;

3166

3168

3170

3172

3174

3176

3177

3178

3179 3180

3181 3182 3183

- $\Theta_1, \overrightarrow{\beta}^- \vdash Q$; and
- Θ_2 , $\overrightarrow{\beta}^- \vdash Q$, which means $\mathsf{fv}(Q) \subseteq \Theta_2$, $\overrightarrow{\beta}^-$ by Lemma 3, and combining it with $\mathsf{fv}([\sigma]P) \subseteq \mathsf{fv}(Q)$, we have $\mathsf{fv}([\sigma]P) \subseteq \Theta_2$, $\overrightarrow{\beta}^-$.

Let us construct a substitution σ_0 in the following way:

$$\begin{cases} [\sigma_0]\alpha_i^- = [\sigma]\alpha_i^- & \text{for } \alpha_i^- \in \overrightarrow{\alpha} \cap \text{fv } (P) \\ [\sigma_0]\alpha_i^- = \forall \gamma^+. \uparrow \gamma^+ & \text{for } \alpha_i^- \in \overrightarrow{\alpha} \setminus \text{fv } (P) \\ [\sigma_0]\gamma^\pm = \gamma^\pm & \text{for any other } \gamma^\pm \end{cases}$$

Notice that

- (1) $[\sigma_0]P = [\sigma]P$. Since $\sigma_0|_{\mathsf{fv}(P)} = \sigma|_{\mathsf{fv}(P)}$ as functions (which follows from the construction of σ_0 and the signature of σ), $[\sigma_0]P = [\sigma_0|_{\mathsf{fv}(P)}]P = [\sigma|_{\mathsf{fv}(P)}]P = [\sigma]P$ (where the first and the last equalities are by Lemma 6).
- (2) fv ($[\sigma]$ P) $\vdash \sigma_0 : \overrightarrow{\alpha}$. To show that, let us consider α_i
 - if $\alpha_i^- \in \overrightarrow{\alpha}^- \setminus \mathsf{fv}\left({\color{red} P} \right)$ then $\cdot \vdash [\sigma_0]\alpha_i^-$, which can be weakened to $\mathsf{fv}\left([\sigma] {\color{red} P} \right) \vdash [\sigma_0]\alpha_i^-$;
 - if $\alpha_i^- \in \overrightarrow{\alpha}^- \cap \text{fv}(P)$, we have $[\sigma_0]\alpha_i^- = [\sigma]\alpha_i^-$, and thus, by specification of σ , Θ_1 , $\overrightarrow{\beta}^+ \vdash [\sigma_0]\alpha_i^-$. By Corollary 1, it means $\text{fv}([\sigma_0]\alpha_i^-) \vdash [\sigma_0]\alpha_i^-$, which we weaken (Corollary 2) to $\text{fv}([\sigma]P) \vdash [\sigma_0]\alpha_i^-$ (since $\text{fv}([\sigma_0]\alpha_i^-) \subseteq \text{fv}([\sigma_0]P)$ by Lemma 16, and $[\sigma_0]P = [\sigma]P$, as noted above).

By Corollary 1, Θ_1 , $\overrightarrow{\beta^-} \vdash [\sigma] P$ implies $\mathsf{fv}([\sigma] P) \vdash [\sigma] P$, which, since $\mathsf{fv}([\sigma] P) \subseteq \Theta_2$, $\overrightarrow{\beta^-}$, is weakened to Θ_2 , $\overrightarrow{\beta^-} \vdash [\sigma] P$. and rewritten as Θ_2 , $\overrightarrow{\beta^-} \vdash [\sigma_0] P$.

Notice that the premises of the induction hold:

- 3186 (1) $\Theta_i, \overrightarrow{\beta}^- \vdash [\sigma_0]P$,
- 3188 (2) $\Theta_i, \overrightarrow{\beta}^- \vdash Q$, and

3233 3234 (3) $\Theta_1, \overrightarrow{\beta^-} \vdash [\sigma_0]P \geqslant Q$, notice that the tree inferring this judgment is the same tree inferring $\Theta_1, \overrightarrow{\beta^-} \vdash [\sigma]P \geqslant Q$ (since $[\sigma_0]P = [\sigma]P$), i.e., it is a subtree of $\Theta_1 \vdash \exists \overrightarrow{\alpha^-} \cdot P \geqslant \exists \overrightarrow{\beta^-} \cdot Q$.

This way, by the induction hypothesis, Θ_2 , $\overrightarrow{\beta^-} \vdash [\sigma_0] P \geqslant Q$. Combining it with Θ_2 , $\overrightarrow{\beta^-} \vdash \sigma_0 : \overrightarrow{\alpha^-}$ by (\exists^{\geqslant}) , we obtain $\Theta_2 \vdash \exists \overrightarrow{\alpha^-} : P \geqslant \exists \overrightarrow{\beta^-} : Q$.

The case of $\Theta_1 \vdash \forall \overrightarrow{\alpha^+}$. $N \leqslant \forall \overrightarrow{\beta^+}$. M is symmetric.

Lemma 21 (Weakening of subtyping context). Suppose Θ_1 and Θ_2 are contexts and $\Theta_1 \subseteq \Theta_2$. Then

- + $\Theta_1 \vdash P \geqslant Q$ implies $\Theta_2 \vdash P \geqslant Q$;
- Θ₁ \vdash N ≤ M implies Θ₂ \vdash N ≤ M.

Proof. By straightforward induction on the subtyping derivation. The polymorphic cases follow from Lemma 9.

Lemma 22 (*Reflexivity of subtyping*). Assuming all the types are well-formed in Θ ,

- $-\Theta \vdash N \leq N$
- $+\Theta \vdash P \geqslant P$

Proof. Let us prove it by the size of N and mutually, P.

Case 1. $N = \alpha^-$

Then $\Theta \vdash \alpha^- \leq \alpha^-$ is inferred immediately by (VAR $^{\leq}$).

Case 2. $N = \forall \overrightarrow{\alpha^+}$. N' where $\overrightarrow{\alpha^+}$ is not empty

First, we rename α^{+} to fresh β^{+} in $\forall \alpha^{+}$. N' to avoid name clashes: $\forall \alpha^{+}$. $N' = \forall \beta^{+}$. $[\alpha^{+}/\beta^{+}]N'$. Then to infer $\Theta \vdash \forall \alpha^{+}$. $N' \leq \forall \beta^{+}$. $[\alpha^{+}/\beta^{+}]N'$ we can apply (\forall^{\leq}) , instantiating α^{+} with β^{+} :

- $\text{fv } N \cap \overrightarrow{\beta^+} = \emptyset \text{ by choice of } \overrightarrow{\beta^+},$
- Θ , $\overrightarrow{\beta}^+ \vdash \beta^+_i$,
- Θ , $\overrightarrow{\beta^+} \vdash [\overrightarrow{\beta^+}/\overrightarrow{\alpha^+}]N' \leqslant [\overrightarrow{\beta^+}/\overrightarrow{\alpha^+}]N'$ by the induction hypothesis, since the size of $[\overrightarrow{\beta^+}/\overrightarrow{\alpha^+}]N'$ is equal to the size of N', which is smaller than the size of $N = \forall \overrightarrow{\alpha^+}. N'$.

Case 3. $N = P \rightarrow M$

Then $\Theta \vdash P \to M \leq P \to M$ is inferred by (\to^{\leq}) , since $\Theta \vdash P \geq P$ and $\Theta \vdash M \leq M$ hold the induction hypothesis.

Case 4. $N = \uparrow P$

Then $\Theta \vdash \uparrow P \leq \uparrow P$ is inferred by (\uparrow^{\leq}) , since $\Theta \vdash P \geq P$ holds by the induction hypothesis.

, Vol. 1, No. 1, Article . Publication date: July 2024.

Case 5. The positive cases are symmetric to the negative ones.

3235

Lemma 23 (*Substitution preserves subtyipng*). Suppose that all mentioned types are well-formed in Θ_1 , and σ is a substitution $\Theta_2 \vdash \sigma : \Theta_1$.

- If Θ_1 ⊢ $N \le M$ then Θ_2 ⊢ $[\sigma]N \le [\sigma]M$.
- + If $\Theta_1 \vdash P \geqslant Q$ then $\Theta_2 \vdash [\sigma]P \geqslant [\sigma]Q$.

Proof. We prove it by induction on the size of the derivation of $\Theta_1 \vdash N \leq M$ and mutually, $\Theta_1 \vdash P \geq Q$. Let us consider the last rule used in the derivation:

Case 1. (VAR $^{\leq}$). Then by inversion, $N = \alpha^{-}$ and $M = \alpha^{-}$. By reflexivity of subtyping (Lemma 22), we have $\Theta_2 \vdash [\sigma]\alpha^{-} \leq [\sigma]\alpha^{-}$, i.e. $\Theta_2 \vdash [\sigma]N \leq [\sigma]M$, as required.

Case 2. (\forall^{\leq}) . Then by inversion, $N = \forall \overrightarrow{\alpha^+}. N', M = \forall \overrightarrow{\beta^+}. M'$, where $\overrightarrow{\alpha^+}$ or $\overrightarrow{\beta^+}$ is not empty. Moreover, $\Theta_1, \overrightarrow{\beta^+} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leq M'$ for some $\Theta_1, \overrightarrow{\beta^+} \vdash \overrightarrow{P}$, and fv $N \cap \overrightarrow{\beta^+} = \emptyset$.

Notice that since the derivation of Θ_1 , $\overrightarrow{\beta^+} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leqslant M'$ is a subderivation of the derivation of $\Theta \vdash N \leqslant M$, its size is smaller, and hence, the induction hypothesis applies $(\Theta_1, \overrightarrow{\beta^+} \vdash \sigma : \Theta_1, \overrightarrow{\beta^+})$ by Lemma 14): $(\Theta_2, \overrightarrow{\beta^+}) \vdash [\sigma][\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leqslant [\sigma]M'$.

Notice that by convention, $\overrightarrow{\alpha^+}$ and $\overrightarrow{\beta^+}$ are fresh, and thus, $[\sigma] \forall \overrightarrow{\alpha^+}. N' = \forall \overrightarrow{\alpha^+}. [\sigma] N'$ and $[\sigma] \forall \overrightarrow{\beta^+}. M' = \forall \overrightarrow{\beta^+}. [\sigma] M'$, which means that the required $\Theta_2, \Theta \vdash [\sigma] \forall \overrightarrow{\alpha^+}. N' \leq [\sigma] \forall \overrightarrow{\beta^+}. M'$ is rewritten as $\Theta_2, \Theta \vdash \forall \overrightarrow{\alpha^+}. [\sigma] N' \leq \forall \overrightarrow{\beta^+}. [\sigma] M'$.

To infer it, we apply (\forall^{\leq}) , instantiating α^+_i with $[\sigma]_i^P$:

- fv $[\sigma]N \cap \overrightarrow{\beta^+} = \emptyset$;
- $\Theta_2, \Theta, \overrightarrow{\beta^+} \vdash [\sigma] P_i$, by Lemma 5 since from the inversion, $\Theta_1, \Theta, \overrightarrow{\beta^+} \vdash P_i$;
- $\Theta, \overrightarrow{\beta^+} \vdash [[\sigma] \overrightarrow{P}/\overrightarrow{\alpha^+}][\sigma] N' \leqslant [\sigma] M'$ holds by Lemma 13: Since $\overrightarrow{\alpha^+}$ is fresh, it is disjoint with the domain and the codomain of σ (Θ_1 and Θ_2), and thus, $[\sigma][\overrightarrow{P}/\overrightarrow{\alpha^+}]N' = [\sigma \ll \overrightarrow{P}/\overrightarrow{\alpha^+}][\sigma]N' = [[\sigma]\overrightarrow{P}/\overrightarrow{\alpha^+}][\sigma]N'$. Then $\Theta_2, \Theta, \overrightarrow{\beta^+} \vdash [\sigma][\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leqslant [\sigma]M'$ holds by the induction hypothesis.
- **Case** 3. (\to^{\leq}) . Then by inversion, $N = P \to N_1$, $M = Q \to M_1$, $\Theta \vdash P \geqslant Q$, and $\Theta \vdash N_1 \leqslant M_1$. And by the induction hypothesis, $\Theta' \vdash [\sigma]P \geqslant [\sigma]Q$ and $\Theta' \vdash [\sigma]N_1 \leqslant [\sigma]M_1$. Then $\Theta' \vdash [\sigma]N \leqslant [\sigma]M$, i.e. $\Theta' \vdash [\sigma]P \to [\sigma]N_1 \leqslant [\sigma]Q \to [\sigma]M_1$, is inferred by (\to^{\leq}) .
- **Case 4.** (\uparrow^{\leq}). Then by inversion, $N = \uparrow P$, $M = \uparrow Q$, and $\Theta \vdash P \simeq^{\leq} Q$, which by inversion means that $\Theta \vdash P \geqslant Q$ and $\Theta \vdash Q \geqslant P$. Then the induction hypothesis applies, and we have $\Theta' \vdash [\sigma]P \geqslant [\sigma]Q$ and $\Theta' \vdash [\sigma]Q \geqslant [\sigma]P$. Then by sequential application of (\simeq^{\leq}) and (\uparrow^{\leq}) to these judgments, we have $\Theta' \vdash \uparrow [\sigma]P \leqslant \uparrow [\sigma]Q$, i.e. $\Theta' \vdash [\sigma]N \leqslant [\sigma]M$, as required.
- Case 5. The positive cases are proved symmetrically.

3282 3283

 Corollary 9 (Substitution preserves subtyping induced equivalence). Suppose that $\Theta \vdash \sigma : \Theta_1$. Then

- 3288 + if $\Theta_1 \vdash P$, $\Theta_1 \vdash Q$, and $\Theta_1 \vdash P \simeq^{\leq} Q$ then $\Theta \vdash [\sigma]P \simeq^{\leq} [\sigma]Q$
 - if $\Theta_1 \vdash N$, $\Theta_1 \vdash M$, and $\Theta_1 \vdash N \simeq^{\leq} M$ then $\Theta \vdash [\sigma]N \simeq^{\leq} [\sigma]M$

Lemma 24 (*Transitivity of subtyping*). Assuming the types are well-formed in Θ ,

- if Θ ⊢ $N_1 \le N_2$ and Θ ⊢ $N_2 \le N_3$ then Θ ⊢ $N_1 \le N_3$,
- + if $\Theta \vdash P_1 \geqslant P_2$ and $\Theta \vdash P_2 \geqslant P_3$ then $\Theta \vdash P_1 \geqslant P_3$.

Proof. To prove it, we formulate a stronger property, which will imply the required one, taking $\sigma = \Theta + id : \Theta$.

Assuming all the types are well-formed in Θ ,

- $\text{ if } \Theta \vdash N \leqslant M_1, \Theta \vdash M_2 \leqslant K, \text{ and for } \Theta' \vdash \sigma : \Theta, [\sigma]M_1 = [\sigma]M_2 \text{ then } \Theta' \vdash [\sigma]N \leqslant [\sigma]K$
- + if $\Theta \vdash P \geqslant Q_1$, $\Theta \vdash Q_2 \geqslant R$, and for $\Theta' \vdash \sigma : \Theta$, $[\sigma]Q_1 = [\sigma]Q_2$ then $\Theta' \vdash [\sigma]P \geqslant [\sigma]R$

We prove it by induction on $\operatorname{size}(\Theta \vdash N \leq M_1) + \operatorname{size}(\Theta \vdash M_2 \leq K)$ and mutually, on $\operatorname{size}(\Theta \vdash P \geq Q_1) + \operatorname{size}(\Theta \vdash Q_2 \geq R)$.

First, let us consider the 3 important cases.

Case 1. Let us consider the case when $M_1 = \forall \overrightarrow{\beta^+}_1. \alpha^-$. Then by Lemma 19, $\Theta \vdash N \leqslant M_1$ means that $N = \forall \overrightarrow{\alpha^+}. \alpha^-$. $[\sigma]M_1 = [\sigma]M_2$ means that $\forall \overrightarrow{\beta^+}_1. [\sigma]\alpha^- = [\sigma]M_2$. Applying σ to both sides of $\Theta \vdash M_2 \leqslant K$ (by Lemma 23), we obtain $\Theta' \vdash [\sigma]M_2 \leqslant [\sigma]K$, that is $\Theta' \vdash \forall \overrightarrow{\beta^+}_1. [\sigma]\alpha^- \leqslant [\sigma]K$. Since $\mathsf{fv}([\sigma]\alpha^-) \subseteq \Theta, \alpha^-$, it is disjoint from α^+ and β^+ , This way, by Corollary 7, $\Theta' \vdash \forall \overrightarrow{\beta^+}_1. [\sigma]\alpha^- \leqslant [\sigma]K$ is equivalent to $\Theta' \vdash [\sigma]\alpha^- \leqslant [\sigma]K$, which is equivalent to $\Theta' \vdash \forall \alpha^+$. $[\sigma]\alpha^- \leqslant [\sigma]K$, that is $\Theta' \vdash [\sigma]N \leqslant [\sigma]K$.

Case 2. Let us consider the case when $M_2 = \forall \overrightarrow{\beta}^+_2$. α^- . This case is symmetric to the previous one. Notice that Lemma 19 and Corollary 7 are agnostic to the side on which the quantifiers occur, and thus, the proof stays the same.

Case 3. Let us decompose the types, by extracting the outer quantifiers:

- $N = \forall \overrightarrow{\alpha^+}. N'$, where $N' \neq \forall ...$,
- $M_1 = \forall \overrightarrow{\beta^+}_1 . M'_1$, where $M'_1 \neq \forall ...$,
- $M_2 = \forall \overrightarrow{\beta^+}_2$. M'_2 , where $M'_2 \neq \forall \dots$,
- $K = \forall \overrightarrow{y^+}$. K', where $K' \neq \forall \dots$

and assume that at least one of $\overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}_1$, $\overrightarrow{\beta^+}_2$, and $\overrightarrow{\gamma^+}$ is not empty. Since $[\sigma]M_1 = [\sigma]M_2$, we have $\forall \overrightarrow{\beta^+}_1$. $[\sigma]M_1' = \forall \overrightarrow{\beta^+}_2$. $[\sigma]M_2'$, and since M_i' are not variables (which was covered by the previous cases) and do not start with \forall , $[\sigma]M_i'$ do not start with \forall either, which means $\overrightarrow{\beta^+}_1 = \overrightarrow{\beta^+}_2$ and $[\sigma]M_1' = [\sigma]M_2'$. Let us rename $\overrightarrow{\beta^+}_1$ and $\overrightarrow{\beta^+}_2$ to $\overrightarrow{\beta^+}$. Then $M_1 = \forall \overrightarrow{\beta^+}$. M_1' and $M_2 = \forall \overrightarrow{\beta^+}$. M_2' .

By Lemma 18 applied twice to $\Theta \vdash \forall \overrightarrow{\alpha^+}. \ N' \leqslant \forall \overrightarrow{\beta^+}. \ M'_1$ and to $\Theta \vdash \forall \overrightarrow{\beta^+}. \ M'_2 \leqslant \forall \overrightarrow{\gamma^+}. \ K'$, we have the following:

(1)
$$\Theta, \overrightarrow{\beta^+} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leq M'_1 \text{ for some } \Theta, \overrightarrow{\beta^+} \vdash \overrightarrow{P};$$

(2)
$$\Theta, \overrightarrow{\gamma^+} \vdash [\overrightarrow{Q}/\overrightarrow{\beta^+}]M_2' \leq K' \text{ for some } \Theta, \overrightarrow{\gamma^+} \vdash \overrightarrow{Q}.$$

And since at least one of $\overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}$, and $\overrightarrow{\gamma^+}$ is not empty, either $\Theta \vdash N \leqslant M_1$ or $\Theta \vdash M_2 \leqslant K$ is inferred by (\forall^{\leqslant}) , meaning that either Θ , $\overrightarrow{\beta^+} \vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leqslant M'_1$ is a proper subderivation of $\Theta \vdash N \leqslant M_1$ or Θ , $\overrightarrow{\gamma^+} \vdash [\overrightarrow{Q}/\overrightarrow{\beta^+}]M'_2 \leqslant K'$ is a proper subderivation of $\Theta \vdash M_2 \leqslant K$.

Notice that we can weaken and rearrange the contexts without changing the sizes of the derivations: Θ , $\overrightarrow{\beta^+}$, $\overrightarrow{\gamma^+}$ $\vdash [\overrightarrow{P}/\overrightarrow{\alpha^+}]N' \leq M'_1$ and Θ , $\overrightarrow{\beta^+}$, $\overrightarrow{\gamma^+}$ $\vdash [\overrightarrow{Q}/\overrightarrow{\beta^+}]M'_2 \leq K'$. This way, the sum of the sizes of these derivations is smaller than the sum of the sizes of $\Theta \vdash N \leq M_1$ and $\Theta \vdash M_2 \leq K$. Let us apply the induction hypothesis to these derivations, with the substitution Θ' , $\overrightarrow{\gamma^+}$ $\vdash \sigma \circ (\overrightarrow{Q}/\overrightarrow{\beta^+})$: Θ , $\overrightarrow{\beta^+}$, $\overrightarrow{\gamma^+}$ (Lemma 14). To apply the induction hypothesis, it is left to show that $\sigma \circ (\overrightarrow{Q}/\overrightarrow{\beta^+})$ unifies M'_1 and $[\overrightarrow{Q}/\overrightarrow{\beta^+}]M'_2$:

$$[\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}]M'_{1} = [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^{+}}]M'_{1}$$

$$= [[\sigma]\overrightarrow{Q}/\overrightarrow{\beta^{+}}][\sigma]M'_{2} \qquad \text{by Lemma 13}$$

$$= [[\sigma]\overrightarrow{Q}/\overrightarrow{\beta^{+}}][\sigma]M'_{2} \qquad \text{Since } [\sigma]M'_{1} = [\sigma]M'_{2}$$

$$= [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^{+}}]M'_{2} \qquad \text{by Lemma 13}$$

$$= [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^{+}}][\overrightarrow{Q}/\overrightarrow{\beta^{+}}]M'_{2} \qquad \text{Since } \Theta, \overrightarrow{\gamma^{+}} \vdash \overrightarrow{Q}, \text{ and } (\Theta, \overrightarrow{\gamma^{+}}) \cap \overrightarrow{\beta^{+}} = \emptyset$$

$$= [\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}][\overrightarrow{Q}/\overrightarrow{\beta^{+}}]M'_{2}$$

This way the induction hypothesis gives us $\Theta', \overrightarrow{\gamma^+} \vdash [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^+}][\overrightarrow{P}/\alpha^+]N' \leqslant [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^+}]K'$, and since $\Theta, \overrightarrow{\gamma^+} \vdash K', [\overrightarrow{Q}/\overrightarrow{\beta^+}]K' = K'$, that is $\Theta', \overrightarrow{\gamma^+} \vdash [\sigma][\overrightarrow{Q}/\overrightarrow{\beta^+}][\overrightarrow{P}/\alpha^+]N' \leqslant [\sigma]K'$. Let us rewrite the substitution that we apply to N':

$$[\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}} \circ \overrightarrow{P}/\overrightarrow{\alpha^{+}}]N' = [(\sigma \ll \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \circ \sigma \circ \overrightarrow{P}/\overrightarrow{\alpha^{+}}]N'$$
by Lemma 13
$$= [(\sigma \ll \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \circ (\sigma \ll \overrightarrow{P}/\overrightarrow{\alpha^{+}}) \circ \sigma]N'$$
by Lemma 13
$$= [(((\sigma \ll \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \circ \sigma) \ll \overrightarrow{P}/\overrightarrow{\alpha^{+}}) \circ \sigma]N'$$
fv $([\sigma]N') \cap \overrightarrow{\beta^{+}} = \emptyset$

$$= [((\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \ll \overrightarrow{P}/\overrightarrow{\alpha^{+}}) \circ \sigma]N'$$
by Lemma 13
$$= [(\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \ll \overrightarrow{P}/\overrightarrow{\alpha^{+}}][\sigma]N'$$

Notice that $(\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \ll \overrightarrow{P}/\overrightarrow{\alpha^{+}}$ is a substitution that turns α^{+}_{i} into $[\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}]P_{i}$, where $\Theta', \overrightarrow{\gamma^{+}} \vdash [\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}]P_{i}$. This way, $\Theta', \overrightarrow{\gamma^{+}} \vdash [(\sigma \circ \overrightarrow{Q}/\overrightarrow{\beta^{+}}) \ll \overrightarrow{P}/\overrightarrow{\alpha^{+}}][\sigma]N' \leqslant [\sigma]K'$ means $\Theta \vdash \forall \overrightarrow{\alpha^{+}}. [\sigma]N' \leqslant \forall \overrightarrow{\gamma^{+}}. [\sigma]K'$ by Lemma 18, that is $\Theta \vdash [\sigma]N \leqslant [\sigma]K$, as required.

Now, we can assume that neither $\Theta \vdash N \leq M_1$ nor $\Theta \vdash M_2 \leq K$ is inferred by (\forall^{\leq}) , and that neither M_1 nor M_2 is equivalent to a variable. Because of that, $[\sigma]M_1 = [\sigma]M_2$ means that M_1 and M_2 have the same outer constructor. Let us consider the shape of M_1 .

Case 1. $M_1 = \alpha^-$ this case has been considered;

 Case 2. $M_1 = \forall \overrightarrow{\beta^+}$. M'_1 this case has been considered;

Case 3. $M_1 = \uparrow Q_1$. Then as noted above, $[\sigma]M_1 = [\sigma]M_2$ means that $M_2 = \uparrow Q_2$ and $[\sigma]Q_1 = [\sigma]Q_2$. Moreover, $\Theta \vdash N \leqslant \uparrow Q_1$ can only be inferred by (\uparrow^{\leqslant}) , and thus, $N = \uparrow P$, and by inversion, $\Theta \vdash P \geqslant Q_1$ and $\Theta \vdash Q_1 \geqslant P$. Analogously, $\Theta \vdash \uparrow Q_2 \leqslant K$ means that $K = \uparrow R$, $\Theta \vdash Q_2 \geqslant R$, and $\Theta \vdash R \geqslant Q_2$.

Notice that the derivations of $\Theta \vdash P \geqslant Q_1$ and $\Theta \vdash Q_1 \geqslant P$ are proper sub-derivations of $\Theta \vdash N \leqslant M_1$, and the derivations of $\Theta \vdash Q_2 \geqslant R$ and $\Theta \vdash R \geqslant Q_2$ are proper sub-derivations of $\Theta \vdash M_2 \leqslant K$. This way, the induction hypothesis is applicable:

- applying the induction hypothesis to $\Theta \vdash P \geqslant Q_1$ and $\Theta \vdash Q_2 \geqslant R$ with $\Theta' \vdash \sigma : \Theta$ unifying Q_1 and Q_2 , we obtain $\Theta' \vdash [\sigma]P \geqslant [\sigma]R$;
- applying the induction hypothesis to $\Theta \vdash R \ge Q_2$ and $\Theta \vdash Q_1 \ge P$ with $\Theta' \vdash \sigma : \Theta$ unifying Q_2 and Q_1 , we obtain $\Theta' \vdash [\sigma]R \ge [\sigma]P$.

This way, by (\uparrow^{\leq}) , $\Theta' \vdash [\sigma]N \leq [\sigma]K$, as required.

Case 4. $M_1 = Q_1 \rightarrow M_1'$. Then as noted above, $[\sigma]M_1 = [\sigma]M_2$ means that $M_2 = Q_2 \rightarrow M_2'$, $[\sigma]Q_1 = [\sigma]Q_2$, and $[\sigma]M_1' = [\sigma]M_2'$. Moreover, $\Theta \vdash N \leqslant Q_1 \rightarrow M_1'$ can only be inferred by $(\rightarrow^{\leqslant})$, and thus, $N = P \rightarrow N'$, and by inversion, $\Theta \vdash P \geqslant Q_1$ and $\Theta \vdash N' \leqslant M_1'$. Analogously, $\Theta \vdash Q_2 \rightarrow M_2' \leqslant K$ means that $K = R \rightarrow K'$, $\Theta \vdash Q_2 \geqslant R$, and $\Theta \vdash M_2' \leqslant K'$.

Notice that the derivations of $\Theta \vdash P \geqslant Q_1$ and $\Theta \vdash N' \leqslant M'_1$ are proper sub-derivations of $\Theta \vdash P \rightarrow N' \leqslant Q_1 \rightarrow M'_1$, and the derivations of $\Theta \vdash Q_2 \geqslant R$ and $\Theta \vdash M'_2 \leqslant K'$ are proper sub-derivations of $\Theta \vdash Q_2 \rightarrow M'_2 \leqslant R \rightarrow K'$. This way, the induction hypothesis is applicable:

- applying the induction hypothesis to $\Theta \vdash P \geqslant Q_1$ and $\Theta \vdash Q_2 \geqslant R$ with $\Theta' \vdash \sigma : \Theta$ unifying Q_1 and Q_2 , we obtain $\Theta' \vdash [\sigma]P \geqslant [\sigma]R$;
- applying the induction hypothesis to $\Theta \vdash N' \leq M_1'$ and $\Theta \vdash M_2' \leq K'$ with $\Theta' \vdash \sigma : \Theta$ unifying M_1' and M_2' , we obtain $\Theta' \vdash [\sigma]N' \leq [\sigma]K'$.

This way, by (\to^{\leq}) , $\Theta' \vdash [\sigma]P \to [\sigma]N' \leq [\sigma]R \to [\sigma]K'$, that is $\Theta' \vdash [\sigma]N \leq [\sigma]K$, as required.

After that, we consider all the analogous positive cases and prove them symmetrically.

Corollary 10 (*Transitivity of equivalence*). Assuming the types are well-formed in Θ ,

- if $\Theta \vdash N_1 \simeq^{\leqslant} N_2$ and $\Theta \vdash N_2 \simeq^{\leqslant} N_3$ then $\Theta \vdash N_1 \simeq^{\leqslant} N_3$,
- + if $\Theta \vdash P_1 \simeq^{\leqslant} P_2$ and $\Theta \vdash P_2 \simeq^{\leqslant} P_3$ then $\Theta \vdash P_1 \simeq^{\leqslant} P_3$.

3476

3478 3479 **Lemma 25** (*Declarative Equivalence is invariant under bijections*). Suppose μ is a bijection μ : $vars_1 \leftrightarrow vars_2$, then

- + $P_1 \simeq^D P_2$ implies $[\mu]P_1 \simeq^D [\mu]P_2$, and there exists an inference tree of $[\mu]P_1 \simeq^D [\mu]P_2$ with the same shape as the one inferring $P_1 \simeq^D P_2$;
- $-N_1 \simeq^D N_2$ implies $[\mu]N_1 \simeq^D [\mu]N_2$, and there exists an inference tree of $[\mu]N_1 \simeq^D [\mu]N_2$ with the same shape as the one inferring $N_1 \simeq^D N_2$.

Proof. We prove it by induction on $P_1 \simeq^D P_2$ and mutually, on $N_1 \simeq^D N_2$. Let us consider the last rule used in the derivation.

Case 1. (\forall^{\simeq^D})

Then we decompose N_1 as $\forall \overrightarrow{\alpha^+}_1$. M_1 and N_2 as $\forall \overrightarrow{\alpha^+}_2$. M_2 , where M_1 and M_2 do not start with \forall -quantifiers. where $|\overrightarrow{\alpha^+}_1| + |\overrightarrow{\alpha^+}_2| > 0$. By convention, let us assume that $\overrightarrow{\alpha^+}_1$ and $\overrightarrow{\alpha^+}_2$ are disjoint form $vars_2$ and $vars_1$.

By inversion, $\overrightarrow{\alpha^+}_1 \cap \text{fv } M_2 = \emptyset$ and $M_1 \simeq^D [\mu'] M_2$ for some bijection $\mu' : (\overrightarrow{\alpha^+}_2 \cap \text{fv } M_2) \leftrightarrow (\overrightarrow{\alpha^+}_1 \cap \text{fv } M_1)$. Then let us apply the induction hypothesis to $M_1 \simeq^D [\mu'] M_2$ to obtain $[\mu] M_1 \simeq^D [\mu] [\mu'] M_2$ inferred by the tree of the same shape as $M_1 \simeq^D [\mu'] M_2$.

Notice that $[\mu]M_1$ and $[\mu]M_2$ do not start with \forall , That is $[\mu]\forall \overrightarrow{\alpha^+}_1.M_1 \simeq^D [\mu]\forall \overrightarrow{\alpha^+}_2.M_2$, rewritten as $\forall \overrightarrow{\alpha^+}_1.[\mu]M_1 \simeq^D \forall \overrightarrow{\alpha^+}_2.[\mu]M_2$, can be inferred by (\forall^{\simeq^D}) :

- (1) $\overrightarrow{\alpha}_1^+$ is disjoint from $vars_2 \cup fv M_2 \subseteq fv [\mu] M_2$;
- (2) $[\mu]M_1 \simeq^D [\mu'][\mu]M_2$ because $[\mu'][\mu]M_2 = [\mu][\mu']M_2$ (by Corollary 4: $\mu' : (\overrightarrow{\alpha^+}_2 \cap \text{fv } M_2) \leftrightarrow (\overrightarrow{\alpha^+}_1 \cap \text{fv } M_1), \mu : vars_1 \leftrightarrow vars_2, vars_1 \text{ is disjoint from } \overrightarrow{\alpha^+}_2 \text{ and } \overrightarrow{\alpha^+}_1; \overrightarrow{\alpha^+}_2 \text{ is disjoint from } vars_1 \text{ and } vars_2)$

Notice that it is the same rule as the one inferring $N_1 \simeq^D N_2$, and thus, the shapes of the trees are the same.

Case 2. $(VAR_{-}^{\simeq D})$

Then $N_1 = N_2 = \alpha^-$, and the required $[\mu]\alpha^- = [\mu]\alpha^-$ is also inferred by $(VAR_-^{\sim D})$, since $[\mu]\alpha^-$ is a variable.

Case 3. (\rightarrow^{\simeq^D})

Then we are proving that $P_1 \to M_1 \simeq^D P_2 \to M_2$ implies $[\mu](P_1 \to M_1) \simeq^D [\mu](P_2 \to M_2)$ (preserving the tree structure).

By inversion, we have $P_1 \simeq^D P_2$ and $M_1 \simeq^D M_2$, and thus, by the induction hypothesis, $[\mu]P_1 \simeq^D [\mu]P_2$ and $[\mu]M_1 \simeq^D [\mu]M_2$. Then $[\mu](P_1 \to M_1) \simeq^D [\mu](P_2 \to M_2)$, or in other words, $[\mu]P_1 \to [\mu]M_1 \simeq^D [\mu]P_2 \to [\mu]M_2$, is inferred by the same rule– (\to^{\simeq^D}) .

Case 4. (\uparrow^{\simeq^D}) This case is done by similar congruent arguments as the previous one.

Case 5. The positive cases are proved symmetrically.

Lemma 26. The set of free variables is invariant under equivalence.

- If $N \simeq^D M$ then fy N = fy M (as sets)
- + If $P \simeq^D Q$ then fv P = fv Q (as sets)

3523

3524 3525 3526

3527 3528 **Proof.** Mutual induction on $N \simeq^D M$ and $P \simeq^D Q$ The base cases (($VAR_-^{\cong D}$) and ($VAR_+^{\cong D}$)) are trivial. So are ($\uparrow^{\cong D}$), ($\downarrow^{\cong D}$), and ($\rightarrow^{\cong D}$), where the required property follows from the induction hypothesis.

Let us consider the case when the equivalence is formed by (\forall^{\simeq^D}) , that is the equivalence has a shape $\forall \overrightarrow{\alpha^+}$. $N \simeq^D \forall \overrightarrow{\beta^+}$. M, and by inversion, there is a bijection $\mu: (\overrightarrow{\beta^+} \cap \text{fv } M) \leftrightarrow (\overrightarrow{\alpha^+} \cap \text{fv } N)$ such that $N \simeq^D [\mu]M$, which by the induction hypothesis means $\text{fv } N = \text{fv } [\mu]M = [\mu]\text{fv } M$.

Let us ensure by alpha-equivalence that $\overrightarrow{\alpha^+}$ is disjoint from $f \lor M$. Then $(f \lor \overrightarrow{\beta^+}, M) \lor \overrightarrow{\alpha^+} = f \lor \lor \overrightarrow{\beta^+}$. M. Then we apply the following chain of equalities: $f \lor \lor \overrightarrow{\alpha^+}$. $N = f \lor N \lor \overrightarrow{\alpha^+} = ([\mu] f \lor M) \lor \overrightarrow{\alpha^+} = [\mu] (f \lor \lor \overrightarrow{\beta^+}, M \cup (\overrightarrow{\beta^+} \cap f \lor M)) \lor \overrightarrow{\alpha^+} = ([\mu] f \lor \lor \overrightarrow{\beta^+}, M) \lor \overrightarrow{\alpha^+} = (f \lor \lor \overrightarrow{\beta^+}, M) \lor \overrightarrow{\alpha^+} = f \lor \lor \overrightarrow{\beta^+}, M$.

Symmetrically, we prove the case when the equivalence is formed by (\exists^{\simeq^D}) .

Lemma 27 (Declarative equivalence is transitive).

- + if $P_1 \simeq^D P_2$ and $P_2 \simeq^D P_3$ then $P_1 \simeq^D P_3$,
- if $N_1 \simeq^D N_2$ and $N_2 \simeq^D N_3$ then $N_1 \simeq^D N_3$.

Proof. We prove it by $\operatorname{size}(P_1 \simeq^D P_2) + \operatorname{size}(P_2 \simeq^D P_3)$ and mutually, $\operatorname{size}(N_1 \simeq^D N_2) + \operatorname{size}(N_2 \simeq^D N_3)$, where by size, we mean the size of the nodes in the corresponding inference tree.

Case 1. First, let us consider the case when either $N_1 \cong^D N_2$ or $N_2 \cong^D N_3$ is inferred by (\forall^{\cong^D}) . Let us decompose N_1 , N_2 , and N_3 as follows: $N_1 = \forall \overrightarrow{\alpha^+}_1$. M_1 , $N_2 = \forall \overrightarrow{\alpha^+}_2$. M_2 , and $N_3 = \forall \overrightarrow{\alpha^+}_3$. M_3 .

Then by inversion of $\forall \overrightarrow{\alpha^+}_1$. $M_1 \simeq^D \forall \overrightarrow{\alpha^+}_2$. M_2 (or if $\overrightarrow{\alpha^+}_1$ and $\overrightarrow{\alpha^+}_2$ are both empty, by assumption):

(1)
$$\overrightarrow{\alpha}^+_1 \cap \text{fv } M_2 = \emptyset \text{ and }$$

, Vol. 1, No. 1, Article . Publication date: July 2024.

(2) there exists a bijection on variables $\mu_1: (\overrightarrow{\alpha^+}_2 \cap \text{fv } M_2) \leftrightarrow (\overrightarrow{\alpha^+}_1 \cap \text{fv } M_1)$ such that $M_1 \simeq^D [\mu_1] M_2$.

Analogously, $\forall \overrightarrow{\alpha^+}_1$. $M_1 \simeq^D \forall \overrightarrow{\alpha^+}_2$. M_2 implies:

(1) $\overrightarrow{\alpha}^+_2 \cap \text{fv } M_3 = \emptyset \text{ and }$

3529

3530 3531

3532

3534

3536

3538

3556

3564 3565

3566

3567 3568

3569 3570

3571 3572

3573

3574 3575

3576 3577 (2) $M_2 \simeq^D [\mu_2] M_3$ for some bijection $\mu_2 : (\overrightarrow{\alpha^+}_3 \cap \text{fv } M_3) \leftrightarrow (\overrightarrow{\alpha^+}_2 \cap \text{fv } M_2)$.

Notice that either $M_1 \simeq^D [\mu_1] M_2$ is inferred by a proper sub-tree of $\forall \overrightarrow{\alpha^+}_1. M_1 \simeq^D \forall \overrightarrow{\alpha^+}_2. M_2$ or $M_2 \simeq^D [\mu_2] M_3$ is inferred by a proper sub-tree of $\forall \overrightarrow{\alpha^+}_2. M_2 \simeq^D \forall \overrightarrow{\alpha^+}_3. M_3$.

Then by Lemma 25, $[\mu_1]M_2 \simeq^D [\mu_1 \circ \mu_2]M_3$ and moreover, size($[\mu_1]M_2 \simeq^D [\mu_1 \circ \mu_2]M_3$) = size($M_2 \simeq^D [\mu_2]M_3$).

Since at least one of the trees inferring $M_1 \simeq^D [\mu_1] M_2$ and $M_2 \simeq^D [\mu_2] M_3$ is a proper sub-tree of the corresponding original tree, $\operatorname{size}(M_1 \simeq^D [\mu_1] M_2) + \operatorname{size}(M_2 \simeq^D [\mu_2] M_3) < \operatorname{size}(\forall \overrightarrow{\alpha^+}_1. M_1 \simeq^D \forall \overrightarrow{\alpha^+}_2. M_2) + \operatorname{size}(\forall \overrightarrow{\alpha^+}_2. M_2 \simeq^D \forall \overrightarrow{\alpha^+}_3. M_3)$, i.e., the induction hypothesis is applicable.

By the induction hypothesis, $M_1 \simeq^D [\mu_1 \circ \mu_2] M_3$. Where $\mu_1 \circ \mu_2$ is a bijection on variables $\mu_1 \circ \mu_2 : (\overrightarrow{\alpha^+}_3 \cap \text{fv } M_3) \leftrightarrow (\overrightarrow{\alpha^+}_1 \cap \text{fv } M_1)$. Then $\forall \overrightarrow{\alpha^+}_1 . M_1 \simeq^D \forall \overrightarrow{\alpha^+}_3 . M_3$ by (\forall^{\simeq^D}) .

Once this case has been considered, we can assume that neither $N_1 \simeq^D N_2$ nor $N_2 \simeq^D N_3$ is inferred by (\forall^{\simeq^D}) .

- **Case 2.** $N_1 \simeq^D N_2$ is inferred by $(VAR_-^{\cong D})$ Then $N_1 = N_2 = \alpha^-$, and thus, $N_1 \simeq^D N_3$ holds since $N_2 \simeq^D N_3$.
- Case 3. $N_1 \simeq^D N_2$ is inferred by (\rightarrow^{\simeq^D}) Then $N_1 = P_1 \to M_1$ and $N_2 = P_2 \to M_2$, and by inversion, $P_1 \simeq^D P_2$ and $M_1 \simeq^D M_2$.

Moreover, since N_3 does not start with \forall , $N_2 \simeq^D N_3$ is also inferred by (\rightarrow^{\simeq^D}) , which means that $N_3 = P_3 \to M_3$, $P_2 \simeq^D P_3$, and $M_2 \simeq^D M_3$.

Then by the induction hypothesis, $P_1 \simeq^D P_3$ and $M_1 \simeq^D M_3$, and thus, $P_1 \to M_1 \simeq^D P_3 \to M_3$ by (\to^{\simeq^D}) .

- **Case 4**. $N_1 \simeq^D N_2$ is inferred by (\rightarrow^{\sim^D}) For this case, the reasoning is the same as for the previous one.
- Case 5. The positive cases are proved symmetrically.

Lemma 28 (*Type well-formedness is invariant under equivalence*). Mutual subtyping implies declarative equivalence.

3622

3623 3624

3625 3626 **Proof.** We prove it by induction on $P \simeq^D Q$ and mutually, on $N \simeq^D M$. Let us consider the last rule used in the derivation.

Case 1. (VAR $^{\simeq D}$), that is $N \simeq^D M$ has shape $\alpha^- \simeq^D \alpha^-$. Than $\Theta \vdash P \iff \Theta \vdash Q$ is rewritten as $\Theta \vdash \alpha^- \iff \Theta \vdash \alpha^-$, which holds trivially.

Case 2. (\uparrow^{\simeq^D}) , that is $N \simeq^D M$ has shape $\uparrow P \simeq^D \uparrow Q$. By inversion, $P \simeq^D Q$, and by the induction hypothesis, $\Theta \vdash P \iff \Theta \vdash Q$. Also notice that $\Theta \vdash \uparrow P \iff \Theta \vdash P$ and $\Theta \vdash \uparrow Q \iff \Theta \vdash Q$ by inversion and (\uparrow^{WF}) . This way, $\Theta \vdash \uparrow P \iff \Theta \vdash P \iff \Theta \vdash Q \iff \Theta \vdash \uparrow Q$.

Case 3. (\to^{\simeq^D}) , that is $N \simeq^D M$ has shape $P \to N' \simeq^D Q \to M'$. Then by inversion, $P \simeq^D Q$ and $N' \simeq^D M'$, and by the induction hypothesis, $\Theta \vdash P \iff \Theta \vdash Q$ and $\Theta \vdash N' \iff \Theta \vdash M'$.

$$\Theta \vdash P \to N' \iff \Theta \vdash P \text{ and } \Theta \vdash N'$$
 by inversion and (\to^{WF})

$$\iff \Theta \vdash Q \text{ and } \Theta \vdash M'$$
 as noted above
$$\iff \Theta \vdash Q \to M'$$
 by (\to^{WF}) and inversion

Case 4. (\forall^{\cong^D}) , that is $N \simeq^D M$ has shape $\forall \overrightarrow{\alpha^+}, N' \simeq^D \forall \overrightarrow{\beta^+}, M'$. By inversion, $\forall \overrightarrow{\alpha^+}, N' \simeq^D \forall \overrightarrow{\beta^+}, M'$ means that $\overrightarrow{\alpha^+} \cap \text{fv } M = \emptyset$ and that there exists a bijection on variables $\mu : (\overrightarrow{\beta^+} \cap \text{fv } M') \leftrightarrow (\overrightarrow{\alpha^+} \cap \text{fv } N')$ such that $N' \simeq^D [\mu]M'$.

By inversion and (\forall^{WF}) , $\Theta \vdash \forall \overrightarrow{\alpha^+}$. N' is equivalent to Θ , $\overrightarrow{\alpha^+} \vdash N'$, and by Lemma 4, it is equivalent to Θ , $(\overrightarrow{\alpha^+} \cap \text{fv } N') \vdash N'$, which, by the induction hypothesis, is equivalent to Θ , $(\overrightarrow{\alpha^+} \cap \text{fv } N') \vdash [\mu]M'$.

Analogously, $\Theta \vdash \forall \overrightarrow{\beta^+}$. M' is equivalent to Θ , $(\overrightarrow{\beta^+} \cap \text{fv } M') \vdash M'$. By Lemma 5, it implies Θ , $(\overrightarrow{\alpha^+} \cap \text{fv } M') \vdash [\mu]M'$ implies Θ , $(\overrightarrow{\beta^+} \cap \text{fv } M') \vdash [\mu]M'$ implies Θ , $(\overrightarrow{\beta^+} \cap \text{fv } M') \vdash [\mu]M'$.

This way, both $\Theta \vdash \forall \overrightarrow{\alpha^+}$. N' and $\Theta \vdash \forall \overrightarrow{\beta^+}$. M' are equivalent to Θ , $(\overrightarrow{\alpha^+} \cap \text{fv } N') \vdash [\mu]M'$.

Case 5. For the cases of the positive types, the proofs are symmetric.

Lemma 29 (Soundness of equivalence). Declarative equivalence implies mutual subtyping.

```
+ if \Theta \vdash P, \Theta \vdash Q, and P \simeq^D Q then \Theta \vdash P \simeq^{\leq} Q,
```

- if
$$\Theta \vdash N$$
, $\Theta \vdash M$, and $N \simeq^D M$ then $\Theta \vdash N \simeq^{\leq} M$.

Proof. We prove it by mutual induction on $P \simeq^D Q$ and $N \simeq^D M$.

3666 3667

3668 3669

3670 3671

3672

3673

3674 3675 Then $\Theta \vdash \alpha^- \leq \alpha^-$ by (VAR $^{\leq}$), which immediately implies $\Theta \vdash \alpha^- \simeq^{\leq} \alpha^-$ by (\simeq^{\leq}_-).

Case 2. $\uparrow P \simeq^D \uparrow Q$

Then by inversion of (\uparrow^{\leq}) , $P \simeq^D Q$, and from the induction hypothesis, $\Theta \vdash P \simeq^{\leq} Q$, and (by symmetry) $\Theta \vdash Q \simeq^{\leq} P$.

When (\uparrow^{\leq}) is applied to $\Theta \vdash P \cong^{\leq} Q$, it gives us $\Theta \vdash \uparrow P \leq \uparrow Q$; when it is applied to $\Theta \vdash Q \cong^{\leq} P$, we obtain $\Theta \vdash \uparrow Q \leq \uparrow P$. Together, it implies $\Theta \vdash \uparrow P \cong^{\leq} \uparrow Q$.

Case 3. $P \rightarrow N \simeq^D O \rightarrow M$

Then by inversion of (\to^{\leqslant}) , $P \simeq^D Q$ and $N \simeq^D M$. By the induction hypothesis, $\Theta \vdash P \simeq^{\leqslant} Q$ and $\Theta \vdash N \simeq^{\leqslant} M$, which means by inversion: (i) $\Theta \vdash P \geqslant Q$, (ii) $\Theta \vdash Q \geqslant P$, (iii) $\Theta \vdash N \leqslant M$, (iv) $\Theta \vdash M \leqslant N$. Applying (\to^{\leqslant}) to (i) and (iii), we obtain $\Theta \vdash P \to N \leqslant Q \to M$; applying it to (ii) and (iv), we have $\Theta \vdash Q \to M \leqslant P \to N$. Together, it implies $\Theta \vdash P \to N \simeq^{\leqslant} Q \to M$.

Case 4. $\forall \overrightarrow{\alpha^+}$. $N \simeq^D \forall \overrightarrow{\beta^+}$. M

Then by inversion, there exists bijection $\mu: (\overrightarrow{\beta^+} \cap \text{fv } M) \leftrightarrow (\overrightarrow{\alpha^+} \cap \text{fv } N)$, such that $N \simeq^D [\mu]M$. By the induction hypothesis, $\Theta, \overrightarrow{\alpha^+} \vdash N \simeq^{<} [\mu]M$. From Corollary 9 and the fact that μ is bijective, we also have $\Theta, \overrightarrow{\beta^+} \vdash [\mu^{-1}]N \simeq^{<} M$.

Let us construct a substitution $\overrightarrow{\alpha^+} \vdash \overrightarrow{P}/\overrightarrow{\beta^+} : \overrightarrow{\beta^+}$ by extending μ with arbitrary positive types on $\overrightarrow{\beta^+} \setminus \text{fv } M$.

Notice that $[\mu]M = [\overrightarrow{P}/\overrightarrow{\beta^+}]M$, and therefore, $\Theta, \overrightarrow{\alpha^+} \vdash N \simeq^{\leq} [\mu]M$ implies $\Theta, \overrightarrow{\alpha^+} \vdash [\overrightarrow{P}/\overrightarrow{\beta^+}]M \leq N$. Then by $(\forall^{\leq}), \Theta \vdash \forall \overrightarrow{\beta^+}, M \leq \forall \overrightarrow{\alpha^+}, N$.

Analogously, we construct the substitution from μ^{-1} , and use it to instantiate $\overrightarrow{\alpha^+}$ in the application of (\forall^{\leq}) to infer $\Theta \vdash \forall \overrightarrow{\alpha^+}$. $N \leq \forall \overrightarrow{\beta^+}$. M.

This way, $\Theta \vdash \forall \overrightarrow{\beta^+}. M \leqslant \forall \overrightarrow{\alpha^+}. N \text{ and } \Theta \vdash \forall \overrightarrow{\alpha^+}. N \leqslant \forall \overrightarrow{\beta^+}. M \text{ gives us } \Theta \vdash \forall \overrightarrow{\beta^+}. M \simeq^{\leqslant} \forall \overrightarrow{\alpha^+}. N.$

Case 5. For the cases of the positive types, the proofs are symmetric.

Lemma 30 (Subtyping induced by disjoint substitutions). Suppose that $\Theta \vdash \sigma_1 : \Theta_1$ and $\Theta \vdash \sigma_2 : \Theta_1$, where $\Theta_i \subseteq \Theta$ and $\Theta_1 \cap \Theta_2 = \emptyset$. Then

- assuming Θ ⊢ N, Θ ⊢ $[\sigma_1]N \le [\sigma_2]N$ implies Θ ⊢ $\sigma_i \simeq^{\le}$ id : fv N
- + assuming $\Theta \vdash P$, $\Theta \vdash [\sigma_1]P \geqslant [\sigma_2]P$ implies $\Theta \vdash \sigma_i \simeq^{\leqslant} id : f \lor P$

Proof. Proof by induciton on $\Theta \vdash N$ (and mutually on $\Theta \vdash P$).

Case 1. $N = \alpha^-$

Then $\Theta \vdash [\sigma_1]N \leq [\sigma_2]N$ is rewritten as $\Theta \vdash [\sigma_1]\alpha^- \leq [\sigma_2]\alpha^-$. Let us consider the following cases:

, Vol. 1, No. 1, Article . Publication date: July 2024.

a. $\alpha^- \notin \Theta_1$ and $\alpha^- \notin \Theta_2$ Then $\Theta \vdash \sigma_i \simeq^{\leqslant} \mathrm{id} : \alpha^-$ holds immediately, since $[\sigma_i]\alpha^- = [\mathrm{id}]\alpha^- = \alpha^-$ and $\Theta \vdash \alpha^- \simeq^{\leqslant} \alpha^-$.

b. $\alpha^- \in \Theta_1$ and $\alpha^- \in \Theta_2$

 This case is not possible by assumption: $\Theta_1 \cap \Theta_2 = \emptyset$.

c. $\alpha^- \in \Theta_1$ and $\alpha^- \notin \Theta_2$ Then we have $\Theta \vdash [\sigma_1]\alpha^- \leq \alpha^-$, which by Corollary 8 means $\Theta \vdash [\sigma_1]\alpha^- \simeq^{\leq} \alpha^-$, and hence, $\Theta \vdash \sigma_1 \simeq^{\leq} \operatorname{id} : \alpha^-$.

 $\Theta \vdash \sigma_2 \simeq^{\leq} id : \alpha^- \text{ holds since } [\sigma_2] \alpha^- = \alpha^-, \text{ similarly to case } 1.a.$

d. $\alpha^- \notin \Theta_1$ and $\alpha^- \in \Theta_2$ Then we have $\Theta \vdash \alpha^- \leqslant [\sigma_2]\alpha^-$, which by Corollary 8 means $\Theta \vdash \alpha^- \simeq^{\leqslant} [\sigma_2]\alpha^-$, and hence, $\Theta \vdash \sigma_2 \simeq^{\leqslant} \mathrm{id} : \alpha^-$.

 $\Theta \vdash \sigma_1 \simeq^{\leq} id : \alpha^- \text{ holds since } [\sigma_1] \alpha^- = \alpha^-, \text{ similarly to case } 1.a.$

Case 2. $N = \forall \overrightarrow{\alpha^+}$. M

Then by inversion, Θ , $\overrightarrow{\alpha^{+}} \vdash M$. $\Theta \vdash [\sigma_{1}]N \leq [\sigma_{2}]N$ is rewritten as $\Theta \vdash [\sigma_{1}]\forall \overrightarrow{\alpha^{+}}$. $M \leq [\sigma_{2}]\forall \overrightarrow{\alpha^{+}}$. M. By the congruence of substitution and by the inversion of (\forall^{\leq}) , Θ , $\overrightarrow{\alpha^{+}} \vdash [\overrightarrow{Q}/\overrightarrow{\alpha^{+}}][\sigma_{1}]M \leq [\sigma_{2}]M$, where Θ , $\overrightarrow{\alpha^{+}} \vdash Q_{i}$. Let us denote the (Kleisli) composition of σ_{1} and $\overrightarrow{Q}/\overrightarrow{\alpha^{+}}$ as σ'_{1} , noting that Θ , $\overrightarrow{\alpha^{+}} \vdash \sigma'_{1} : \Theta_{1}$, $\overrightarrow{\alpha^{+}}$, and $(\Theta_{1}, \overrightarrow{\alpha^{+}}) \cap \Theta_{2} = \emptyset$.

Let us apply the induction hypothesis to M and the substitutions σ'_1 and σ_2 with Θ , $\overrightarrow{\alpha^+} \vdash [\sigma'_1]M \leq [\sigma_2]M$ to obtain:

$$\Theta, \overrightarrow{\alpha^{+}} \vdash \sigma'_{1} \simeq^{\leqslant} id : fv M$$
 (1)

$$\Theta, \overrightarrow{\alpha^+} \vdash \sigma_2 \simeq^{\leq} id : fv M$$
 (2)

Then $\Theta \vdash \sigma_2 \cong^{<} \text{id} : \text{fv} \forall \overrightarrow{\alpha^+}. M \text{ holds by strengthening of 2: for any } \beta^{\pm} \in \text{fv} \forall \overrightarrow{\alpha^+}. M = \text{fv} M \setminus \overrightarrow{\alpha^+}, \Theta, \overrightarrow{\alpha^+} \vdash [\sigma_2] \beta^{\pm} \cong^{<} \beta^{\pm} \text{ is strengthened to } \Theta \vdash [\sigma_2] \beta^{\pm} \cong^{<} \beta^{\pm}, \text{ because fv} [\sigma_2] \beta^{\pm} = \text{fv} \beta^{\pm} \in \Theta.$

To show that $\Theta \vdash \sigma_1 \simeq^{\leq} id : f \lor \forall \alpha^{\leftarrow} M$, let us take an arbitrary $\beta^{\pm} \in f \lor \forall \alpha^{\leftarrow} M \setminus \alpha^{\leftarrow} M$.

$$\begin{split} \beta^{\pm} &= [\operatorname{id}]\beta^{\pm} & \text{by definition of id} \\ &\simeq^{\leqslant} [\sigma_1']\beta^{\pm} & \text{by 1} \\ &= [\overrightarrow{Q}/\overrightarrow{\alpha^{+}}][\sigma_1]\beta^{\pm} & \text{by definition of } \sigma_1' \\ &= [\sigma_1]\beta^{\pm} & \text{because } \overrightarrow{\alpha^{+}} \cap \text{fv } [\sigma_1]\beta^{\pm} \subseteq \overrightarrow{\alpha^{+}} \cap \Theta = \emptyset \end{split}$$

This way, $\Theta \vdash [\sigma_1]\beta^{\pm} \simeq^{\leqslant} \beta^{\pm}$ for any $\beta^{\pm} \in \mathsf{fv} \,\forall \overrightarrow{\alpha^+} \,.\, M$ and thus, $\Theta \vdash \sigma_1 \simeq^{\leqslant} \mathsf{id} : \mathsf{fv} \,\forall \overrightarrow{\alpha^+} \,.\, M$.

Case 3. $N = P \rightarrow M$

Then by inversion, $\Theta \vdash P$ and $\Theta \vdash M$. $\Theta \vdash [\sigma_1]N \leq [\sigma_2]N$ is rewritten as $\Theta \vdash [\sigma_1](P \to P)$

M) $\leq [\sigma_2](P \to M)$, then by congruence of substitution, $\Theta \vdash [\sigma_1]P \to [\sigma_1]M \leq [\sigma_2]P \to [\sigma_2]M$, then by inversion $\Theta \vdash [\sigma_1]P \geq [\sigma_2]P$ and $\Theta \vdash [\sigma_1]M \leq [\sigma_2]M$.

Applying the induction hypothesis to $\Theta \vdash [\sigma_1]P \ge [\sigma_2]P$ and to $\Theta \vdash [\sigma_1]M \le [\sigma_2]M$, we obtain (respectively):

$$\Theta \vdash \sigma_i \simeq^{\leqslant} \mathsf{id} : \mathsf{fv} \, \underline{P} \tag{3}$$

$$\Theta \vdash \sigma_i \simeq^{\leqslant} \mathsf{id} : \mathsf{fv} M \tag{4}$$

Noting that $fv(P \to M) = fvP \cup fvM$, we combine Eqs. (3) and (4) to conclude: $\Theta \vdash \sigma_i \simeq^{\leq} id : fv(P \to M)$.

Case 4. $N = \uparrow P$

 Then by inversion, $\Theta \vdash P$. $\Theta \vdash [\sigma_1]N \leq [\sigma_2]N$ is rewritten as $\Theta \vdash [\sigma_1] \uparrow P \leq [\sigma_2] \uparrow P$, then by congruence of substitution and by inversion, $\Theta \vdash [\sigma_1]P \geq [\sigma_2]P$

Applying the induction hypothesis to $\Theta \vdash [\sigma_1]P \geqslant [\sigma_2]P$, we obtain $\Theta \vdash \sigma_i \simeq^{\leqslant} id : f \lor P$. Since $f \lor \uparrow P = f \lor P$, we can conclude: $\Theta \vdash \sigma_i \simeq^{\leqslant} id : f \lor \uparrow P$.

Case 5. The positive cases are proved symmetrically.

Corollary 11 (Substitution cannot induce proper subtypes or supertypes). Assuming all mentioned types are well-formed in Θ and σ is a substitution $\Theta \vdash \sigma : \Theta$,

```
\begin{split} \Theta &\vdash [\sigma] N \leqslant N \implies \Theta \vdash [\sigma] N \simeq^{\varsigma} N \text{ and } \Theta \vdash \sigma \simeq^{\varsigma} \text{ id : fv } N \\ \Theta &\vdash N \leqslant [\sigma] N \implies \Theta \vdash N \simeq^{\varsigma} [\sigma] N \text{ and } \Theta \vdash \sigma \simeq^{\varsigma} \text{ id : fv } N \\ \Theta &\vdash [\sigma] P \geqslant P \implies \Theta \vdash [\sigma] P \simeq^{\varsigma} P \text{ and } \Theta \vdash \sigma \simeq^{\varsigma} \text{ id : fv } P \\ \Theta &\vdash P \geqslant [\sigma] P \implies \Theta \vdash P \simeq^{\varsigma} [\sigma] P \text{ and } \Theta \vdash \sigma \simeq^{\varsigma} \text{ id : fv } P \end{split}
```

Lemma 31 (*Mutual substitution and subtyping*). Assuming that the mentioned types (P, Q, N, and M) are well-formed in Θ and that the substitutions (σ_1 and σ_2) have signature $\Theta \vdash \sigma_i : \Theta$,

- + if $\Theta \vdash [\sigma_1]P \geqslant Q$ and $\Theta \vdash [\sigma_2]Q \geqslant P$ then there exists a bijection $\mu : \text{fv } P \leftrightarrow \text{fv } Q$ such that $\Theta \vdash \sigma_1 \simeq^{\leqslant} \mu : \text{fv } P$ and $\Theta \vdash \sigma_2 \simeq^{\leqslant} \mu^{-1} : \text{fv } Q$;
- if Θ ⊢ $[\sigma_1]N \le M$ and Θ ⊢ $[\sigma_2]N \le M$ then there exists a bijection μ : fv $N \leftrightarrow$ fv M such that Θ ⊢ $\sigma_1 \simeq^{\leqslant} \mu$: fv N and Θ ⊢ $\sigma_2 \simeq^{\leqslant} \mu^{-1}$: fv M.

Proof.

+ Applying σ_2 to both sides of $\Theta \vdash [\sigma_1]P \geqslant Q$ (by Lemma 23), we have: $\Theta \vdash [\sigma_2 \circ \sigma_1]P \geqslant [\sigma_2]Q$. Composing it with $\Theta \vdash [\sigma_2]Q \geqslant P$ by transitivity (Lemma 24), we have $\Theta \vdash [\sigma_2 \circ \sigma_1]P \geqslant P$. Then by Corollary 11, $\Theta \vdash \sigma_2 \circ \sigma_1 \simeq^{\epsilon}$ id : fv P. By a symmetric argument, we also have: $\Theta \vdash \sigma_1 \circ \sigma_2 \simeq^{\epsilon}$ id : fv Q.

Now, we prove that $\Theta \vdash \sigma_2 \circ \sigma_1 \simeq^{\epsilon} id : fv P \text{ and } \Theta \vdash \sigma_1 \circ \sigma_2 \simeq^{\epsilon} id : fv Q \text{ implies that } \sigma_1 \text{ and } \sigma_1 \text{ are (equivalent to) mutually inverse bijections.}$

To do so, it suffices to prove that

- (i) for any $\alpha^{\pm} \in \text{fv } P$ there exists $\beta^{\pm} \in \text{fv } Q$ such that $\Theta \vdash [\sigma_1] \alpha^{\pm} \simeq^{\leqslant} \beta^{\pm}$ and $\Theta \vdash [\sigma_2] \beta^{\pm} \simeq^{\leqslant} \alpha^{\pm}$; and
- (ii) for any $\beta^{\pm} \in \text{fv } Q$ there exists $\alpha^{\pm} \in \text{fv } P$ such that $\Theta \vdash [\sigma_2]\beta^{\pm} \simeq^{\leqslant} \alpha^{\pm}$ and $\Theta \vdash [\sigma_1]\alpha^{\pm} \simeq^{\leqslant} \beta^{\pm}$.

Then these correspondences between fv P and fv Q are mutually inverse functions, since for any β^{\pm} there can be at most one α^{\pm} such that $\Theta \vdash [\sigma_2]\beta^{\pm} \simeq^{\leqslant} \alpha^{\pm}$ (and vice versa).

- (i) Let us take $\alpha^{\pm} \in \text{fv } P$.
 - (a) if α^{\pm} is positive $(\alpha^{\pm} = \alpha^{+})$, from $\Theta \vdash [\sigma_{2}][\sigma_{1}]\alpha^{+} \simeq^{<} \alpha^{+}$, by Corollary 8, we have $[\sigma_{2}][\sigma_{1}]\alpha^{+} = \exists \overrightarrow{\beta}^{-}, \alpha^{+}$.

What shape can $[\sigma_1]\alpha^+$ have? It cannot be $\exists \overrightarrow{\alpha}^-$. $\downarrow N$ (for potentially empty $\overrightarrow{\alpha}^-$), because the outer constructor \downarrow would remain after the substitution σ_2 , whereas $\exists \overrightarrow{\beta}^-$. α^+ does not have \downarrow . The only case left is $[\sigma_1]\alpha^+ = \exists \overrightarrow{\alpha}^-$. γ^+ .

Notice that $\Theta \vdash \exists \overrightarrow{\alpha^{-}}. \gamma^{+} \simeq^{\leqslant} \gamma^{+}$, meaning that $\Theta \vdash [\sigma_{1}]\alpha^{+} \simeq^{\leqslant} \gamma^{+}$. Also notice that $[\sigma_{2}]\exists \overrightarrow{\alpha^{-}}. \gamma^{+} = \exists \overrightarrow{\beta^{-}}. \alpha^{+}$ implies $\Theta \vdash [\sigma_{2}]\gamma^{+} \simeq^{\leqslant} \alpha^{+}$.

(b) if α^{\pm} is negative $(\alpha^{\pm} = \alpha^{-})$ from $\Theta \vdash [\sigma_{2}][\sigma_{1}]\alpha^{-} \simeq \alpha^{-}$, by Corollary 8, we have $[\sigma_{2}][\sigma_{1}]\alpha^{-} = \forall \overrightarrow{\beta^{+}}.\alpha^{-}$.

What shape can $[\sigma_1]\alpha^-$ have? It cannot be $\forall \overrightarrow{\alpha^+}. \uparrow P$ nor $\forall \overrightarrow{\alpha^+}. P \to M$ (for potentially empty $\overrightarrow{\alpha^+}$), because the outer constructor $(\to \text{ or } \uparrow)$, remaining after the substitution σ_2 , is however absent in the resulting $\forall \overrightarrow{\beta^+}. \alpha^-$. Hence, the only case left is $[\sigma_1]\alpha^- = \forall \overrightarrow{\alpha^+}. \gamma^-$ Notice that $\Theta \vdash \gamma^- \simeq^{\leqslant} \forall \overrightarrow{\alpha^+}. \gamma^-$, meaning that $\Theta \vdash [\sigma_1]\alpha^- \simeq^{\leqslant} \gamma^-$. Also notice that $[\sigma_2]\forall \overrightarrow{\alpha^+}. \gamma^- = \forall \overrightarrow{\beta^+}. \alpha^-$ implies $\Theta \vdash [\sigma_2]\gamma^- \simeq^{\leqslant} \alpha^-$.

- (ii) The proof is symmetric: We swap P and Q, σ_1 and σ_2 , and exploit $\Theta \vdash [\sigma_1][\sigma_2]\alpha^{\pm} \simeq^{\leqslant} \alpha^{\pm}$ instead of $\Theta \vdash [\sigma_2][\sigma_1]\alpha^{\pm} \simeq^{\leqslant} \alpha^{\pm}$.
- The proof is symmetric to the positive case.

Lemma 32 (Equivalent substitution act equivalently). Suppose that $\Theta' \vdash \sigma_1 : \Theta$ and $\Theta' \vdash \sigma_2 : \Theta$ are substitutions equivalent on their domain, that is $\Theta' \vdash \sigma_1 \simeq^{\leq} \sigma_2 : \Theta$. Then

```
+ for any \Theta \vdash P, \Theta' \vdash [\sigma_1]P \simeq^{\leq} [\sigma_2]P;
```

- for any $\Theta \vdash N$, $\Theta' \vdash [\sigma_1]N \simeq^{\leq} [\sigma_2]N$.

, Vol. 1, No. 1, Article . Publication date: July 2024.

Proof. We prove it by induction on P (and mutually on N).

Case 1. $N = \alpha^-$

Then since by inversion, $\alpha^- \in \Theta$, $\Theta' \vdash [\sigma_1]\alpha^- \simeq^{\leqslant} [\sigma_2]\alpha^-$ holds by definition of $\Theta' \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \Theta$.

Case 2. $N = \uparrow P$

Then by inversion, $\Theta \vdash P$. By the induction hypothesis, $\Theta' \vdash [\sigma_1]P \simeq^{\leqslant} [\sigma_2]P$, Then by (\uparrow^{\leqslant}) , $\Theta' \vdash \uparrow [\sigma_1]P \leqslant \uparrow [\sigma_2]P$, and symmetrically, $\Theta' \vdash \uparrow [\sigma_2]P \leqslant \uparrow [\sigma_1]P$, together meaning that $\Theta' \vdash \uparrow [\sigma_1]P \simeq^{\leqslant} \uparrow [\sigma_2]P$, or equivalently, $\Theta' \vdash [\sigma_1]\uparrow P \simeq^{\leqslant} [\sigma_2]\uparrow P$.

Case 3. $N = P \rightarrow M$

Then by inversion, $\Theta \vdash P$ and $\Theta \vdash M$. By the induction hypothesis, $\Theta' \vdash [\sigma_1]P \simeq^{\leqslant} [\sigma_2]P$ and $\Theta' \vdash [\sigma_1]M \simeq^{\leqslant} [\sigma_2]M$, that is $\Theta' \vdash [\sigma_1]P \geqslant [\sigma_2]P$, $\Theta' \vdash [\sigma_2]P \geqslant [\sigma_1]P$, $\Theta' \vdash [\sigma_1]M \leqslant [\sigma_2]M$, and $\Theta' \vdash [\sigma_2]M \leqslant [\sigma_1]M$. Then by (\to^{\leqslant}) , $\Theta' \vdash [\sigma_1]P \to [\sigma_1]M \leqslant [\sigma_2]P \to [\sigma_2]M$, and again by (\to^{\leqslant}) , $\Theta' \vdash [\sigma_2]P \to [\sigma_2]M \leqslant [\sigma_1]P \to [\sigma_1]M$. This way, $\Theta' \vdash [\sigma_1]P \to [\sigma_1]M \simeq^{\leqslant} [\sigma_2]P \to [\sigma_2]M$, or equivalently, $\Theta' \vdash [\sigma_1](P \to M) \simeq^{\leqslant} [\sigma_2](P \to M)$.

Case 4. $N = \forall \overrightarrow{\alpha^+}$. M We can assume that $\overrightarrow{\alpha^+}$ is disjoint from Θ and Θ' . By inversion, $\Theta \vdash \forall \overrightarrow{\alpha^+}$. M implies $\Theta, \overrightarrow{\alpha^+} \vdash M$. Notice that $\Theta' \vdash \sigma_i : \Theta$ and $\Theta' \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \Theta$ can be extended to $\Theta', \overrightarrow{\alpha^+} \vdash \sigma_i : \Theta, \overrightarrow{\alpha^+}$ and $\Theta', \overrightarrow{\alpha^+} \vdash \sigma_1 \simeq^{\leqslant} \sigma_2 : \Theta, \overrightarrow{\alpha^+}$ by Lemma 14. Then by the induction hypothesis, $\Theta', \overrightarrow{\alpha^+} \vdash [\sigma_1]M \simeq^{\leqslant} [\sigma_2]M$, meaning by inversion that $\Theta', \overrightarrow{\alpha^+} \vdash [\sigma_1]M \leqslant [\sigma_2]M$ and $\Theta', \overrightarrow{\alpha^+} \vdash [\sigma_2]M \leqslant [\sigma_1]M$.

To infer $\Theta' \vdash \forall \overrightarrow{\alpha^+}$. $[\sigma_1]M \leq \forall \overrightarrow{\alpha^+}$. $[\sigma_2]M$, we apply (\forall^{\leq}) with the substitution Θ' , $\overrightarrow{\alpha^+} \vdash \operatorname{id} : \overrightarrow{\alpha^+}$, noting that Θ' , $\overrightarrow{\alpha^+} \vdash [\operatorname{id}][\sigma_1]M \leq [\sigma_2]M$ holds since Θ' , $\overrightarrow{\alpha^+} \vdash [\sigma_1]M \leq [\sigma_2]M$, as noted above.

Symmetrically, we infer $\Theta' \vdash \forall \overrightarrow{\alpha^+}$. $[\sigma_2]M \leqslant \forall \overrightarrow{\alpha^+}$. $[\sigma_1]M$, which together with $\Theta' \vdash \forall \overrightarrow{\alpha^+}$. $[\sigma_1]M \leqslant \forall \overrightarrow{\alpha^+}$. $[\sigma_2]M$ means $\Theta' \vdash \forall \overrightarrow{\alpha^+}$. $[\sigma_1]M \simeq^{\leqslant} \forall \overrightarrow{\alpha^+}$. $[\sigma_2]M$, or equivalently, $\Theta' \vdash [\sigma_1] \forall \overrightarrow{\alpha^+}$. $M \simeq^{\leqslant} [\sigma_2] \forall \overrightarrow{\alpha^+}$. M.

Case 5. The positive cases are proved symmetrically.

Lemma 33 (Equivalence of polymorphic types).

- For $\Theta \vdash \forall \alpha^{+}$. N and $\Theta \vdash \forall \beta^{+}$. M, if $\Theta \vdash \forall \alpha^{+}$. $N \simeq^{<} \forall \beta^{+}$. M then there exists a bijection $\mu : \beta^{+} \cap \text{fv } M \leftrightarrow \alpha^{+} \cap \text{fv } N$ such that $\Theta : \alpha^{+} \vdash N \simeq^{<} [\mu]M$.

+ For $\Theta \vdash \exists \overrightarrow{\alpha}^{-}$. P and $\Theta \vdash \exists \overrightarrow{\beta}^{-}$. Q, if $\Theta \vdash \exists \overrightarrow{\alpha}^{-}$. $P \simeq^{\leqslant} \exists \overrightarrow{\beta}^{-}$. Q then there exists a bijection $\mu : \overrightarrow{\beta}^{-} \cap \text{fv } Q \leftrightarrow \overrightarrow{\alpha}^{-} \cap \text{fv } P$ such that $\Theta, \overrightarrow{\beta}^{-} \vdash P \simeq^{\leqslant} [\mu]Q$.

Proof.

- First, by α-conversion, we ensure $\overrightarrow{\alpha^+}$ ∩ fv $M = \emptyset$ and $\overrightarrow{\beta^+}$ ∩ fv $N = \emptyset$. By inversion, Θ ⊢ $\forall \overrightarrow{\alpha^+}$. $N \simeq^{\leq} \forall \overrightarrow{\beta^+}$. M implies

(1)
$$\Theta, \overrightarrow{\beta^+} \vdash [\sigma_1]N \leqslant M \text{ for } \Theta, \overrightarrow{\beta^+} \vdash \sigma_1 : \overrightarrow{\alpha^+} \text{ and } \overrightarrow{\alpha^+}$$

(2)
$$\Theta, \overrightarrow{\alpha^+} \vdash [\sigma_2]M \leq N \text{ for } \Theta, \overrightarrow{\alpha^+} \vdash \sigma_2 : \overrightarrow{\beta^+}.$$

 To apply Lemma 31, we weaken and rearrange the contexts, and extend the substitutions to act as identity outside of their initial domain:

(1)
$$\Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash [\sigma_1] N \leq M \text{ for } \Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \sigma_1 : \Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \text{ and }$$

(2)
$$\Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash [\sigma_2]M \leq N \text{ for } \Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \sigma_2 : \Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+}.$$

Then from Lemma 31, there exists a bijection $\mu: \text{fv } M \leftrightarrow \text{fv } N \text{ such that } \Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \sigma_2 \simeq^{\leqslant} \mu: \text{fv } M \text{ and } \Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \sigma_1 \simeq^{\leqslant} \mu^{-1}: \text{fv } N.$

Let us show that $\mu|_{\overrightarrow{B^+}}$ is the appropriate candidate.

First, we show that if we restrict the domain of μ to $\overrightarrow{\beta^+}$, its range will be contained in $\overrightarrow{\alpha^+}$.

Let us take $\gamma^+ \in \overrightarrow{\beta^+} \cap \text{fv } M$ and assume $[\mu]\gamma^+ \notin \overrightarrow{\alpha^+}$. Then since $\Theta, \overrightarrow{\beta^+} \vdash \sigma_1 : \overrightarrow{\alpha^+}, \sigma_1$ acts as identity outside of $\overrightarrow{\alpha^+}$, i.e. $[\sigma_1][\mu]\gamma^+ = [\mu]\gamma^+$ (notice that γ^+ is in the domain of μ). Since $\Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \sigma_1 \simeq^{\leqslant} \mu^{-1} : \text{fv } N$, application of σ_1 to $[\mu]\gamma^+ \in \text{fv } N$ is equivalent to application of μ^{-1} , then $\Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash [\mu^{-1}][\mu]\gamma^+ \simeq^{\leqslant} [\mu]\gamma^+$, i.e. $\Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash \gamma^+ \simeq^{\leqslant} [\mu]\gamma^+$, which means $\gamma^+ \in \text{fv } [\mu]\gamma^+ \subseteq \text{fv } N$. By assumption, $\gamma^+ \in \overrightarrow{\beta^+} \cap \text{fv } M$, i.e. $\overrightarrow{\beta^+} \cap \text{fv } N \neq \emptyset$, hence contradiction.

Second, we will show $\Theta, \overrightarrow{\alpha^+} \vdash N \simeq^{\leq} [\mu|_{\overrightarrow{\beta^+}}]M$.

Since Θ , $\overrightarrow{\alpha^{+}} \vdash \sigma_{2} : \overrightarrow{\beta^{+}}$ and Θ , $\overrightarrow{\alpha^{+}}$, $\overrightarrow{\beta^{+}} \vdash \sigma_{2} \simeq^{\leqslant} \mu :$ fv M, we have Θ , $\overrightarrow{\alpha^{+}}$, $\overrightarrow{\beta^{+}} \vdash \sigma_{2} \simeq^{\leqslant} \mu|_{\overrightarrow{\beta^{+}}} :$ fv M: for any $\alpha^{\pm} \in$ fv $M \setminus \overrightarrow{\beta^{+}}$, $[\sigma_{2}]\alpha^{\pm} = \alpha^{\pm}$ since Θ , $\overrightarrow{\alpha^{+}} \vdash \sigma_{2} : \overrightarrow{\beta^{+}}$, and $[\mu|_{\overrightarrow{\beta^{+}}}]\alpha^{\pm} = \alpha^{\pm}$ by definition of substitution restriction; for $\beta^{+} \in \overrightarrow{\beta^{+}}$, $[\mu|_{\overrightarrow{\beta^{+}}}]\beta^{+} = [\mu]\beta^{+}$, and thus, Θ , $\overrightarrow{\alpha^{+}}$, $\overrightarrow{\beta^{+}} \vdash [\sigma_{2}]\beta^{+} \simeq^{\leqslant} [\mu|_{\overrightarrow{\beta^{+}}}]\beta^{+}$.

By Lemma 32, Θ , $\overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}$ $\vdash \sigma_2 \simeq^{\leqslant} \mu|_{\overrightarrow{\beta^+}}$: fv M implies Θ , $\overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}$ $\vdash [\sigma_2]M \simeq^{\leqslant} [\mu|_{\overrightarrow{\beta^+}}]M$. By similar reasoning, Θ , $\overrightarrow{\alpha^+}$, $\overrightarrow{\beta^+}$ $\vdash [\sigma_1]N \simeq^{\leqslant} [\mu^{-1}|_{\overrightarrow{\alpha^+}}]N$.

This way, by transitivity of subtyping (Lemma 24),

$$\Theta, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{+}} \vdash [\mu^{-1}|_{\overrightarrow{\alpha^{+}}}]N \leq M \tag{5}$$

$$\Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash [\mu|_{\overrightarrow{\alpha^+}}]M \leqslant N \tag{6}$$

By applying $\mu|_{\overrightarrow{\beta^{\sharp}}}$ to both sides of 5 (Lemma 23), we have $\Theta, \overrightarrow{\alpha^{+}}, \overrightarrow{\beta^{+}} \vdash [\mu|_{\overrightarrow{\beta^{\sharp}}}][\mu^{-1}|_{\overrightarrow{\alpha^{\sharp}}}]N \leq [\mu|_{\overrightarrow{\beta^{\sharp}}}]M$. By contracting $\mu^{-1}|_{\overrightarrow{\alpha^{\sharp}}} \circ \mu|_{\overrightarrow{\beta^{\sharp}}} = \mu|_{\overrightarrow{\beta^{\sharp}}}^{-1} \circ \mu|_{\overrightarrow{\beta^{\sharp}}}$ (notice that $\text{fv } N \cap \overrightarrow{\beta^{\sharp}} = \emptyset$), we have

 $\Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash N \leqslant [\mu|_{\overrightarrow{\beta^+}}]M$, which together with 6 means $\Theta, \overrightarrow{\alpha^+}, \overrightarrow{\beta^+} \vdash N \simeq^{\leqslant} [\mu|_{\overrightarrow{\beta^+}}]M$, and by strengthening, $\Theta, \overrightarrow{\alpha^+} \vdash N \simeq^{\leqslant} [\mu|_{\overrightarrow{\beta^+}}]M$.

+ The proof is symmetric to the proof of the negative case.

Lemma 34 (*Completeness of Equivalence*). Mutual subtyping implies declarative equivalence. Assuming all the types below are well-formed in Θ :

+ if $\Theta \vdash P \simeq^{\leq} Q$ then $P \simeq^{D} Q$,

3968 3969 - if $\Theta \vdash N \simeq^{\leqslant} M$ then $N \simeq^D M$.

Proof. – Induction on the sum of sizes of N and M. By inversion, $\Theta \vdash N \cong^{\leq} M$ means $\Theta \vdash N \leq M$ and $\Theta \vdash M \leq N$. Let us consider the last rule that forms $\Theta \vdash N \leq M$:

Case 1. (VAR $^{\leq}$) i.e. $\Theta \vdash N \leq M$ is of the form $\Theta \vdash \alpha^{-} \leq \alpha^{-}$ Then $N \simeq^{D} M$ (i.e. $\alpha^{-} \simeq^{D} \alpha^{-}$) holds immediately by (VAR $^{\simeq D}$).

Case 2. (\uparrow^{\leq}) i.e. $\Theta \vdash N \leq M$ is of the form $\Theta \vdash \uparrow P \leq \uparrow Q$ Then by inversion, $\Theta \vdash P \simeq^{\leq} Q$, and by induction hypothesis, $P \simeq^{D} Q$. Then $N \simeq^{D} M$ (i.e. $\uparrow P \simeq^{D} \uparrow Q$) holds by $(\uparrow^{\simeq^{D}})$.

Case 3. (\rightarrow^{\leq}) i.e. $\Theta \vdash N \leq M$ is of the form $\Theta \vdash P \to N' \leq Q \to M'$ Then by inversion, $\Theta \vdash P \geq Q$ and $\Theta \vdash N' \leq M'$. Notice that $\Theta \vdash M \leq N$ is of the form $\Theta \vdash Q \to M' \leq P \to N'$, which by inversion means $\Theta \vdash Q \geq P$ and $\Theta \vdash M' \leq N'$.

This way, $\Theta \vdash Q \simeq^{\leqslant} P$ and $\Theta \vdash M' \simeq^{\leqslant} N'$. Then by induction hypothesis, $Q \simeq^D P$ and $M' \simeq^D N'$. Then $N \simeq^D M$ (i.e. $P \to N' \simeq^D Q \to M'$) holds by (\to^{\simeq^D}) .

Case 4. (\forall^{\leq}) i.e. $\Theta \vdash N \leq M$ is of the form $\Theta \vdash \forall \overrightarrow{\alpha^{+}}. N' \leq \forall \overrightarrow{\beta^{+}}. M'$ Then by Lemma 33, $\Theta \vdash \forall \overrightarrow{\alpha^{+}}. N' \simeq^{\leq} \forall \overrightarrow{\beta^{+}}. M'$ means that there exists a bijection $\mu : \overrightarrow{\beta^{+}} \cap \text{fv } M' \leftrightarrow \overrightarrow{\alpha^{+}} \cap \text{fv } N'$ such that $\Theta, \overrightarrow{\alpha^{+}} \vdash [\mu]M' \simeq^{\leq} N'$.

Notice that the application of bijection μ to M' does not change its size (which is less than the size of M), hence the induction hypothesis applies. This way, $[\mu]M' \simeq^D N'$ (and by symmetry, $N' \simeq^D [\mu]M'$) holds by induction. Then we apply (\forall^{\simeq^D}) to get $\forall \overrightarrow{\alpha^+}$, $N' \simeq^D \forall \overrightarrow{\beta^+}$, M', i.e. $N \simeq^D M$.

+ The proof is symmetric to the proof of the negative case.

3.1.5 Variable Ordering.

Observation 2 (Ordering is deterministic). If ord $varsin N = \vec{\alpha}_1$ and ord $varsin N = \vec{\alpha}_2$ then $\vec{\alpha}_1 = \vec{\alpha}_2$. If ord $varsin P = \vec{\alpha}_1$ and ord $varsin P = \vec{\alpha}_2$ then $\vec{\alpha}_1 = \vec{\alpha}_2$. This way, we can use ord varsin N and as a function on N, and ord varsin P as a function on P.

Proof. By mutual structural induction on N and P. Notice that the shape of the term N or P uniquely determines the last used inference rule, and all the premises are deterministic on the input.

Lemma 35 (Soundness of variable ordering). Variable ordering extracts used free variables.

- ord vars in $N = vars \cap fv N$ (as sets)

 + ord $varsin P = vars \cap fv P$ (as sets)

Proof. We prove it by mutual induction on ord *vars* in $N = \vec{\alpha}$ and ord *vars* in $P = \vec{\alpha}$. The only non-trivial cases are (\rightarrow^{ORD}) and (\forall^{ORD}) .

Case 1. (\rightarrow^{ORD}) Then the inferred ordering judgement has shape ord $varsin P \rightarrow N = \vec{\alpha}_1, (\vec{\alpha}_2 \setminus \vec{\alpha}_1)$ and by inversion, ord $varsin P = \vec{\alpha}_1$ and ord $varsin N = \vec{\alpha}_2$.

By definition of free variables, $vars \cap f \lor P \to N = vars \cap f \lor P \cup vars \cap f \lor N$, and since by the induction hypothesis $vars \cap f \lor P = \overrightarrow{\alpha}_1$ and $vars \cap f \lor N = \overrightarrow{\alpha}_2$, we have $vars \cap f \lor P \to N = \overrightarrow{\alpha}_1 \cup \overrightarrow{\alpha}_2$.

On the other hand, as a set $\vec{\alpha}_1 \cup \vec{\alpha}_2$ is equal to $\vec{\alpha}_1$, $(\vec{\alpha}_2 \setminus \vec{\alpha}_1)$.

Case 2. (\forall^{ORD}) . Then the inferred ordering judgement has shape ord $vars \text{ in } \forall \overrightarrow{\alpha^+}$. $N = \overrightarrow{\alpha}$, and by inversion, $vars \cap \overrightarrow{\alpha^+} = \emptyset$ ord $vars \text{ in } N = \overrightarrow{\alpha}$. The latter implies that $vars \cap \text{ fv } N = \overrightarrow{\alpha}$. We need to show that $vars \cap \text{ fv } \forall \overrightarrow{\alpha^+}$. $N = \overrightarrow{\alpha}$, or equivalently, that $vars \cap (\text{ fv } N \setminus \overrightarrow{\alpha^+}) = vars \cap \text{ fv } N$, which holds since $vars \cap \overrightarrow{\alpha^+} = \emptyset$.

Corollary 12 (*Additivity of ordering*). Variable ordering is additive (in terms of set union) with respect to its first argument.

- ord $(vars_1 \cup vars_2)$ in $N = \text{ord } vars_1$ in $N \cup \text{ord } vars_2$ in N (as sets)
- + ord $(vars_1 \cup vars_2)$ in $P = \text{ord } vars_1 \text{ in } P \cup \text{ord } vars_2 \text{ in } P$ (as sets)

Lemma 36 (*Weakening of ordering*). Only used variables matter in the first argument of the ordering,

- ord $(vars \cap fv N)$ in N = ord vars in N
- + ord $(vars \cap fv P)$ in P = ord vars in P

Proof. Mutual structural induction on N and P.

Case 1. If *N* is a variable α^- , we notice that $\alpha^- \in vars$ is equivalent to $\alpha^- \in vars \cap \alpha^-$.

Case 2. If *N* has shape $\uparrow P$, then the required property holds immediately by the induction hypothesis, since $fv(\uparrow P) = fv(P)$.

, Vol. 1, No. 1, Article . Publication date: July 2024.

Case 3. If the term has shape $P \to N$ then $(\to^{\operatorname{ORD}})$ was applied to infer ord $(\mathit{vars} \cap (\mathsf{fv} P \cup \mathsf{fv} N))$ in $P \to N$ and ord $\mathit{vars} \operatorname{in} P \to N$. By inversion, the result of ord $(\mathit{vars} \cap (\mathsf{fv} P \cup \mathsf{fv} N))$ in $P \to N$ depends on $A = \operatorname{ord} (\mathit{vars} \cap (\mathsf{fv} P \cup \mathsf{fv} N))$ in P and $P \to N$ depends on $P \to N$ dep

Let us show that A = B and X = Y, so the results are equal. By the induction hypothesis and set properties, ord $(vars \cap (f \vee P \cup f \vee N))$ in $P = ord (vars \cap (f \vee P \cup f \vee N)) \cap f \vee (P)$ in $P = ord vars \cap f \vee (P)$ in P = ord vars in P. Analogously, ord $(vars \cap (f \vee P \cup f \vee N))$ in P = ord vars in P.

Case 4. If the term has shape $\forall \overrightarrow{\alpha^+}$. N, we can assume that $\overrightarrow{\alpha^+}$ is disjoint from *vars*, since we operate on alpha-equivalence classes. Then using the induction hypothesis, set properties and (\forall^{ORD}) : ord $vars \cap (fv(\overrightarrow{N}) \land \overrightarrow{\alpha^+})$ in $\overrightarrow{N} = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in $N = ord vars \cap (fv(N) \land \overrightarrow{\alpha^+})$ in N = ord vars

Corollary 13 (Idempotency of ordering).

- If ord vars in $N = \vec{\alpha}$ then ord $\vec{\alpha}$ in $N = \vec{\alpha}$,
- + If ord vars in $P = \vec{\alpha}$ then ord $\vec{\alpha}$ in $P = \vec{\alpha}$;

Proof. By Lemmas 35 and 36.

 Next, we make a set-theoretical observation that will be useful further. In general, any injective function (its image) distributes over the set intersection. However, for convenience, we allow the bijections on variables to be applied *outside of their domains* (as identities), which may violate the injectivity. To deal with these cases, we define a special notion of bijections collision-free on certain sets in such a way that a bijection that is collision-free on *P* and *Q*, distributes over intersection of *P* and *Q*.

Definition 29 (*Collision-free Bijection*). We say that a bijection $\mu: A \leftrightarrow B$ between sets of variables is **collision-free on sets** P and Q if and only if

- (1) $\mu(P \cap A) \cap Q = \emptyset$
- (2) $\mu(Q \cap A) \cap P = \emptyset$

Observation 19. Suppose that $\mu : A \leftrightarrow B$ is a bijection between two sets of variables, and μ is collision-free on P and Q. Then $\mu(P \cap Q) = \mu(P) \cap \mu(Q)$.

Lemma 37 (*Distributivity of renaming over variable ordering*). Suppose that μ is a bijection between two sets of variables $\mu : A \leftrightarrow B$.

- If μ is collision-free on vars and $f \vee N$ then $[\mu]$ (ord vars in N) = ord ($[\mu]$ vars) in $[\mu]N$
- + If μ is collision-free on vars and fv P then $[\mu]$ (ord vars in P) = ord $([\mu]$ vars) in $[\mu]$ P

Proof. Mutual induction on N and P.

let us consider four cases:

 $a. \alpha^- \in A$ and $\alpha^- \in vars$. Then

$$[\mu](\operatorname{ord} \operatorname{vars} \operatorname{in} N) = [\mu](\operatorname{ord} \operatorname{vars} \operatorname{in} \alpha^{-})$$

$$= [\mu]\alpha^{-} \qquad \qquad \operatorname{by}(\operatorname{VaR}^{\operatorname{ORD}}_{+\in})$$

$$= \beta^{-} \qquad \qquad \operatorname{for some} \beta^{-} \in B \qquad \qquad (\operatorname{notice} \beta^{-} \in [\mu] \operatorname{vars})$$

$$= \operatorname{ord} [\mu] \operatorname{vars} \operatorname{in} \beta^{-} \qquad \qquad \operatorname{by}(\operatorname{VaR}^{\operatorname{ORD}}_{+\in}), \operatorname{as} \beta^{-} \in [\mu] \operatorname{vars}$$

$$= \operatorname{ord} [\mu] \operatorname{vars} \operatorname{in} [\mu] \alpha^{-}$$

b. $\alpha^- \notin A$ and $\alpha^- \notin vars$

Notice that $[\mu]$ (ord vars in N) = $[\mu]$ (ord vars in α^-) = \cdot by $(VAR_{+\notin}^{ORD})$. On the other hand, ord $[\mu]$ vars in $[\mu]\alpha^-$ = ord $[\mu]$ vars in α^- = \cdot The latter equality is from $(VAR_{+\notin}^{ORD})$, because μ is collision-free on vars and fv N, so fv $N \ni \alpha^- \notin \mu(A \cap vars) \cup vars \supseteq [\mu] vars$.

c. $\alpha^- \in A$ but $\alpha^- \notin vars$

Then $[\mu]$ (ord vars in N) = $[\mu]$ (ord vars in α^-) = \cdot by (VAR $_{+\note}^{ORD}$). To prove that ord $[\mu]$ vars in $[\mu]\alpha^- = \cdot$, we apply (VAR $_{+\note}^{ORD}$). Let us show that $[\mu]\alpha^- \notin [\mu] vars$. Since $[\mu]\alpha^- = \mu(\alpha^-)$ and $[\mu] vars \subseteq \mu(A \cap vars) \cup vars$, it suffices to prove $\mu(\alpha^-) \notin \mu(A \cap vars) \cup vars$.

- (i) If there is an element $x \in A \cap vars$ such that $\mu x = \mu \alpha^-$, then $x = \alpha^-$ by bijectivity of μ , which contradicts with $\alpha^- \notin vars$. This way, $\mu(\alpha^-) \notin \mu(A \cap vars)$.
- (ii) Since μ is collision-free on vars and fv N, $\mu(A \cap \text{fv } N) \ni \mu(\alpha^-) \notin \text{vars}$.
- d. $\alpha^- \notin A$ but $\alpha^- \in vars$ ord $[\mu] vars$ in $\alpha^- = \alpha^-$. The latter is by $(VAR_{+\notin}^{ORD})$, because $\alpha^- = [\mu] \alpha^- \in [\mu] vars$ since $\alpha^- \in vars$. On the other hand, $[\mu]$ (ord vars in N) = $[\mu]$ (ord vars in α^-) = $[\mu] \alpha^- = \alpha^-$.

Case 2. $N = \uparrow P$

```
[\mu](\operatorname{ord} \operatorname{varsin} N) = [\mu](\operatorname{ord} \operatorname{varsin} \uparrow P)
= [\mu](\operatorname{ord} \operatorname{varsin} P) \qquad \text{by } (\uparrow^{\operatorname{ORD}})
= \operatorname{ord} [\mu] \operatorname{varsin} [\mu] P \qquad \text{by the induction hypothesis}
= \operatorname{ord} [\mu] \operatorname{varsin} [\mu] P \qquad \text{by } (\uparrow^{\operatorname{ORD}})
= \operatorname{ord} [\mu] \operatorname{varsin} [\mu] \uparrow P \qquad \text{by the definition of substitution}
= \operatorname{ord} [\mu] \operatorname{varsin} [\mu] N
```

```
Case 3. N = P \rightarrow M
4117
4118
                          [\mu] (ord vars in N)
4119
                            = [\mu] (\text{ord } vars \text{ in } P \rightarrow M)
                            = [\mu](\overrightarrow{\alpha}_1, (\overrightarrow{\alpha}_2 \setminus \overrightarrow{\alpha}_1))
                                                                                                  where ord vars in P = \vec{\alpha}_1 and ord vars in M = \vec{\alpha}_2
4122
                            = [\mu] \overrightarrow{\alpha}_1, [\mu] (\overrightarrow{\alpha}_2 \setminus \overrightarrow{\alpha}_1)
                            = [\mu] \overrightarrow{\alpha}_1, ([\mu] \overrightarrow{\alpha}_2 \setminus [\mu] \overrightarrow{\alpha}_1)
                                                                                                  by induction on \vec{\alpha}_2; the ind. step is similar to case 1.
                                                                                                  notice that \mu is collision free on \vec{\alpha}_1 and \vec{\alpha}_2
4126
                                                                                                  since \vec{\alpha}_1 \subseteq vars and \vec{\alpha}_2 \subseteq fv N
4127
                            = [\mu] \overrightarrow{\alpha}_1, ([\mu] \overrightarrow{\alpha}_2 \setminus [\mu] \overrightarrow{\alpha}_1)

        Proof. Mutual induction on N \simeq^D M and P \simeq^D Q. Let us consider the rule inferring N \simeq^D M.
4209
```

, Vol. 1, No. 1, Article . Publication date: July 2024.

Case 1. $(VAR_{-}^{\simeq D})$

Case 2. (\uparrow^{\simeq^D})

4210

4211 4212

Case 3. (\rightarrow^{\simeq^D}) Then the equivalence has shape $P \to N \simeq^D Q \to M$, and by inversion, $P \simeq^D Q$ and $N \simeq^D M$. Then by the induction hypothesis, ord vars in P = ord vars in Q and ord vars in N = ord vars in M. Since the resulting ordering for $P \to N$ and $Q \to M$ depend on the ordering of the corresponding components, which are equal, the results are equal.

Case 4. (\forall^{\cong^D}) Then the equivalence has shape $\forall \overrightarrow{\alpha^+}$. $N \cong^D \forall \overrightarrow{\beta^+}$. M. and by inversion there exists $\mu : (\overrightarrow{\beta^+} \cap \text{fv } M) \leftrightarrow (\overrightarrow{\alpha^+} \cap \text{fv } N)$ such that

- $\overrightarrow{\alpha^+} \cap \text{fv } M = \emptyset \text{ and }$
- $N \simeq^D [\mu]M$

4254

4255 4256

4257 4258

4259

4260 4261

4262 4263 Let us assume that vars is disjoint from $\overrightarrow{\alpha^+}$ and $\overrightarrow{\beta^+}$ (we can always alpha-rename the bound variables). Then ord vars in $\forall \overrightarrow{\alpha^+}$. N = ord vars in N, ord vars in $\forall \overrightarrow{\alpha^+}$. M = ord vars in M and by the induction hypothesis, ord vars in N = ord vars in $[\mu]M$. This way, it suffices tho show that ord vars in $[\mu]M = \text{ord } vars$ in M. It holds by Lemma 38 since vars is disjoint form the domain and the codomain of $u: (\overrightarrow{\beta^+} \cap fvM) \leftrightarrow (\overrightarrow{\alpha^+} \cap fvN)$ by assumption.

Case 5. The positive cases are proved symmetrically.

3.1.6 Normaliztaion.

Observation 3 (*Normalization is deterministic*). If nf(N) = M and nf(N) = M' then M = M'. If nf(P) = Q and nf(P) = Q' then Q = Q'. This way, we can use normalization as a function.

Proof. By straightforward induction using Observation 2.

Lemma 40. Free variables are not changed by the normalization

- fv N = fv nf (N)
- + fv P = fv nf(P)

Proof. By mutual induction on N and P. The base cases ((VAR_+^{NF})) and (VAR_+^{NF})) are trivial; the congruent cases ((\uparrow^{NF}), (\downarrow^{NF}), and (\rightarrow^{NF})) are proved by the induction hypothesis.

Let us consider the case when the term is formed by \forall , that is the normalization judgment has a shape $\operatorname{nf}(\forall \overrightarrow{\alpha^+}. N) = \forall \overrightarrow{\alpha^+'}. N'$, where by inversion $\operatorname{nf}(N) = N'$ and $\operatorname{ord} \overrightarrow{\alpha^+} \operatorname{in} N' = \overrightarrow{\alpha^+'}.$ By the induction hypothesis, $\operatorname{fv} N = \operatorname{fv} N'$. Since $\operatorname{fv}(\forall \overrightarrow{\alpha^+}. N) = \operatorname{fv} N \setminus \overrightarrow{\alpha^+}$, and $\operatorname{fv}(\forall \overrightarrow{\alpha^{+'}}. N') = \operatorname{fv} N' \setminus \overrightarrow{\alpha^{+'}}$, it is left to show that $\operatorname{fv} N \setminus \overrightarrow{\alpha^+} = \operatorname{fv} N \setminus \overrightarrow{\alpha^{+'}}.$ By Lemma 39, $\overrightarrow{\alpha^+} = \overrightarrow{\alpha^+} \cap \operatorname{fv} N' = \overrightarrow{\alpha^+} \cap \operatorname{fv} N$. Then $\operatorname{fv} N \setminus \overrightarrow{\alpha^+} = \operatorname{fv} N \setminus (\overrightarrow{\alpha^+} \cup \operatorname{fv} N)$ by set-theoretic properties, and thus, $\operatorname{fv} N \setminus \overrightarrow{\alpha^+} = \operatorname{fv} N \setminus \overrightarrow{\alpha^{+'}}.$

The case when the term is positive and formed by \exists is symmetric.

Lemma 41 (Soundness of normalization).

$$-N \simeq^D \mathsf{nf}(N)$$

 $+ P \simeq^D \mathsf{nf}(P)$

Proof. Mutual induction on nf(N) = M and nf(P) = Q. Let us consider how this judgment is formed:

Case 1. (VAR_{-}^{NF}) and (VAR_{+}^{NF})

By the corresponding equivalence rules.

Case 2. (\uparrow^{NF}) , (\downarrow^{NF}) , and (\rightarrow^{NF})

By the induction hypothesis and the corresponding congruent equivalence rules.

Case 3. (\forall^{NF}) , i.e. $nf(\forall \overrightarrow{\alpha^+}, N) = \forall \overrightarrow{\alpha^+}', N'$

From the induction hypothesis, we know that $N \cong^D N'$. In particular, by Lemma 26, $\text{fv } N \equiv \text{fv } N'$. Then by Lemma 35, $\overrightarrow{\alpha^+}' \equiv \overrightarrow{\alpha^+} \cap \text{fv } N' \equiv \overrightarrow{\alpha^+} \cap \text{fv } N$, and thus, $\overrightarrow{\alpha^+}' \cap \text{fv } N' \equiv \overrightarrow{\alpha^+} \cap \text{fv } N$.

To prove $\forall \overrightarrow{\alpha^+}$. $N \simeq^D \forall \overrightarrow{\alpha^+}'$. N', it suffices to provide a bijection $\mu : \overrightarrow{\alpha^+}' \cap \text{fv } N' \leftrightarrow \overrightarrow{\alpha^+} \cap \text{fv } N$ such that $N \simeq^D [\mu] N'$. Since these sets are equal, we take $\mu = id$.

Case 4. (\exists^{NF}) Same as for case 3.

Corollary 14 (Normalization preserves well-formedness).

```
+\Theta \vdash P \iff \Theta \vdash \mathsf{nf}(P),
```

$$-\Theta \vdash N \iff \Theta \vdash \mathsf{nf}(N)$$

Proof. Immediately from Lemmas 28 and 41.

Corollary 15 (Normalization preserves well-formedness of substitution).

$$\Theta_2 \vdash \sigma : \Theta_1 \iff \Theta_2 \vdash \mathsf{nf}(\sigma) : \Theta_1$$

Proof. Let us prove the forward direction. Suppose that $\alpha^{\pm} \in \Theta_1$. Let us show that $\Theta_2 \vdash [\mathsf{nf}(\sigma)]\alpha^{\pm}$. By the definition of substitution normalization, $[\mathsf{nf}(\sigma)]\alpha^{\pm} = \mathsf{nf}([\sigma]\alpha^{\pm})$. Then by Corollary 14, to show $\Theta_2 \vdash \mathsf{nf}([\sigma]\alpha^{\pm})$, it suffices to show $\Theta_2 \vdash [\sigma]\alpha^{\pm}$, which holds by the assumption $\Theta_2 \vdash \sigma : \Theta_1$.

The backward direction is proved analogously.

Lemma 42 (Normalization preserves substitution signature). Suppose that σ is a substitution, Θ_1 and Θ_2 are contexts. Then $\Theta_2 \vdash \sigma : \Theta_1$ implies $\Theta_2 \vdash \mathsf{nf}(\sigma) : \Theta_1$.

Proof. Suppose that $\alpha^{\pm} \in \Theta_1$. Then by Corollary 14, $\Theta_2 \vdash \mathsf{nf}([\sigma]\alpha^{\pm}) = [\mathsf{nf}(\sigma)]\alpha^{\pm}$ is equivalent to $\Theta_2 \vdash [\sigma]\alpha^{\pm}$.

Suppose that $\alpha^{\pm} \notin \Theta_1$. $\Theta_2 \vdash \sigma : \Theta_1$ means that $[\sigma]\alpha^{\pm} = \alpha^{\pm}$, and then $[\mathsf{nf}(\sigma)]\alpha^{\pm} = \mathsf{nf}([\sigma]\alpha^{\pm}) = \mathsf{nf}(\alpha^{\pm}) = \alpha^{\pm}$.

Corollary 16 (Normalization is sound w.r.t. subtyping-induced equivalence).

```
+ if \Theta \vdash P then \Theta \vdash P \simeq^{\leq} \mathsf{nf}(P),
```

```
- if Θ \vdash N then Θ \vdash N \simeq<sup>\leqslant</sup> nf (N).
```

Proof. Immediately from Lemmas 29 and 41 and Corollary 14.

Corollary 17 (*Normalization preserves subtyping*). Assuming all the types are well-formed in context Θ ,

```
+\Theta \vdash P \geqslant O \iff \Theta \vdash \mathsf{nf}(P) \geqslant \mathsf{nf}(O),
```

$$-\Theta \vdash N \leqslant M \iff \Theta \vdash \mathsf{nf}(N) \leqslant \mathsf{nf}(M).$$

Proof.

- + \Rightarrow Let us assume $\Theta \vdash P \geqslant Q$. By Corollary 16, $\Theta \vdash P \cong^{\leq}$ nf (P) and $\Theta \vdash Q \cong^{\leq}$ nf (Q), in particular, by inversion, $\Theta \vdash$ nf $(P) \geqslant P$ and $\Theta \vdash Q \geqslant$ nf (Q). Then by transitivity of subtyping (Lemma 24), $\Theta \vdash$ nf $(P) \geqslant$ nf (Q).
 - \Leftarrow Let us assume Θ ⊢ nf (P) ≥ nf (Q). Also by Corollary 16 and inversion, Θ ⊢ P ≥ nf (P) and Θ ⊢ nf (Q) ≥ Q. Then by the transitivity, Θ ⊢ P ≥ Q.
- The negative case is proved symmetrically.

4335
4336 **Corollary 18** (Normalization preserves ordering). For any vars,

- ord varsinnf(N) = ord <math>varsin M
- + ord vars in nf (P) = ord vars in Q

Proof. Immediately from Lemmas 39 and 41.

Lemma 43 (*Distributivity of normalization over substitution*). Normalization of a term distributes over substitution. Suppose that σ is a substitution, N and P are types. Then

```
- \inf([\sigma]N) = [\inf(\sigma)]\inf(N)
```

+
$$nf([\sigma]P) = [nf(\sigma)]nf(P)$$

where $\operatorname{nf}(\sigma)$ means pointwise normalization: $[\operatorname{nf}(\sigma)]\alpha^- = \operatorname{nf}([\sigma]\alpha^-)$.

Proof. Mutual induction on N and P.

```
Case 1. N = \alpha^-

\operatorname{nf}([\sigma]N) = \operatorname{nf}([\sigma]\alpha^-) = [\operatorname{nf}(\sigma)]\alpha^-.

[\operatorname{nf}(\sigma)]\operatorname{nf}(N) = [\operatorname{nf}(\sigma)]\operatorname{nf}(\alpha^-) = [\operatorname{nf}(\sigma)]\alpha^-.
```

```
Case 2. P = \alpha^+
```

Similar to case 1.

Case 3. If the type is formed by \rightarrow , \uparrow , or \downarrow , the required equality follows from the congruence of the normalization and substitution and the induction hypothesis. For example, if $N = P \rightarrow M$ then

Case 4.
$$N = \forall \overrightarrow{\alpha^+}. M$$

$$[nf(\sigma)]nf(N) = [nf(\sigma)]nf(\forall \overrightarrow{\alpha^+}. M)$$

$$= [nf(\sigma)] \forall \overrightarrow{\alpha^+}. nf(M) \qquad \text{where } \overrightarrow{\alpha^+} = \text{ord } \overrightarrow{\alpha^+} \text{ in } nf(M)$$

$$= \text{ord } \overrightarrow{\alpha^+} \text{ in } M$$

$$(\text{the latter is by Corollary 18})$$

$$\operatorname{nf}([\sigma]N) = \operatorname{nf}([\sigma] \forall \overrightarrow{\alpha^{+}}. M) \\
= \operatorname{nf}(\forall \overrightarrow{\alpha^{+}}. [\sigma]M) \qquad \operatorname{assuming} \overrightarrow{\alpha^{+}} \cap \Theta_{1} = \emptyset \text{ and } \overrightarrow{\alpha^{+}} \cap \Theta_{2} = \emptyset \\
= \forall \overrightarrow{\beta^{+}}. \operatorname{nf}([\sigma]M) \qquad \operatorname{where} \overrightarrow{\beta^{+}} = \operatorname{ord} \overrightarrow{\alpha^{+}} \operatorname{in} \operatorname{nf}([\sigma]M) \\
= \operatorname{ord} \overrightarrow{\alpha^{+}} \operatorname{in}[\sigma]M \\
\text{(the latter is by Corollary 18)} \\
= \forall \overrightarrow{\alpha^{+'}}. \operatorname{nf}([\sigma]M) \qquad \operatorname{by Lemma 38}, \\
\overrightarrow{\beta^{+}} = \overrightarrow{\alpha^{+'}} \operatorname{since} \overrightarrow{\alpha^{+}} \operatorname{is disjoint with} \Theta_{1} \operatorname{and} \Theta_{2} \\
= \forall \overrightarrow{\alpha^{+'}}. [\operatorname{nf}(\sigma)]\operatorname{nf}(M) \qquad \operatorname{by the induction hypothesis}$$

To show the alpha-equivalence of $[\mathsf{nf}(\sigma)] \forall \overrightarrow{\alpha^{+\prime}}$. $\mathsf{nf}(M)$ and $\forall \overrightarrow{\alpha^{+\prime}}$. $[\mathsf{nf}(\sigma)] \mathsf{nf}(M)$, we can assume that $\overrightarrow{\alpha^{+\prime}} \cap \Theta_1 = \emptyset$, and $\overrightarrow{\alpha^{+\prime}} \cap \Theta_2 = \emptyset$.

Case 5.
$$P = \exists \overrightarrow{\alpha}$$
. Q
Same as for case 4.

 Corollary 19 (*Commutativity of normalization and renaming*). Normalization of a term commutes with renaming. Suppose that μ is a bijection between two sets of variables $\mu : A \leftrightarrow B$. Then

, Vol. 1, No. 1, Article . Publication date: July 2024.

$$- \operatorname{nf}([\mu]N) = [\mu]\operatorname{nf}(N)$$

+
$$nf([\mu]P) = [\mu]nf(P)$$

Lemma 44 (Completeness of Normalization w.r.t. Declarative Equivalence). Normalization returns the same representative for equivalent types.

Proof. Mutual induction on $N \simeq^D M$ and $P \simeq^D Q$.

- If $N \simeq^D M$ then nf(N) = nf(M),
- + if $P \simeq^D Q$ then nf (P) = nf (O).

Case 1. (\forall^{\simeq^D}) From the normalization definition,

- $\operatorname{nf}(\forall \overrightarrow{\alpha^+}, N) = \forall \overrightarrow{\alpha^{+\prime}}, \operatorname{nf}(N)$ where $\overrightarrow{\alpha^{+\prime}}$ is $\operatorname{ord} \overrightarrow{\alpha^+} \operatorname{innf}(N)$
- $\operatorname{nf}(\forall \overrightarrow{\beta^+}, M) = \forall \overrightarrow{\beta^+}', \operatorname{nf}(M)$ where $\overrightarrow{\beta^+}'$ is $\operatorname{ord} \overrightarrow{\beta^+} \operatorname{innf}(M)$

Let us take $\mu: (\overrightarrow{\beta^+} \cap \text{fv } M) \leftrightarrow (\overrightarrow{\alpha^+} \cap \text{fv } N)$ from the inversion of the equivalence judgment. Notice that from Lemmas 35 and 40, the domain and the codomain of μ can be written as $\mu: \overrightarrow{\beta^{+\prime}} \leftrightarrow \overrightarrow{\alpha^{+\prime}}$

To show the alpha-equivalence of $\forall \alpha^{+\prime}$, $\mathsf{nf}(N)$ and $\forall \beta^{+\prime}$, $\mathsf{nf}(M)$, it suffices to prove that (i) $[\mu]$ nf (M) = nf (N) and

- (ii) $[u] \overrightarrow{\beta}^{+\prime} = \overrightarrow{\alpha}^{+\prime}$.
 - (i) $[\mu]$ nf (M) = nf $([\mu]M)$ = nf (N). The first equality holds by Corollary 19, the second by the induction hypothesis.

(ii) $[\mu] \overrightarrow{\beta}^{+\prime} = [\mu] \text{ ord } \overrightarrow{\beta}^{+} \text{ in nf } (M)$ by the definition of $\overrightarrow{\beta}^+$ $= [\mu] \operatorname{ord} (\overrightarrow{\beta^+} \cap \operatorname{fv} M) \operatorname{innf} (M)$ from Lemmas 36 and 40 = ord $[\mu](\overrightarrow{\beta^+} \cap \text{fv } M)$ in $[\mu]$ nf (M)by Lemma 37, because $\overrightarrow{\alpha^+} \cap \text{fy } N \cap \text{fy nf } (M) \subseteq \overrightarrow{\alpha^+} \cap \text{fy } M = \emptyset$, and $\overrightarrow{\alpha^+} \cap \text{fv } N \cap (\overrightarrow{\beta^+} \cap \text{fv } M) \subseteq \overrightarrow{\alpha^+} \cap \text{fv } M = \emptyset$ = ord $[\mu](\overrightarrow{\beta^+} \cap \text{fv} M)$ in nf(N)as $[\mu]$ nf (M) = nf (N) $= \operatorname{ord}(\overrightarrow{\alpha^+} \cap \operatorname{fv} N) \operatorname{innf}(N)$ μ is a bijection between $\overrightarrow{\alpha^+} \cap \text{fy } N \text{ and } \overrightarrow{\beta^+} \cap \text{fy } M$ = ord $\overrightarrow{\alpha^+}$ in nf (N)from Lemmas 36 and 40 $-\stackrel{\longrightarrow}{\alpha^{+\prime}}$ by the definition of $\overrightarrow{\alpha}^{+\prime}$

Case 2. (\exists^{\simeq^D}) Same as for case 1.

Case 3. Other rules are congruent, and thus, proved by the corresponding congruent alphaequivalence rule, which is applicable by the induction hypothesis.

Lemma 45 (Algorithmization of Declarative Equivalence). Declarative equivalence is the equality of normal forms.

+ $P \simeq^D Q \iff \operatorname{nf}(P) = \operatorname{nf}(Q),$ - $N \simeq^D M \iff \operatorname{nf}(N) = \operatorname{nf}(M).$

Proof.

- + Let us prove both directions separately.
 - \Rightarrow exactly by Lemma 44,
 - \Leftarrow from Lemma 41, we know $P \simeq^D$ nf $(P) = \text{nf } (Q) \simeq^D Q$, then by transitivity (Lemma 27), $P \simeq^D Q$.
- For the negative case, the proof is the same.

Corollary 20 (Completeness of Normalization w.r.t. Subtyping-Induced Equivalence). Assuming all the types below are well-formed in Θ :

, Vol. 1, No. 1, Article . Publication date: July 2024.

- 4509 + if $\Theta \vdash P \simeq^{\leq} Q$ then $\inf(P) = \inf(Q)$,
 4510
 - if Θ \vdash $N \simeq$ $^{\leq} M$ then nf (N) = nf (M).

Proof. Immediately from Lemmas 34 and 44.

Lemma 46 (Idempotence of normalization). Normalization is idempotent

- $\inf(\inf(N)) = \inf(N)$
- + $\inf(\inf(P)) = \inf(P)$

Proof. By applying Lemma 44 to Lemma 41.

Lemma 47. The result of a substitution is normalized if and only if the initial type and the substitution are normalized.

Suppose that σ is a substitution $\Theta_2 \vdash \sigma : \Theta_1$, P is a positive type $(\Theta_1 \vdash P)$, N is a negative type $(\Theta_1 \vdash N)$. Then

- + $[\sigma]P$ is normal $\iff \begin{cases} \sigma|_{\mathsf{fv}(P)} & \text{is normal} \\ P & \text{is normal} \end{cases}$
- $\ [\sigma] N \text{is normal} \iff \begin{cases} \sigma|_{\mathsf{fv}\,(N)} & \text{is normal} \\ N & \text{is normal} \end{cases}$

Proof. Mutual induction on $\Theta_1 \vdash P$ and $\Theta_1 \vdash N$.

Case 1. $N = \alpha^-$

Then N is always normal, and the normality of $\sigma|_{\alpha^-}$ by the definition means $[\sigma]_{\alpha^-}$ is normal.

Case 2. $N = P \rightarrow M$

$$[\sigma](P \to M) \text{ is normal} \iff [\sigma]P \to [\sigma]M \text{ is normal}$$
 substitution definition}
$$\iff \begin{cases} [\sigma]P & \text{is normal} \\ [\sigma]M & \text{is normal} \end{cases}$$

$$\iff \begin{cases} P & \text{is normal} \\ \sigma|_{\mathsf{fv}(P)} & \text{is normal} \\ M & \text{is normal} \end{cases}$$
 induction hypothesis}
$$\Leftrightarrow \begin{cases} P \to M & \text{is normal} \\ \sigma|_{\mathsf{fv}(P) \cup \mathsf{fv}(M)} & \text{is normal} \end{cases}$$

$$\iff \begin{cases} P \to M & \text{is normal} \\ \sigma|_{\mathsf{fv}(P) \cup \mathsf{fv}(M)} & \text{is normal} \end{cases}$$

$$\iff \begin{cases} P \to M & \text{is normal} \\ \sigma|_{\mathsf{fv}(P \to M)} & \text{is normal} \end{cases}$$

Case 3. $N = \uparrow P$

By congruence and the inductive hypothesis, similar to case 2

Case 4.
$$N = \forall \overrightarrow{\alpha^+}$$
. M

$$[\sigma](\forall \overrightarrow{\alpha^+}. M)$$
 is normal $\iff (\forall \overrightarrow{\alpha^+}. [\sigma]M)$ is normal

$$\int [\sigma] M \text{ is normal}$$

assuming
$$\overrightarrow{\alpha^+} \cap \Theta_1 = \emptyset$$
 and $\overrightarrow{\alpha^+} \cap \Theta_2 = \emptyset$

$$\iff \begin{cases} [\sigma]M \text{ is normal} \\ \text{ord } \overrightarrow{\alpha^+} \text{ in } [\sigma]M = \overrightarrow{\alpha^+} \end{cases}$$

$$\iff \begin{cases} [\sigma]M \text{ is normal} \\ \text{ord } \overrightarrow{\alpha^+} \text{ in } M = \overrightarrow{\alpha^+} \end{cases}$$

$$\begin{cases}
\sigma|_{\mathsf{fv}(M)} \text{ is normal} \\
M \text{ is normal} \\
\text{ord } \overrightarrow{\alpha^+} \text{ in } M = \overrightarrow{\alpha^+}
\end{cases}$$

$$\iff \begin{cases} \sigma|_{\mathsf{fy}}(\forall \alpha^{\overrightarrow{+}}.M) \text{ is normal} \\ \forall \alpha^{\overrightarrow{+}}.M \text{ is normal} \end{cases}$$

since
$$fv(\forall \alpha^+. M) = fv(M)$$
;
by the definition of normalization

Case 5. $P = \dots$

The positive cases are done in the same way as the negative ones.

Lemma 48 (Algorithmization of subtyping-induced equivalence). Mutual subtyping is the equality of normal forms. Assuming all the types below are well-formed in Θ :

$$+\Theta \vdash P \simeq^{\leqslant} Q \iff \mathsf{nf}(P) = \mathsf{nf}(Q),$$

$$-\Theta \vdash N \simeq^{\leqslant} M \iff \mathsf{nf}(N) = \mathsf{nf}(M).$$

Proof. Let us prove the positive case, the negative case is symmetric. We prove both directions of ⇔ separately:

- ⇒ exactly Corollary 20;
- \Leftarrow by Lemmas 29 and 45.

 Corollary 21 (Substitution preserves declarative equivalence). Suppose that σ is a substitution. Then

+
$$P \simeq^D Q$$
 implies $[\sigma]P \simeq^D [\sigma]Q$

$$-N \simeq^D M$$
 implies $[\sigma]N \simeq^D [\sigma]M$

, Vol. 1, No. 1, Article . Publication date: July 2024.

Proof.

```
P \simeq^D Q \Rightarrow \text{nf } (P) = \text{nf } (Q) by Lemma 48

\Rightarrow [\text{nf } (\sigma)] \text{nf } (P) = [\text{nf } (\sigma)] \text{nf } (Q)

\Rightarrow \text{nf } ([\sigma]P) = \text{nf } ([\sigma]Q) by Lemma 43

\Rightarrow [\sigma]P \simeq^D [\sigma]Q by Lemma 48
```

3.2 Relation to System F

Lemma 51 (Subtyping elaboration term can be removed).

- − For any Θ, *N*, and *M*, Θ ⊢ *N* ≤ *M* holds if and only if there exists *t* such that Θ ⊢ *N* ≤ *M* \rightsquigarrow *t*;
- + For any Θ , P, and Q, $\Theta \vdash P \geqslant Q$ holds if and only if there exists t such that $\Theta \vdash P \geqslant Q \leadsto t$.

Proof. We prove it separately in both directions of the implication. both of the implications are proved by simple induction on the judgment. \Box

Observation 4 (Type depolarization distributes over substitution).

- $+ |[\sigma]N| = [|\sigma|]|N|,$
- $|\lceil \sigma \rceil P| = \lceil |\sigma| \rceil |P|.$

Proof. By mutual induction on the type N and P.

Lemma 52 (Soundness of Subtyping Elaboration).

- If $\Theta \vdash N \leq M \rightsquigarrow t$ then $|\Theta|$; $\vdash t : |N| \rightarrow |M|$;
- + if $\Theta \vdash P \geqslant Q \rightsquigarrow t$ then $|\Theta|$; $\vdash t : |Q| \rightarrow |P|$.

Proof. We prove it by (mutual) induction on $\Theta \vdash N \leq M \rightsquigarrow t$ and $\Theta \vdash P \geqslant Q \rightsquigarrow t$. Let us consider the last rule applied to infer this judgment.

- **Case 1**. (VAR_{\leq}^{\sim}) Notice that $|\alpha^{-}| = \alpha$. Then $|\Theta|$; $\cdot \vdash \lambda x. x: \alpha \rightarrow \alpha$ immediately by (λ^{F}) and (VAR_{\leq}^{F}) .
- **Case 2**. (VAR[→]) This case is symmetric to the previous one.
- **Case 3.** (\uparrow^{\leadsto}) Notice that $|\uparrow P| = |P|$, and by induction hypothesis $\Theta \vdash Q \geqslant P \leadsto t$ implies $|\Theta|$; $\vdash t \colon |P| \to |Q|$.
- **Case** 4. (\downarrow^{\sim}) This case is symmetric to the previous one.

 Case 5. $(\to_{\leqslant}^{\leadsto})$ We need to show that $|\Theta|$; $\cdot \vdash \lambda x. \lambda y. t'(x(ty)): (|P| \to |N|) \to |Q| \to |M|$. By induction hypothesis applied to the premises, we know that $|\Theta|$; $\cdot \vdash t: |Q| \to |P|$ and $|\Theta|$; $\cdot \vdash t': |N| \to |M|$. Then the required typing judgment follows from standard rules of System F.

Case 6. $(\forall \overrightarrow{\circ})$ We need to show that $|\Theta|$; $\vdash \lambda x$. $\Lambda \overrightarrow{\beta}$. t x: $(\forall \overrightarrow{\alpha} . |N|) \to \forall \overrightarrow{\beta} . |M|$. By the induction hypothesis applied to the premise, we know that $|\Theta|$; $\vdash t$: $|[\sigma]N| \to |M|$, that we rewrite as $|\Theta|$; $\vdash t$: $|[\sigma|]|N| \to |M|$ by Observation 4. Then the required typing judgment follows from the standard rules of System F notice that $|\Theta|$, $\overrightarrow{\beta}$; $x : \forall \overrightarrow{\alpha} . |N| \vdash x$: $\forall \overrightarrow{\alpha} . |N|$ implies $|\Theta|$, $|\overrightarrow{\beta}|$; |X| : |X|

Case 7. $(\exists_{\geqslant}^{\sim})$ We need to show that $|\Theta|$; $\vdash \lambda x$. unpack $(\overrightarrow{\beta}, y) = x$; pack $(t \ y)$ as $\exists \overrightarrow{\alpha} . |P| : |\exists \overrightarrow{\beta} . Q| \rightarrow |\exists \overrightarrow{\alpha} . P|$. By definition, $|\exists \overrightarrow{\beta} . Q| \rightarrow |\exists \overrightarrow{\alpha} . P| = \exists \overrightarrow{\beta} . |Q| \rightarrow \exists \overrightarrow{\alpha} . |P|$. Then by applying (λ^F) and the admissible rules (Unpack^F) and (Pack^F), it suffices to show $|\Theta|$, $\overrightarrow{\beta}$; $y : |Q| \vdash (t \ y) : [|\sigma|]|P|$ and that $|\Theta|$, $\overrightarrow{\beta} \vdash |\sigma| : \overrightarrow{\alpha}$. The latter follows from Θ , $\overrightarrow{\beta} \vdash |\sigma| : \overrightarrow{\alpha}$. The former holds by (App^F) and the induction hypothesis applied to the premise $(|\Theta|; \vdash t : |Q| \rightarrow |[\sigma]P|)$, and by Observation 4, $|[\sigma]P| = [|\sigma|]|P|)$.

Lemma 53 (Soundness of F_{\exists}^{\pm} w.r.t. System F). A judgment inferred by F_{\exists}^{\pm} is derivable in System F.

+ If Θ ; $\Gamma \vdash \nu$: $P \rightsquigarrow t$ then $|\Theta|$; $|\Gamma| \vdash t$: |P|;

- if Θ ; $\Gamma \vdash c : N \leadsto t$ then $|\Theta|$; $|\Gamma| \vdash t : |N|$;
- if Θ ; $\Gamma \vdash N \bullet \overrightarrow{v} \implies M \rightsquigarrow e$; \overrightarrow{t} then $|\Theta|$; $|\Gamma|, x : |N| \vdash e(x\overrightarrow{t}) : |M|$.

Proof. We prove it by (mutual) induction on the derivation of Θ ; $\Gamma \vdash \nu : P \leadsto t$ and Θ ; $\Gamma \vdash c : N \leadsto t$

Case 1. $(\rightarrow \stackrel{\sim}{\bullet})$ Suppose that Θ ; $\Gamma \vdash Q \rightarrow N \bullet v$, $\overrightarrow{v} \implies M \rightsquigarrow e'$; e t, \overrightarrow{t} . Then we know

- Θ ; $\Gamma \vdash \nu$: $P \leadsto t$, and then by the induction hypothesis, $|\Theta|$; $|\Gamma| \vdash t$: |P|;
- $\Theta \vdash Q \geqslant P \leadsto e$, and then by the soundness of subtyping elaboration (Lemma 52), $|\Theta|$; $\vdash e : |P| \rightarrow |O|$;
- Θ ; $\Gamma \vdash N \bullet \overrightarrow{v} \implies M \rightsquigarrow e'$; \overrightarrow{t} , and then by the induction hypothesis, $|\Theta|$; $|\Gamma|$, $x : |N| \vdash e'(x\overrightarrow{t}) : |M|$.

We wish to show that $|\Theta|$; $|\Gamma|$, $f: |Q| \to |N| \vdash e'(f(et, \overrightarrow{t})): |M|$, that is $|\Theta|$; $|\Gamma|$, $f: |Q| \to |N| \vdash e'(f(et)\overrightarrow{t}): |M|$. By substitution applied to case 1, it suffices to show that $|\Theta|$; $|\Gamma|$, $|f: |Q| \to |N| \vdash f(et): |M|$, which is inferred by multiple applications of $(\mathsf{App}^\mathsf{F})$ to the judgments stated above.

Case 2. $(\forall \overset{\leadsto}{\bullet})$ Then we know that $\Theta; \Gamma \vdash \forall \overset{\rightharpoonup}{\alpha^+}, N \bullet \overrightarrow{v} \implies M \leadsto e; \overrightarrow{t}$, and by inversion: $\Theta; \Gamma \vdash [\sigma] N \bullet \overrightarrow{v} \implies M \leadsto e; \overrightarrow{t}$, where σ is a substitution from $\overset{\rightharpoonup}{\alpha^+}$ to Θ . By the induction hypothesis, we know that $|\Theta|; |\Gamma|, x : [|\sigma|] |N| \vdash e(x\overrightarrow{t}) : |M|$.

We wish to show that $|\Theta|$; $|\Gamma|$, $x: \forall \vec{\alpha}. |N| \vdash e(x\vec{t}): |M|$. To do that, we can modify the inference tree of $|\Theta|$; $|\Gamma|$, $x: [|\sigma|]|N| \vdash e(x\vec{t}): |M|$ to infer $|\Theta|$; $|\Gamma|$, $x: \forall \vec{\alpha}. |N| \vdash e(x\vec{t}): |M|$. The only thing we need to change is every time the inference asks for the type of x in the context (i.e., in the leaf rule (VAR^F)), we use the combination of (TApp^F) and (VAR^F) instead of only (VAR^F) to infer $|\Theta|$; $|\Gamma|$, $x: \forall \vec{\alpha}. |N| \vdash x: [|\sigma|]|N|$.

Case 3. $(\emptyset_{\bullet \Rightarrow})$ Then we know Θ ; $\Gamma \vdash N \bullet \Rightarrow N' \rightsquigarrow e$; \cdot . By inversion, we have $\Theta \vdash N' \leqslant N \rightsquigarrow e$, which by the soundness of subtyping elaboration (Lemma 52), means $|\Theta|$; $\cdot \vdash e : |N| \rightarrow |N'|$.

Then the desired $|\Theta|$; $|\Gamma|$, $x : |N| \vdash ex : |N'|$ follows from the standard rules of System F.

- **Case 4**. (VAR $^{\sim}$), which means we wish to prove that Θ ; $\Gamma \vdash x : P \leadsto x$ implies $|\Theta|$; $|\Gamma| \vdash x : |P|$. By inversion, $x : P \in \Gamma$, and thus, by definition of context depolarization, $x : |P| \in |\Gamma|$. Then by (VAR^F) , we infer $|\Theta|$; $|\Gamma| \vdash x : |P|$.
- **Case 5**. $(\{\}^{\leadsto})$ Then we know that Θ ; $\Gamma \vdash \{c\}$: $\downarrow N \leadsto t$ and by the inversion, Θ ; $\Gamma \vdash c : N \leadsto t$. Then the desired $|\Theta|$; $|\Gamma| \vdash t : |N|$ follows from the induction hypothesis.
- **Case 6**. (RET[→]) The proof is symmetric to the previous case.

- **Case** 7. (ANN $^{\hookrightarrow}$) Then we know that Θ ; $\Gamma \vdash (v : 0) : 0 \rightarrow et$ and by inversion:
 - Θ ; $\Gamma \vdash \nu : P \longrightarrow t$, and then by the induction hypothesis, $|\Theta|$; $|\Gamma| \vdash t : |P|$;
 - $\Theta \vdash Q \geqslant P \leadsto e$, and then by the soundness of subtyping elaboration (Lemma 52), $|\Theta|$; $\vdash e : |P| \to |Q|$.

The desired $|\Theta|$; $|\Gamma| \vdash et$: |Q| follows by (App^F) applied to the judgement stated above.

- **Case 8.** For (ANN_{-}^{\sim}) , (\simeq_{+}^{\sim}) and (\simeq_{-}^{\sim}) the proof is analogous to the previous case.
- **Case 9.** (λ^{\sim}) We know that Θ ; $\Gamma \vdash \lambda x : P$. $c : P \to N \leadsto \lambda x$. t and by inversion: Θ ; Γ , $x : P \vdash c : N \leadsto t$, then by the induction hypothesis, $|\Theta|$; $|\Gamma|$, $x : |P| \vdash t : |N|$. By applying (λ^{F}) to this judgment, we infer the desired $|\Theta|$; $|\Gamma| \vdash \lambda x$. $t : |P| \to |N|$.
- **Case 10.** (Λ^{\sim}) We know that $\Theta; \Gamma \vdash \Lambda \alpha^+$. $c: \forall \alpha^+$. $N \hookrightarrow \Lambda \alpha$. t and by inversion: $\Theta, \alpha^+; \Gamma \vdash c: N \leadsto t$, then by the induction hypothesis, $|\Theta|, \alpha; |\Gamma| \vdash t: |N|$. By applying (Λ^F) to this judgment, we infer $|\Theta|; |\Gamma| \vdash \Lambda \alpha$. $t: \forall \alpha$. |N|, that is $|\Theta|; |\Gamma| \vdash \Lambda \alpha$. $t: |\nabla \alpha^+, N|$.
- **Case 11.** (LET_C) We know that Θ ; $\Gamma \vdash \text{let } x : P = c$; $c' : N \rightarrow \text{let } x = (et)$; t' and by inversion:
 - Θ ; $\Gamma \vdash c: M \leadsto t$, and then by the induction hypothesis, $|\Theta|$; $|\Gamma| \vdash t: |M|$;

• $\Theta \vdash M \leq \uparrow P \rightsquigarrow e$, and then by the soundness of subtyping elaboration (Lemma 52), $|\Theta|$; $\vdash e : |M| \rightarrow |P|$;

• Θ ; Γ , $x : P \vdash c' : N \leadsto t'$, and then by the induction hypothesis, $|\Theta|$; $|\Gamma|$, $x : |P| \vdash t' : |N|$.

To infer $|\Theta|$; $|\Gamma| \vdash \text{let } x = (e\ t)$; t': |N|, we apply the admissible System F rule (Let^F). Both premises hold: $|\Theta|$; $|\Gamma| \vdash e\ t: |P|$ follows form (App^F), and $|\Theta|$; $|\Gamma|, x: |P| \vdash t': |N|$ holds as stated above.

Case 12. (LET $^{\sim}$) We know that Θ ; $\Gamma \vdash \text{let } x = v$; $c : N \sim \text{let } x = t$; t' and by inversion:

• Θ ; $\Gamma \vdash \nu$: $P \rightsquigarrow t$ implying $|\Theta|$; $|\Gamma| \vdash t$: |P|; and

4800 4801 4802 • Θ ; Γ , $x : P \vdash c : N \leadsto t'$ implying $|\Theta|$; $|\Gamma|$, $x : |P| \vdash t' : |N|$.

Then the desired $|\Theta|$; $|\Gamma| \vdash \text{let } x = t$; t' : |N| follows by the admissible System F rule (Let^F) applied to the judgments above.

Case 13. (LET $^{\sim}_{@}$) We know that Θ ; $\Gamma \vdash \text{let } x = v(\overrightarrow{v})$; $c : N \rightarrow \text{let } x = (e(t'\overrightarrow{t}))$; t and by inversion, in particular, we have:

- Θ ; $\Gamma \vdash \nu : \downarrow M \rightsquigarrow t'$, and then by the induction hypothesis, $|\Theta|$; $|\Gamma| \vdash t' : |M|$;
- Θ ; $\Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q \leadsto e$; \overrightarrow{t} , and then by the induction hypothesis, $|\Theta|$; $|\Gamma|, x : |M| \vdash e(x\overrightarrow{t}): |Q|$;
- Θ ; Γ , $x: Q \vdash c: N \leadsto t$, and then by the induction hypothesis, $|\Theta|$; $|\Gamma|$, |T|, |T| |T|

We wish to show that $|\Theta|$; $|\Gamma| \vdash \text{let } x = (e(t'\overrightarrow{t}))$; t: |N|. By applying (Let^F), we reduce this to $|\Theta|$; $|\Gamma| \vdash e(t'\overrightarrow{t})$: |Q|, which holds by substitution t' for x in $|\Theta|$; $|\Gamma|$, $x: |M| \vdash e(x\overrightarrow{t})$: |Q| (which is possible since $|\Theta|$; $|\Gamma| \vdash t' : |M|$).

Case 14. (LET $\overset{\leadsto}{:}$ By inversion of Θ ; $\Gamma \vdash \text{let } x : P = v(\overrightarrow{v})$; $c : N \leadsto \text{let } x = e'(e(t'\overrightarrow{t}))$; t, we know that

- Θ ; $\Gamma \vdash \nu : \downarrow M \rightsquigarrow t'$, and then by the induction hypothesis, $|\Theta|$; $|\Gamma| \vdash t' : |M|$;
- Θ ; $\Gamma \vdash M \bullet \overrightarrow{v} \implies M' \leadsto e$; \overrightarrow{t} , and then by the induction hypothesis, $|\Theta|$; $|\Gamma|, x : |M| \vdash e(x\overrightarrow{t}): |M'|$. By substitution, it implies $|\Theta|$; $|\Gamma| \vdash e(t'\overrightarrow{t}): |M'|$.
- $\Theta \vdash M' \leq \uparrow P \rightsquigarrow e'$, and then by the soundness of subtyping elaboration (Lemma 52), $|\Theta|$; $\vdash e' : |M'| \rightarrow |P|$;
- Θ ; Γ , $x: P \vdash c: N \rightarrow t$, and then by the induction hypothesis, $|\Theta|$; $|\Gamma|$, |T| |T|

To infer $|\Theta|$; $|\Gamma| \vdash \text{let } x = e'(e(t'\overrightarrow{t}))$; t: |N|, we apply (Let^F) , so it is left to show that $|\Theta|$; $|\Gamma| \vdash e'(e(t'\overrightarrow{t}))$: |P|, which follows from (App^F) and the judgments stated above.

Case 15. (LET $_{\exists}^{\leadsto}$) By inversion of Θ ; $\Gamma \vdash \text{let}^{\exists}(\overrightarrow{\alpha}, x) = v$; $c : N \leadsto \text{unpack}(\overrightarrow{\alpha}, x) = t$; t', we have:

• Θ ; $\Gamma \vdash \nu$: $\exists \overrightarrow{\alpha} \cdot P \rightarrow t$, and then by the induction hypothesis, $|\Theta|$; $|\Gamma| \vdash t$: $\exists \overrightarrow{\alpha} \cdot |P|$;

- Θ ; Γ , $x : P \vdash c : N \leadsto t'$, and then by the induction hypothesis, $|\Theta|$; $|\Gamma|$, $x : |P| \vdash t' : |N|$;
- $\Theta \vdash N$ implying $|\Theta| \vdash |N|$.

 To infer the desired $|\Theta|$; $|\Gamma| \vdash \text{unpack } (\overrightarrow{\alpha}, x) = t; t' : |N|$, we apply (Unpack^F): all its premises hold, as noted above.

Lemma 54 (*Polarization commutes with substitution*). $\lfloor [A/\alpha]T \rfloor = [\lfloor A \rfloor/\alpha^+] \lfloor T \rfloor$

Proof. We prove it by induction on *T*. Each congruent case is proven by congruent rewriting, and applying the induction hypothesis.

```
Case 1. T = \alpha. Then \lfloor [A/\alpha]T \rfloor = \lfloor [A/\alpha]\alpha \rfloor = \lfloor A \rfloor and \lceil \lfloor A \rfloor/\alpha^+ \rceil \rfloor T \rfloor = \lceil \lfloor A \rfloor/\alpha^+ \rceil \alpha^+ = \lfloor A \rfloor.
```

Case 2. $T = \alpha_0 \neq \alpha$. Then $\lfloor [A/\alpha]T \rfloor = \lfloor [A/\alpha]\alpha_0 \rfloor = \lfloor \alpha_0 \rfloor = \alpha_0^+$ and $\lfloor |A|/\alpha^+ \rfloor |T| = \lfloor |A|/\alpha^+ \rfloor \alpha_0^+ = \lfloor \alpha_0 \rfloor$.

Case 3. $T = B_1 \rightarrow B_1$. By the induction hypothesis, $\lfloor [A/\alpha]B_i \rfloor = \lfloor |A|/\alpha^+ \rfloor |B_i \rfloor$ for i = 1, 2. Then $\lfloor [A/\alpha]T \rfloor = \lfloor [A/\alpha](B_1 \rightarrow B_2) \rfloor = \lfloor [A/\alpha]B_1 \rightarrow [A/\alpha]B_2 \rfloor = \rfloor (\lfloor [A/\alpha]B_1 \rfloor \rightarrow \uparrow \lfloor [A/\alpha]B_2 \rfloor) = \lfloor [A/\alpha]B_2 \rfloor = \lfloor |A|/\alpha^+ \rfloor |B_1 \rfloor \rightarrow \uparrow \lfloor |A|/\alpha^+ \rfloor |B_2 \rfloor) = \lfloor |A|/\alpha^+ \rfloor |B_1 \rfloor \rightarrow \uparrow |B_2 \rfloor = \lfloor |A|/\alpha^+ \rfloor |B_1 \rfloor \rightarrow B_2 \rfloor = \lfloor |A|/\alpha^+ \rfloor |A$

Case 4. $T = \forall \alpha_0$. T_0 . By the induction hypothesis, $\lfloor [A/\alpha]T_0 \rfloor = \lfloor |A|/\alpha^+ \rfloor \rfloor T_0 \rfloor$. Then $\lfloor [A/\alpha]T_0 \rfloor = \lfloor [A/\alpha] \forall \alpha_0 . T_0 \rfloor = \lfloor \forall \alpha_0 . [A/\alpha]T_0 \rfloor = \lfloor \forall \alpha_0^+ . \uparrow [A/\alpha]T_0 \rfloor = \lfloor \forall \alpha_0^+ . \uparrow [A/\alpha]T_0 \rfloor = \lfloor |A|/\alpha^+ \rfloor \rfloor \forall \alpha_0^+ . \uparrow [A/\alpha]T_0 \rfloor = \lfloor |A|/\alpha^+ \rfloor \rfloor \forall \alpha_0^+ . \uparrow [A/\alpha]T_0 \rfloor = \lfloor |A|/\alpha^+ \rfloor \rfloor T_0 \rfloor = \lfloor |A|/\alpha^+ \rfloor \rfloor T_0 \rfloor$

Observation 5. For any Θ , Γ , t, and T, there exists c such that Θ ; $\Gamma \vdash t : T \rightsquigarrow^{\pm} c$ if and only if Θ ; $\Gamma \vdash t : T$.

Proof. We prove it separately in both directions of the implication.

The erasure of the computation is proved by induction on the derivation of Θ ; $\Gamma \vdash t : T \leadsto^{\pm} c$. Notice that the inference rules of Fig. 2 are obtained by removing the resulting computation from the judgement of the rules of Fig. 7.

The other direction is proved by straightforward induction on the typing derivation Θ ; $\Gamma \vdash t : T$.

Lemma 55 (*Type polarization agrees with well-formedness*). If $\Theta \vdash T$ then $|\Theta| \vdash |T|$.

Proof. We prove it by induction on $\Theta \vdash T$. Let us consider the last rule applied to infer this judgment, or, equivalently, the shape of $\Theta \vdash T$.

Case 1. $\Theta \vdash \alpha$. By inversion, $\alpha \in \Theta$, which implies $|\alpha| = \alpha^+ \in |\Theta|$. Then $|\Theta| \vdash |\alpha|$ by (VAR_+^{WF}) ;

, Vol. 1, No. 1, Article . Publication date: July 2024.

Case 2. $\Theta \vdash A \to B$. By inversion, $\Theta \vdash A$ and $\Theta \vdash B$, which by the induction hypothesis implies $|\Theta| \vdash |A|$ and $|\Theta| \vdash |B|$. Then $|\Theta| \vdash |A| \to |B| \to |A| \to |B|$ by (\downarrow^{WF}) , (\uparrow^{WF}) , and (\to^{WF}) ;

Case 3. $\Theta \vdash \forall \overrightarrow{\alpha}. T$. By inversion, $\Theta, \alpha \vdash T$, which by the induction hypothesis implies $\lfloor \Theta \rfloor, \alpha^+ \vdash \lfloor T \rfloor$. Then $\lfloor \Theta \rfloor \vdash \forall \alpha^+. \uparrow \rfloor T \rfloor = \lfloor \forall \alpha. T \rfloor$ by (\forall^{WF}) , and (\uparrow^{WF}) .

Lemma 56 (*Polarization preserves typing*). If Θ ; $\Gamma \vdash t : T \rightsquigarrow^{\pm} c$ then $|\Theta|$; $|\Gamma| \vdash c : \uparrow |T|$.

Proof. We prove it by induction on Θ ; $\Gamma \vdash t : T \rightsquigarrow^{\pm} c$. Let us consider the last rule applied to infer this judgment.

Case 1. (VAR $^{\diamond \pm}$), in which case we wish to prove that if Θ ; $\Gamma \vdash x : T \diamond^{\pm}$ return x then $\lfloor \Theta \rfloor$; $\lfloor \Gamma \rfloor \vdash \text{return } x : \uparrow \rfloor T \rfloor$.

By inversion of the given judgement, $x : T \in \Gamma$, and thus, $x : |T| \in |\Gamma|$. We apply (VAR^{INF}) to infer $|\Theta|$; $|\Gamma| \vdash x : |T|$, and then (RET^{INF}) to infer $|\Theta|$; $|\Gamma| \vdash r$ eturn $x : \uparrow |T|$.

Case 2. $(\lambda^{\hookrightarrow^{\pm}})$, in which case we wish to prove that if Θ ; $\Gamma \vdash \lambda x$. $t: A \to B \hookrightarrow^{\pm}$ return $\{\lambda x: |A| \cdot c\}$ then $|\Theta|$; $|\Gamma| \vdash$ return $\{\lambda x: |A| \cdot c\}: \uparrow |A \to B|$.

The premise of the given judgment is Θ ; Γ , $x:A \vdash t:B \rightarrow^{\pm} c$, which by the induction hypothesis implies $\lfloor \Theta \rfloor$; $\lfloor \Gamma$, $x:A \rfloor \vdash c: \uparrow \lfloor B \rfloor$, which we rewrite as $\lfloor \Theta \rfloor$; $\lfloor \Gamma \rfloor$, $x: \lfloor A \rfloor \vdash c: \uparrow \lfloor B \rfloor$. Also, the soundness of System F typing (together with Observation 5) imply that the inferred type $A \to B$ is well-formed in Θ , which means that $\lfloor A \rfloor$ is well-formed in $\lfloor \Theta \rfloor$ by Lemma 55. Then by (λ^{INF}) we infer $\lfloor \Theta \rfloor$; $\lfloor \Gamma \rfloor \vdash \lambda x: \lfloor A \rfloor \cdot c: \lfloor A \rfloor \to \uparrow \lfloor B \rfloor$, and then by ($\{\}^{\text{INF}}\}$) and ($\{\{\}^{\text{INF}}\}$), $\{\{\}\}^{\text{INF}}\}$ and ($\{\{\}\}^{\text{INF}}\}$), $\{\{\}\}^{\text{INF}}\}$ return $\{\{\}\}^{\text{INF}}\}$ ($\{\{\}\}\}^{\text{INF}}\}$), which can be rewritten to the required judgment since $\{\{\}\}\}$ by definition.

Case 3. $(\Lambda^{\hookrightarrow}^{\pm})$. The case is similar to the previous one. We wish to prove that if Θ ; $\Gamma \vdash \Lambda \alpha . t : \forall \alpha . T \leadsto^{\pm} \text{ return } \{\Lambda \alpha^{+} . c\}$ then $\lfloor \Theta \rfloor : \lfloor \Gamma \rfloor \vdash \text{ return } \{\Lambda \alpha^{+} . c\} : \uparrow \lfloor \forall \alpha . T \rfloor$.

By inversion of the given judgment, we have: Θ , α ; $\Gamma \vdash t : T \leadsto^{\pm} c$, and by the induction hypothesis, $|\Theta|$, α^{+} ; $|\Gamma| \vdash c : \uparrow |T|$,

Then we apply (Λ^{INF}) to infer $|\Theta|$; $|\Gamma| \vdash \Lambda \alpha^+$. $c \colon \forall \alpha^+ . \uparrow |T|$, and then $(\{\}^{\text{INF}})$ with $(\text{RET}^{\text{INF}})$ to infer $|\Theta|$; $|\Gamma| \vdash \text{return } \{\Lambda \alpha^+ . c\} \colon \uparrow \downarrow \forall \alpha^+ . \uparrow |T|$. Finally, notice that $|\nabla \alpha^+ . \uparrow |T| = |\nabla \alpha . T|$ by definition.

Case 4. $(App^{\rightarrow^{\pm}})$. By inversion of the given judgment, we have:

- Θ ; $\Gamma \vdash t: A \to B \leadsto^{\pm} c$, and by the induction hypothesis, $|\Theta|$; $|\Gamma| \vdash c: \uparrow |A \to B|$, which is equivalent to $|\Theta|$; $|\Gamma| \vdash c: \uparrow \downarrow (|A| \to \uparrow |B|)$.
- Θ ; $\Gamma \vdash t' : A \rightsquigarrow^{\pm} c'$, and by the induction hypothesis, $|\Theta|$; $|\Gamma| \vdash c' : \uparrow |A|$.

To infer $|\Theta|$; $|\Gamma| \vdash \text{let } f : |A \to B| = c$; |A| = c'; |A| = c'; |A| = f(x); return $y : \uparrow |B|$, we gradually apply the corresponding rules of |F| to construct the required typing inference tree:

- (1) $|\Theta|; |\Gamma|, f: \downarrow (|A| \rightarrow \uparrow |B|), x: |A|, y: |B| \vdash \text{return } y: \uparrow |B| \text{ by } (\text{VAR}^{\text{INF}}) \text{ and } (\text{RET}^{\text{INF}}).$
- (2) $\[|\Theta| \] \[|\Gamma| \] \[f : \downarrow (|A| \to \uparrow |B|), x : |A| + \text{let } y : |B| = f(x); \text{ return } y : \uparrow |B| \]$ by $(\text{LET}^{\text{INF}}_{:\Theta})$. Let us show that the required premises hold.
 - (a) $|\Theta| + |B|$ by Lemma 55;

- (b) $\lfloor \Theta \rfloor$; $\lfloor \Gamma \rfloor$, $f : \rfloor (\lfloor A \rfloor \rightarrow \uparrow \lfloor B \rfloor)$, $x : \lfloor A \rfloor \vdash f : \rfloor (\lfloor A \rfloor \rightarrow \uparrow \lfloor B \rfloor)$ by (VAR^{INF}) ;
- (c) $\lfloor \Theta \rfloor : \lfloor \Gamma \rfloor, f : \rfloor (\lfloor A \rfloor \to \uparrow \lfloor B \rfloor), x : \lfloor A \rfloor \vdash (\lfloor A \rfloor \to \uparrow \lfloor B \rfloor) \bullet x \Longrightarrow \uparrow \lfloor B \rfloor \text{ by } (\to_{\bullet \to}^{\text{INF}})$
- (d) $|\Theta| + \uparrow |B| \le \uparrow |B|$ by reflexivity (Lemma 22);
- (e) $\lfloor \Theta \rfloor$; $\lfloor \Gamma \rfloor$, $f : \downarrow (\lfloor A \rfloor \rightarrow \uparrow \lfloor B \rfloor)$, $x : \lfloor A \rfloor$, $y : \lfloor B \rfloor \vdash \text{return } y : \uparrow \lfloor B \rfloor \text{ as noted above;}$
- (3) $|\Theta|$; $|\Gamma|$, $f: |(|A| \to \uparrow |B|) \vdash \text{let } x: |A| = c'; \text{ let } y: |B| = f(x); \text{ return } y: \uparrow |B|$ by (LET^{INF}). Let us show that the required premises hold.
 - (a) $|\Theta| + |A|$ by Lemma 55;
 - (b) $\lfloor \Theta \rfloor$; $\lfloor \Gamma \rfloor$, $f: \downarrow (\lfloor A \rfloor \rightarrow \uparrow \lfloor B \rfloor) \vdash c': \uparrow \lfloor A \rfloor$ holds by weakening of $\lfloor \Theta \rfloor$; $\lfloor \Gamma \rfloor \vdash c': \uparrow \lfloor A \rfloor$, which in turn holds by the induction hypothesis, as noted above;
 - (c) $\lfloor \Theta \rfloor + \uparrow \lfloor A \rfloor \leqslant \uparrow \lfloor A \rfloor$ by reflexivity (Lemma 22);
 - (d) $\lfloor \Theta \rfloor$; $\lfloor \Gamma \rfloor$, $f: \rfloor (\lfloor A \rfloor \to \uparrow \rfloor B \rfloor)$, $x: \lfloor A \rfloor \vdash \text{let } y: \lfloor B \rfloor = f(x)$; return $y: \uparrow \rfloor B \rfloor$ as noted above;
- (4) $|\Theta|$; $|\Gamma| + \text{let } f : |A \to B| = c$; |let x : |A| = c'; |let y : |B| = f(x); return $y : \uparrow |B|$ by (LET^{INF}_C). Let us show that the required premises hold.
 - (a) $|\Theta| + |A| \rightarrow B|$ by Lemma 55;
 - (b) $|\Theta|$; $|\Gamma| \vdash c: \uparrow |A \rightarrow B|$ by the induction hypothesis, as noted above;
 - (c) $|\Theta| + \uparrow |A \rightarrow B| \leq \uparrow |A \rightarrow B|$ by reflexivity (Lemma 22);
 - (d) $|\Theta|$; $|\Gamma|$, $f: \downarrow (|A| \to \uparrow |B|) \vdash \text{let } x: |A| = c'; \text{let } y: |B| = f(x); \text{ return } y: \uparrow |B|$ as noted above (we rewrote $|A \to B|$ as $\downarrow (|A| \to \uparrow |B|))$.

Case 5. (TApp $^{\sim \pm}$) By inversion of this rule, we have

- Θ ; $\Gamma \vdash t : \forall \alpha. T \rightsquigarrow^{\pm} c$, and thus, $|\Theta|$; $|\Gamma| \vdash c : \uparrow |\forall \alpha. T|$ by the induction hypothesis; and
- $\Theta \vdash A$, which implies $\lfloor \Theta \rfloor \vdash \lfloor A \rfloor$ by Lemma 55.

We wish to infer $|\Theta|$; $|\Gamma| \vdash \text{let } f : |\forall \alpha. T| = c$; $\text{let } y : |[A/\alpha]T| = f()$; $\text{return } y : \uparrow |[A/\alpha]T|$. First, let us rewrite the polarized types by definition and Lemma 54: $|\Theta|$; $|\Gamma| \vdash \text{let } f : |\forall \alpha^+. \uparrow |T| = c$; $|\Phi| : |A|/\alpha^+| |T| = f()$; $|\Phi| : |A|/\alpha^+| |T|$. Then we prove this judgment gradually by applying the corresponding rules of $|\Phi| : |\Phi|$.

- (1) $|\Theta|; |\Gamma|, f : |\forall \alpha^+, \uparrow |T|, y : [|A|/\alpha^+] |T| + \text{return } y : \uparrow [|A|/\alpha^+] |T| \text{ holds by } (VAR^{INF}) \text{ and } (\text{RET}^{INF}).$
- (2) $|\Theta|$; $|\Gamma|$, $f: \forall \alpha^+$. $\uparrow |T| \vdash \text{let } y: [|A|/\alpha^+] |T| = f()$; return $y: \uparrow [|A|/\alpha^+] |T|$ holds by $(\text{LET}_{:@}^{\text{INF}})$. Let us show that the required premises hold.
 - (a) $|\Theta| + [|A|/\alpha^+] |T|$ holds since $|\Theta| + |A|$ and $|\Theta| + |T|$ by Lemma 5.
 - (b) $\lfloor \Theta \rfloor$; $\lfloor \Gamma \rfloor$, $f : \bigcup \forall \alpha^+$. $\uparrow \rfloor T \rfloor \vdash f : \bigcup \forall \alpha^+$. $\uparrow \rfloor T \rfloor$ by (VAR^{INF}) .
 - (c) $\lfloor \Theta \rfloor : \lfloor \Gamma \rfloor, f : \rfloor \forall \alpha^+, \uparrow \rfloor T \rfloor \vdash \forall \alpha^+, \uparrow \rfloor T \rfloor \bullet \implies \forall \alpha^+, \uparrow \rfloor T \rfloor \text{ by } (\emptyset_{\bullet \rightarrow}^{\text{INF}}).$
 - (d) $|\Theta| \vdash \forall \alpha^+ . \uparrow |T| \le \uparrow [|A|/\alpha^+] |T| \text{ by } (\forall^{\leq}): |\Theta| \vdash |A|/\alpha^+ : \alpha^+ \text{ since } |\Theta| \vdash |A|,$ as noted above.
 - (e) $|\Theta|$; $|\Gamma|$, $f: |\nabla \alpha^+|$, $|\Gamma|$, $y: [|A|/\alpha^+]$, |T| $|\Gamma|$ return $y: |[|A|/\alpha^+]$, |T| as noted above.
- (3) $|\Theta|$; $|\Gamma| \vdash \text{let } f: \forall \alpha^+ . \uparrow |T| = c$; $|\text{let } y: [|A|/\alpha^+]|T| = f()$; return $y: \uparrow [|A|/\alpha^+]|T|$ holds by $(\text{LET}_C^{\text{INF}})$. Let us show that the required premises hold.
 - (a) $\lfloor \Theta \rfloor \vdash \rfloor \forall \alpha^+ . \uparrow \rfloor T \rfloor$ by Lemma 55.
 - (b) $|\Theta|$; $|\Gamma| + c$: $\uparrow \downarrow \forall \alpha^+$. $\uparrow \downarrow T \downarrow$ by the induction hypothesis, as noted above.
 - (c) $\lfloor \Theta \rfloor \vdash \uparrow \rfloor \forall \alpha^+ . \uparrow \rfloor T \rfloor \leqslant \uparrow \rfloor \forall \alpha^+ . \uparrow \rfloor T \rfloor$ by reflexivity (Lemma 22).
 - (d) $|\Theta|; |\Gamma|, f: |\forall \alpha^+, \uparrow|T| + \text{let } y: [|A|/\alpha^+]|T| = f(); \text{ return } y: \uparrow [|A|/\alpha^+]|T| \text{ as noted above.}$

3.3 Algorithmic Types

3.3.1 Algorithmic Type Well-formedness.

Lemma 58 (Soundness of algorithmic type well-formedness).

- + if Θ ; $\widehat{\Theta} \vdash P$ then fv $(P) \subseteq \Theta$ and fav $(P) \subseteq \widehat{\Theta}$;
- $\text{ if } \Theta ; \widehat{\Theta} \vdash N \text{ then fv } (N) \subseteq \Theta \text{ and fav}(N) \subseteq \widehat{\Theta}.$

, Vol. 1, No. 1, Article . Publication date: July 2024.

Proof. The proof is analogous to Lemma 3. The additional base case is when Θ ; $\widehat{\Theta} \vdash P$ is derived by $(UVAR_+^{WF})$, and the symmetric negative case. In this case, $P = \widehat{\alpha}^+$, and $fav(P) = \widehat{\alpha}^+ \subseteq \widehat{\Theta}$ by inversion; $fv(P) = \emptyset \subseteq \Theta$ vacuously.

Lemma 59 (*Completeness of algorithmic type well-formedness*). In the well-formedness judgment, only used variables matter:

- + if $\Theta_1 \cap \text{fv } P = \Theta_2 \cap \text{fv } P$ and $\widehat{\Theta}_1 \cap \text{fav}(P) = \widehat{\Theta}_2 \cap \text{fav}(P)$ then $\Theta_1; \widehat{\Theta}_1 \vdash P \iff \Theta_2; \widehat{\Theta}_2 \vdash P$, and
- $\text{ if } \Theta_1 \cap \text{fv } N = \Theta_2 \cap \text{fv } N \text{ and } \widehat{\Theta}_1 \cap \text{fav}(\underline{N}) = \widehat{\Theta}_2 \cap \text{fav}(\underline{N}) \text{ then } \Theta_1; \widehat{\Theta}_1 \vdash \underline{N} \iff \Theta_2; \widehat{\Theta}_2 \vdash \underline{N}.$

Proof. By mutual structural induction on P and N.

 Lemma 60 (Variable algorithmization agrees with well-formedness).

- $+\Theta, \overrightarrow{\alpha} \vdash P \text{ implies } \Theta; \overrightarrow{\widehat{\alpha}} \vdash [\overrightarrow{\widehat{\alpha}} / \overrightarrow{\alpha}]P;$
- $-\Theta, \overrightarrow{\alpha} \vdash N \text{ implies } \Theta; \overrightarrow{\widehat{\alpha}} \vdash [\overrightarrow{\widehat{\alpha}} / \overrightarrow{\alpha}] N.$

Proof. The proof is a structural induction on Θ , $\overrightarrow{\alpha} \vdash P$ and mutually, on Θ , $\overrightarrow{\alpha} \vdash N$. Notice that the substitutions commute with all the constructors, providing the step of the induction.

Lemma 61 (Variable de-algorithmization agrees with well-formedness).

- $+\Theta; \overrightarrow{\widehat{\alpha}} \vdash P \text{ implies } \Theta, \overrightarrow{\alpha} \vdash [\overrightarrow{\alpha} \not \cap \overrightarrow{\widehat{\alpha}}]P;$
- $-\Theta$; $\overrightarrow{\widehat{\alpha}} \vdash N$ implies Θ , $\overrightarrow{\alpha} \vdash [\overrightarrow{\alpha} / \overrightarrow{\widehat{\alpha}}]N$.

Proof. As for Lemma 60, the proof is a structural induction on Θ ; $\widehat{\alpha}^{-} \vdash P$ and mutually, on Θ ; $\widehat{\alpha}^{-} \vdash N$.

Corollary 22 (Well-formedness Algorithmic Context Weakening). Suppose that $\Theta_1 \subseteq \Theta_2$, and $\widehat{\Theta}_1 \subseteq \widehat{\Theta}_2$. Then

- + if Θ_1 ; $\widehat{\Theta}_1 \vdash P$ implies Θ_2 ; $\widehat{\Theta}_2 \vdash P$,
- if Θ_1 ; $\widehat{\Theta}_1 \vdash N$ implies Θ_2 ; $\widehat{\Theta}_2 \vdash N$.

Proof. By Lemma 58, Θ_1 ; $\widehat{\Theta}_1 \vdash P$ implies $\mathsf{fv}(P) \subseteq \Theta_1 \subseteq \Theta_2$ and $\mathsf{fav}(P) \subseteq \widehat{\Theta}_1 \subseteq \widehat{\Theta}_2$, and thus, $\mathsf{fv}(P) = \mathsf{fv}(P) \cap \Theta_1 = \mathsf{fv}(P) \cap \Theta_2$, and $\mathsf{fav}(P) = \mathsf{fav}(P) \cap \widehat{\Theta}_1 = \mathsf{fav}(P) \cap \widehat{\Theta}_2$. Then by Lemma 59, Θ_2 ; $\widehat{\Theta}_2 \vdash P$. The negative case is symmetric.

3.3.2 Substitution.

Lemma 63 (Algorithmic Substitution Strengthening). Restricting the substitution to the algorithmic variables of the substitution subject does not affect the result. Suppose that $\widehat{\sigma}$ is an algorithmic substitution, \underline{P} and \underline{N} are algorithmic types. Then

- + $[\widehat{\sigma}]P = [\widehat{\sigma}|_{\mathsf{fav}(P)}]P$,
- $[\widehat{\sigma}] N = [\widehat{\sigma}|_{\mathsf{fav}(N)}] N$

 Proof. The proof is analogous to the proof of Lemma 6.

Lemma 64 (Substitutions equal on the algorithmic variables). Suppose that $\widehat{\sigma}_1$ and $\widehat{\sigma}_2$ are normalized substitutions of signature $\Xi \vdash \widehat{\sigma}_i : \widehat{\Theta}$. Then

- + for a normalized type Θ ; $\widehat{\Theta} \vdash P$, if $[\widehat{\sigma}_1]P = [\widehat{\sigma}_2]P$ then $\widehat{\sigma}_1|_{(fav(P))} = \widehat{\sigma}_2|_{(fav(P))}$;
- for a normalized type Θ ; $\widehat{\Theta} \vdash N$, if $[\widehat{\sigma}_1]N = [\widehat{\sigma}_2]N$ then $\widehat{\sigma}_1|_{(\mathsf{fav}(N))} = \widehat{\sigma}_2|_{(\mathsf{fav}(N))}$.

Proof. The proof is a simple structural induction on Θ ; $\widehat{\Theta} \vdash P$ and mutually, on Θ ; $\widehat{\Theta} \vdash N$. Let us consider the shape of N (the cases of P are symmetric).

- **Case 1.** Θ ; $\widehat{\Theta} \vdash \widehat{\alpha}^-$. Then $[\widehat{\sigma}_1]\widehat{\alpha}^- = [\widehat{\sigma}_2]\widehat{\alpha}^-$ implies $\widehat{\sigma}_1|_{(\mathsf{fav}(\widehat{\alpha}^-))} = \widehat{\sigma}_2|_{(\mathsf{fav}(\widehat{\alpha}^-))}$ immediately.
- Case 2. Θ ; $\widehat{\Theta} \vdash \alpha^-$. Then $fav(\widehat{\alpha}^-) = \emptyset$, and $\widehat{\sigma}_1|_{(fav(\widehat{\alpha}^-))} = \widehat{\sigma}_2|_{(fav(\widehat{\alpha}^-))}$ holds vacuously.
- Case 3. Θ ; $\widehat{\Theta} \vdash \forall \alpha^{+}$. N. Then we are proving that $[\widehat{\sigma}_{1}] \forall \alpha^{+}$. $N = [\widehat{\sigma}_{2}] \forall \alpha^{+}$. N implies $\widehat{\sigma}_{1}|_{(\mathsf{fav}(\forall \alpha^{-1}, N))} = \widehat{\sigma}_{2}|_{(\mathsf{fav}(\nabla \alpha^{-1}, N))}$. By definition of substitution and $(\forall^{\simeq^{D}})$, $[\widehat{\sigma}_{1}] N = [\widehat{\sigma}_{2}] N$ implies $\widehat{\sigma}_{1}|_{\mathsf{fav}(N)} = \widehat{\sigma}_{2}|_{\mathsf{fav}(N)}$. Since $\forall \alpha^{-1}$. N is normalized, so is Θ , α^{-1} ; $\widehat{\Theta} \vdash N$, hence, the induction hypothesis is applicable and implies $\widehat{\sigma}_{1}|_{\mathsf{fav}(N)} = \widehat{\sigma}_{2}|_{\mathsf{fav}(N)}$, as required.
- Case 4. Θ ; $\widehat{\Theta} \vdash P \to N$. Then we are proving that $[\widehat{\sigma}_1](P \to N) = [\widehat{\sigma}_2](P \to N)$ implies $\widehat{\sigma}_1|_{(\mathsf{fav}(P \to N))} = \widehat{\sigma}_2|_{(\mathsf{fav}(P \to N))}$. By definition of substitution and congruence of equality, $[\widehat{\sigma}_1](P \to N) = [\widehat{\sigma}_2](P \to N)$ means $[\widehat{\sigma}_1]P = [\widehat{\sigma}_2]P$ and $[\widehat{\sigma}_1]N = [\widehat{\sigma}_2]N$. Notice that P and N are normalized since $P \to N$ is normalized, and well-formed in the same contexts. This way, by the induction hypothesis, $\widehat{\sigma}_1|_{(\mathsf{fav}(P))} = \widehat{\sigma}_2|_{(\mathsf{fav}(P))}$ and $\widehat{\sigma}_1|_{(\mathsf{fav}(P))} = \widehat{\sigma}_2|_{(\mathsf{fav}(P))}$, which since $\mathsf{fav}(P \to N) = \mathsf{fav}(P) \cup \mathsf{fav}(N)$ implies $\widehat{\sigma}_1|_{(\mathsf{fav}(P \to N))} = \widehat{\sigma}_2|_{(\mathsf{fav}(P \to N))}$.
- Case 5. Θ ; $\widehat{\Theta} \vdash \uparrow P$. The proof is similar to the previous case: we apply congruence of substitution, equality, and normalization, then the induction hypothesis, and then the fact that $fav(\uparrow P) = fav(P)$.

Corollary 23 (Substitutions equivalent on the algorithmic variables). Suppose that $\widehat{\sigma}_1$ and $\widehat{\sigma}_2$ are substitutions of signature $\Xi \vdash \widehat{\sigma}_i : \widehat{\Theta}$ where $\Theta \vdash^{\supseteq} \Xi$. Then

- + for a type Θ ; $\widehat{\Theta} \vdash \mathbf{P}$, if $\Theta \vdash [\widehat{\sigma}_1] \mathbf{P} \simeq^{\leqslant} [\widehat{\sigma}_2] \mathbf{P}$ then $\Xi \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : \mathsf{fav}(\mathbf{P})$;
- for a type Θ ; $\widehat{\Theta} \vdash N$, if $\Theta \vdash [\widehat{\sigma}_1] N \simeq^{\leqslant} [\widehat{\sigma}_2] N$ then $\Xi \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2$: fav(N).

Proof. First, let us normalize the types and the substitutions, and show that the given equivalences and well-formedness properties are preserved. Θ ; $\widehat{\Theta} \vdash P$ implies Θ ; $\widehat{\Theta} \vdash nf$ (P) by Corollary 24. $\Theta \vdash$

 $[\widehat{\sigma}_1] P \simeq^{\epsilon} [\widehat{\sigma}_2] P$ implies $\operatorname{nf}([\widehat{\sigma}_1] P) = \operatorname{nf}([\widehat{\sigma}_2] P)$ by Lemma 48. Then $\operatorname{nf}([\widehat{\sigma}_1] P) = \operatorname{nf}([\widehat{\sigma}_2] P)$ 5098 implies $[\operatorname{nf}(\widehat{\sigma}_1)] \operatorname{nf}(P) = [\operatorname{nf}(\widehat{\sigma}_2)] \operatorname{nf}(P)$ by Lemma 43. Notice that by Corollary 25 $\Xi \vdash \widehat{\sigma}_i : \widehat{\Theta}$ 5099 implies $\Xi \vdash \operatorname{nf}(\widehat{\sigma}_i) : \widehat{\Theta}$.

This way, by Lemma 64, $\Theta \vdash [\widehat{\sigma}_1] P \simeq^{\epsilon} [\widehat{\sigma}_2] P$ implies $\inf (\widehat{\sigma}_1)|_{(\mathsf{fav}(\mathsf{nf}(P)))} = \inf (\widehat{\sigma}_2)|_{(\mathsf{fav}(\mathsf{nf}(P)))}$. Then by Lemma 66, $\inf (\widehat{\sigma}_1)|_{(\mathsf{fav}(P))} = \inf (\widehat{\sigma}_2)|_{(\mathsf{fav}(P))}$, and by Corollary 26, $\Xi \vdash \widehat{\sigma}_1 \simeq^{\epsilon} \widehat{\sigma}_2 : \mathsf{fav}(P)$.

Symmetrically,
$$\Theta \vdash [\widehat{\sigma}_1] N \simeq^{\leqslant} [\widehat{\sigma}_2] N$$
 implies $\Xi \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : \mathsf{fav}(N)$.

3.3.3 Normalization.

 Lemma 66 (Algorithmic variables are not changed by the normalization).

 $\begin{array}{cc} 5111 & - \mathsf{fav}(N) \equiv \mathsf{fav}(\mathsf{nf}(N)) \\ 5112 & \end{array}$

+ $fav(\underline{P}) \equiv fav(nf(\underline{P}))$

Proof. By straightforward induction on N and mutually on P, similar to the proof of Lemma 40.

Lemma 67 (Soundness of normalization of algorithmic types).

- $-N \simeq^D \mathsf{nf}(N)$
- + $P \simeq^D \operatorname{nf}(P)$

Proof. The proof coincides with the proof of Lemma 41.

3.3.4 Equivalence.

Lemma 68 (Algorithmic type well-formedness is invariant under equivalence). Mutual subtyping implies declarative equivalence.

- $+ \text{ if } \underline{\textbf{\textit{P}}} \simeq^D \underline{\textbf{\textit{Q}}} \text{ then } \Theta \text{ ; } \widehat{\Theta} \vdash \underline{\textbf{\textit{P}}} \iff \Theta \text{ ; } \widehat{\Theta} \vdash \underline{\textbf{\textit{Q}}},$
- if $N \simeq^D M$ then $\Theta : \widehat{\Theta} \vdash N \iff \Theta : \widehat{\Theta} \vdash M$

Proof. The proof coincides with the proof of Lemma 28, and adds two cases for equating two positive or two negative algorithmic variables, which must be equal by inversion, and thus, $\Theta : \widehat{\Theta} \vdash \widehat{\alpha}^{\pm} \iff \Theta : \widehat{\Theta} \vdash \widehat{\alpha}^{\pm} \text{ holds trivially.}$

Corollary 24 (Normalization preserves well-formedness of algorithmic types). $+ \Theta; \widehat{\Theta} \vdash P \iff \Theta; \widehat{\Theta} \vdash \mathsf{nf}(P),$

 $- \ \Theta \ ; \widehat{\Theta} \vdash \underline{N} \ \Longleftrightarrow \ \Theta \ ; \widehat{\Theta} \vdash \mathsf{nf} \ (\underline{N})$

Proof. Immediately from Lemmas 67 and 68.

 Corollary 25 (Normalization preserves the signature of the algorithmic substitution). $\Xi \vdash \widehat{\sigma}$: $\widehat{\Theta} \iff \Xi \vdash \mathsf{nf}(\widehat{\sigma}) : \widehat{\Theta}, \; \Theta \vdash \widehat{\sigma} : \widehat{\Theta} \iff \Theta \vdash \mathsf{nf}(\widehat{\sigma}) : \widehat{\Theta}.$

Proof. The proof is analogous to Corollary 15.

Corollary 26 (Algorithmic substitution equivalence becomes equality after normalization). Suppose that $\Xi \vdash \widehat{\sigma}_1 : \widehat{\Theta}'$ and $\Xi \vdash \widehat{\sigma}_2 : \widehat{\Theta}'$ are algorithmic substitutions and $\widehat{\Theta} \subseteq \widehat{\Theta}'$. Then $\Xi \vdash \widehat{\sigma}_1 \simeq^{\epsilon} \widehat{\sigma}_2 : \widehat{\Theta} \iff \inf (\widehat{\sigma}_1)|_{\widehat{\Theta}} = \inf (\widehat{\sigma}_2)|_{\widehat{\Theta}}$.

Proof. Follows immediately from Lemma 48:

- $\Rightarrow \text{ If } \widehat{\alpha}^{\pm} \notin \widehat{\Theta}, \text{ then } [\mathsf{nf}(\widehat{\sigma}_1)|_{\widehat{\Theta}}] \widehat{\alpha}^{\pm} = [\mathsf{nf}(\widehat{\sigma}_2)|_{\widehat{\Theta}}] \widehat{\alpha}^{\pm} = \widehat{\alpha}^{\pm} \text{ by definition. For any } \widehat{\alpha}^{\pm} \in \widehat{\Theta}, \\ [\mathsf{nf}(\widehat{\sigma}_1)|_{\widehat{\Theta}}] \widehat{\alpha}^{\pm} = \mathsf{nf}([\widehat{\sigma}_1]\widehat{\alpha}^{\pm}) \text{ and } [\mathsf{nf}(\widehat{\sigma}_2)|_{\widehat{\Theta}}] \widehat{\alpha}^{\pm} = \mathsf{nf}([\widehat{\sigma}_2]\widehat{\alpha}^{\pm}); \Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}_1] \widehat{\alpha}^{\pm} \simeq^{\epsilon} [\widehat{\sigma}_2] \widehat{\alpha}^{\pm} \\ \text{implies nf}([\widehat{\sigma}_1]\widehat{\alpha}^{\pm}) = \mathsf{nf}([\widehat{\sigma}_2]\widehat{\alpha}^{\pm}) \text{ by Lemma 45.}$
- $\Leftarrow \text{ If } \widehat{\alpha}^{\pm} \in \widehat{\Theta}, \text{ then nf } (\widehat{\sigma}_1)|_{\widehat{\Theta}} = \text{nf } (\widehat{\sigma}_2)|_{\widehat{\Theta}} \text{ implies nf } ([\widehat{\sigma}_1]\widehat{\alpha}^{\pm}) = \text{nf } ([\widehat{\sigma}_2]\widehat{\alpha}^{\pm}) \text{ by definition of substitution restriction and normalization. In turn, nf } ([\widehat{\sigma}_1]\widehat{\alpha}^{\pm}) = \text{nf } ([\widehat{\sigma}_2]\widehat{\alpha}^{\pm}) \text{ means } \Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}_1]\widehat{\alpha}^{\pm} \simeq^{\varsigma} [\widehat{\sigma}_2]\widehat{\alpha}^{\pm} \text{ by Lemma 45.}$

3.3.5 Unification Constraint Merge.

Observation 6 (*Unification Constraint Merge Determinism*). Suppose that $\Xi \vdash UC_1$ and $\Xi \vdash UC_2$ If $\Xi \vdash UC_1 \& UC_2 = UC$ and $\Xi \vdash UC_1 \& UC_2 = UC'$ are defined then UC = UC'.

Proof. UC and UC' both consists of three parts: Entries of UC_1 that do not have matching entries in UC_2 , entries of UC_2 that do not have matching entries in UC_1 , and the merge of matching entries.

The parts corresponding to unmatched entries of UC_1 and UC_2 coincide, since UC_1 and UC_2 are fixed. To show that the merge of matching entries coincide, let us take any pair of matching $ue_1 \in UC_1$ and $ue_2 \in UC_2$ and consider their shape.

Case 1. ue_1 is $\widehat{\alpha}^+ := Q_1$ and ue_2 is $\widehat{\alpha}^+ := Q_2$ then the result, if it exists, is always ue_1 , by inversion of $(= \&^+ =)$.

Case 2. ue_1 is $\widehat{\alpha}^- :\simeq N_1$ and ue_2 is $\widehat{\alpha}^- :\simeq N_2$ then analogously, the result, if it exists, is always ue_1 , by inversion of $(\simeq \&^- \simeq)$.

This way, the third group of entries coincide as well.

Lemma 69 (Soundness of Unification Constraint Merge). Suppose that $\Xi \vdash UC_1$ and $\Xi \vdash UC_2$ are normalized unification constraints. If $\Xi \vdash UC_1$ & $UC_2 = UC$ is defined then $UC = UC_1 \cup UC_2$.

Proof.

• $UC_1 \& UC_2 \subseteq UC_1 \cup UC_2$ By definition, $UC_1 \& UC_2$ consists of three parts: entries of UC_1 that do not have matching

, Vol. 1, No. 1, Article . Publication date: July 2024.

entries of UC_2 , entries of UC_2 that do not have matching entries of UC_1 , and the merge of matching entries.

If ue is from the first or the second part, then $ue \in UC_1 \cup UC_2$ holds immediately. If ue is from the third part, then ue is the merge of two matching entries $ue_1 \in UC_1$ and $ue_2 \in UC_2$. Since UC_1 and UC_2 are normalized unification, ue_1 and ue_2 have one of the following forms:

- $-\widehat{\alpha}^+:\simeq P_1$ and $\widehat{\alpha}^+:\simeq P_2$, where P_1 and P_2 are normalized, and then since $\Xi(\widehat{\alpha}^+) \vdash ue_1 \& ue_2 = ue$ exists, $(\simeq \&^+ \simeq)$ was applied to infer it. It means that $ue = ue_1 = ue_2$;
- $-\widehat{\alpha}^-:\simeq N_1$ and $\widehat{\alpha}^-:\simeq N_2$, then symmetrically, $\Xi(\widehat{\alpha}^-)\vdash ue_1 \& ue_2=ue=ue_1=ue_2$

In both cases, $ue \in UC_1 \cup UC_2$.

- $UC_1 \cup UC_2 \subseteq UC_1 \& UC_2$ Let us take an arbitrary $ue_1 \in UC_1$. Then since UC_1 is a unification constraint, ue_1 has one of the following forms:
 - $-\widehat{\alpha}^+$: ≃ P where P is normalized. If $\widehat{\alpha}^+ \notin \text{dom}(UC_2)$, then $ue_1 \in UC_1 \& UC_2$. Otherwise, there is a normalized matching $ue_2 = (\widehat{\alpha}^+ : \cong P') \in UC_2$ and then since $UC_1 \& UC_2$ exists, ($\cong \&^+ \cong$) was applied to construct $ue_1 \& ue_2 \in UC_1 \& UC_2$. By inversion of ($\cong \&^+ \cong$), $ue_1 \& ue_2 = ue_1$, and nf (P) = nf (P'), which since P and P' are normalized, implies that P = P', that is $ue_1 = ue_2 \in UC_1 \& UC_2$.
 - $\widehat{\alpha}^-$:≃ *N* where *N* is normalized. Then symmetrically, $ue_1 = ue_2 \in UC_1 \& UC_2$.

Similarly, if we take an arbitrary $ue_2 \in UC_2$, then $ue_1 = ue_2 \in UC_1 \& UC_2$.

Corollary 27. Suppose that $\Xi \vdash UC_1$ and $\Xi \vdash UC_2$ are normalized unification constraints. If $\Xi \vdash UC_1 \& UC_2 = UC$ is defined then

- (1) $\Xi \vdash UC$ is normalized unification constraint,
- (2) for any substitution $\Xi \vdash \widehat{\sigma} : \mathsf{dom}(UC), \Xi \vdash \widehat{\sigma} : UC \text{ implies } \Xi \vdash \widehat{\sigma} : UC_1 \text{ and } \Xi \vdash \widehat{\sigma} : UC_2.$

Proof. It is clear that since $UC = UC_1 \cup UC_2$ (by Lemma 69), and being normalized means that all entries are normalized, UC is a normalized unification constraint. Analogously, $\Xi \vdash UC = UC_1 \cup UC_2$ holds immediately, since $\Xi \vdash UC_1$ and $\Xi \vdash UC_2$.

Let us take an arbitrary substitution $\Xi \vdash \widehat{\sigma} : \text{dom}(UC)$ and assume that $\Xi \vdash \widehat{\sigma} : UC$. Then $\Xi \vdash \widehat{\sigma} : UC_i$ holds by definition: If $ue \in UC_i \subseteq UC_1 \cup UC_2 = UC$ then $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : ue$ (where ue restricts $\widehat{\alpha}^{\pm}$) holds since $\Xi \vdash \widehat{\sigma} : \text{dom}(UC)$.

Lemma 70 (Completeness of Unification Constraint Entry Merge). For a fixed context Θ , suppose that $\Theta \vdash ue_1$ and $\Theta \vdash ue_2$ are matching constraint entries.

+ for a type P such that $\Theta \vdash P : ue_1$ and $\Theta \vdash P : ue_2$, $\Theta \vdash ue_1 \& ue_2 = ue$ is defined and $\Theta \vdash P : ue$.

, Vol. 1, No. 1, Article . Publication date: July 2024.

- for a type N such that $\Theta \vdash N : ue_1$ and $\Theta \vdash N : ue_2$, $\Theta \vdash ue_1 \& ue_2 = ue$ is defined and $\Theta \vdash N : ue$.

Proof. Let us consider the shape of ue_1 and ue_2 .

Case 1. ue_1 is $\widehat{\alpha}^+ :\simeq Q_1$ and ue_2 is $\widehat{\alpha}^+ :\simeq Q_2$. Then $\Theta \vdash P : ue_1$ means $\Theta \vdash P \simeq^{\varsigma} Q_1$, and $\Theta \vdash P : ue_2$ means $\Theta \vdash P \simeq^{\varsigma} Q_2$. Then by transitivity of equivalence (Corollary 10), $\Theta \vdash Q_1 \simeq^{\varsigma} Q_2$, which means $\mathsf{nf}(Q_1) = \mathsf{nf}(Q_2)$ by Lemma 48. Hence, $(\simeq \&^+ \simeq)$ applies to infer $\Theta \vdash ue_1 \& ue_2 = ue_2$, and $\Theta \vdash P : ue_2$ holds by assumption.

Case 2. ue_1 is $\widehat{\alpha}^- :\simeq N_1$ and ue_2 is $\widehat{\alpha}^- :\simeq M_2$. The proof is symmetric.

Lemma 71 (Completeness of Unification Constraint Merge). Suppose that $\Xi \vdash UC_1$ and $\Xi \vdash UC_2$. Then for any $\widehat{\Theta} \supseteq \text{dom}(UC_1) \cup \text{dom}(UC_2)$ and substitution $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$ such that $\Xi \vdash \widehat{\sigma} : UC_1$ and $\Xi \vdash \widehat{\sigma} : UC_2$,

- (1) $\Xi \vdash UC_1 \& UC_2 = UC$ is defined and
- (2) $\Xi \vdash \widehat{\sigma} : UC$.

5291 5292 **Proof.** The proof repeats the proof of Lemma 91 for cases uses Lemma 70 instead of Lemma 90. □

3.3.6 Unification.

Observation 7 (Unification Determinism).

- + If Θ ; $\Xi \models P \stackrel{u}{\simeq} Q = UC$ and Θ ; $\Xi \models P \stackrel{u}{\simeq} Q = UC'$ then UC = UC'.
- If $\Theta: \Xi \models \mathbb{N} \stackrel{u}{\simeq} M = UC$ and $\Theta: \Xi \models \mathbb{N} \stackrel{u}{\simeq} M = UC'$ then UC = UC'.

Proof. We prove it by mutual structural induction on Θ ; $\Xi \models P \stackrel{u}{\simeq} Q = UC$ and Θ ; $\Xi \models N \stackrel{u}{\simeq} M = UC'$. Let us consider the positive case only since the negative case is symmetric.

First, notice that the rule applied the last is uniquely determined by the shape of P and Q. Second, the premises of each rule are deterministic on the input either by the induction hypothesis or by Observation 6.

Lemma 72 (Soundness of Unification).

- + For normalized \underline{P} and \underline{Q} such that Θ ; dom $(\Xi) \vdash \underline{P}$ and $\Theta \vdash \underline{Q}$, if Θ ; $\Xi \models \underline{P} \stackrel{u}{\simeq} \underline{Q} = UC$ then $\Xi \vdash UC$: fav (\underline{P}) and for any normalized $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : UC$, $[\widehat{\sigma}]\underline{P} = \underline{Q}$.
- For normalized N and M such that Θ ; dom (Ξ) \vdash N and Θ \vdash M, if Θ ; Ξ \vdash N $\stackrel{u}{\simeq}$ M \dashv UC then Ξ \vdash UC: fav(N) and for any normalized $\widehat{\sigma}$ such that Ξ \vdash $\widehat{\sigma}$: UC, $[\widehat{\sigma}]$ N = M.

Proof. We prove by induction on the derivation of Θ ; $\Xi \models \mathbb{N} \stackrel{u}{\simeq} M = UC$ and mutually Θ ; $\Xi \models \mathbb{P} \stackrel{u}{\simeq} Q = UC$. Let us consider the last rule forming this derivation.

- **Case 1.** (VAR $^{\frac{u}{2}}$), then $N = \alpha^{-} = M$. The resulting unification constraint is empty: $UC = \cdot$. It satisfies $\Xi \vdash UC : \cdot$ vacuously, and $[\widehat{\sigma}]\alpha^{-} = \alpha^{-}$, that is $[\widehat{\sigma}]N = M$.
- **Case 2.** $(\uparrow^{\stackrel{u}{\simeq}})$, then $N = \uparrow P$ and $M = \uparrow Q$. The algorithm makes a recursive call to $\Theta; \Xi \models P \stackrel{u}{\simeq} Q = UC$ returning UC. By induction hypothesis, $\Xi \vdash UC : \mathsf{fav}(P)$ and thus, $\Xi \vdash UC : \mathsf{fav}(\uparrow P)$, and for any $\Xi \vdash \widehat{\sigma} : UC$, $[\widehat{\sigma}]N = [\widehat{\sigma}]\uparrow P = \uparrow [\widehat{\sigma}]P = \uparrow Q = M$, as required.
- **Case 3.** $(\rightarrow^{\stackrel{u}{\simeq}})$, then $N = P \to N'$ and $M = Q \to M'$. The algorithm makes two recursive calls to $\Theta; \Xi \models P \stackrel{u}{\simeq} Q = UC_1$ and $\Theta; \Xi \models N' \stackrel{u}{\simeq} M' = UC_2$ returning $\Xi \vdash UC_1 \& UC_2 = UC$ as the result.

It is clear that P, N', Q, and M' are normalized, and that Θ ; dom $(\Xi) \vdash P$, Θ ; dom $(\Xi) \vdash N'$, $\Theta \vdash Q$, and $\Theta \vdash M'$. This way, the induction hypothesis is applicable to both recursive calls.

By applying the induction hypothesis to Θ ; $\Xi \models \mathbb{P} \stackrel{u}{\simeq} Q = UC_1$, we have:

• $\Xi \vdash UC_1 : \mathsf{fav}(\underline{P}),$

 • for any $\Xi \vdash \widehat{\sigma}' : UC_1$, $[\widehat{\sigma}']P = Q$.

By applying it to Θ ; $\Xi \models N' \stackrel{u}{\simeq} M' = UC_2$, we have:

- $\Xi \vdash UC_2 : fav(N')$,
- for any $\Xi \vdash \widehat{\sigma}' : UC_2$, $[\widehat{\sigma}'] N' = M'$.

Let us take an arbitrary $\Xi \vdash \widehat{\sigma} : UC$. By the soundness of the constraint merge (Lemma 89), $\Xi \vdash UC_1 \& UC_2 = UC$ implies $\Xi \vdash \widehat{\sigma} : UC_1$ and $\Xi \vdash \widehat{\sigma} : UC_2$.

Applying the induction hypothesis to $\Xi \vdash \widehat{\sigma} : UC_1$, we have $[\widehat{\sigma}] \stackrel{P}{=} Q$; applying it to $\Xi \vdash \widehat{\sigma} : UC_2$, we have $[\widehat{\sigma}] \stackrel{N'}{=} M'$. This way, $[\widehat{\sigma}] \stackrel{N}{=} [\widehat{\sigma}] \stackrel{P}{=} \to [\widehat{\sigma}] \stackrel{N'}{=} Q \to M' = M$.

Case 4. $(\bigvee_{=}^{u})$, then $N = \forall \overrightarrow{\alpha^{+}}$. N' and $M = \forall \overrightarrow{\alpha^{+}}$. M'. The algorithm makes a recursive call to $\Theta, \overrightarrow{\alpha^{+}}; \Xi \models N' \stackrel{u}{\simeq} M' \dashv UC$ returning UC as the result.

The induction hypothesis is applicable: $\Theta, \overrightarrow{\alpha^+}$; $\operatorname{dom}(\Xi) \vdash N'$ and $\Theta, \overrightarrow{\alpha^+} \vdash M'$ hold by inversion, and N' and M' are normalized, since N and M are. Let us take an arbitrary $\Xi \vdash \widehat{\sigma} : UC$. By the induction hypothesis, $[\widehat{\sigma}]N' = M'$. Then $[\widehat{\sigma}]N = [\widehat{\sigma}] \forall \overrightarrow{\alpha^+}. N' = \forall \overrightarrow{\alpha^+}. [\widehat{\sigma}]N' = \forall \overrightarrow{\alpha^+}. M' = M$.

Case 5. (UVAR $\stackrel{u}{=}$), then $N = \widehat{\alpha}^-$, $\widehat{\alpha}^-$ { Θ_0 } $\in \Xi$, and $\Theta_0 \vdash M$. As the result, the algorithm returns $UC = (\widehat{\alpha}^- : \cong M)$.

It is clear that $\widehat{\alpha}^-\{\Theta_0\} \vdash (\widehat{\alpha}^- :\simeq M)$, since $\Theta_0 \vdash M$, meaning that $\Xi \vdash UC$.

Let us take an arbitrary $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : UC$. Since $UC = (\widehat{\alpha}^- : \simeq M)$, $\Xi \vdash \widehat{\sigma} : UC$ implies $\Xi(\widehat{\alpha}^-) \vdash [\widehat{\sigma}]\widehat{\alpha}^- : (\widehat{\alpha}^- : \simeq M)$. By inversion of $(:\simeq_-^{\text{SAT}})$, it means $\Xi(\widehat{\alpha}^-) \vdash [\widehat{\sigma}]\widehat{\alpha}^- \simeq^{\leqslant} M$. This way, $\Xi(\widehat{\alpha}^-) \vdash [\widehat{\sigma}] N \simeq^{\leqslant} M$. Notice that $\widehat{\sigma}$ and N are normalized, and by Lemma 43, so is $[\widehat{\sigma}] N$. Since both sides of $\Xi(\widehat{\alpha}^-) \vdash [\widehat{\sigma}] N \simeq^{\leqslant} M$ are normalized, by Lemma 48, we have $[\widehat{\sigma}] N = M$.

Case 6. The positive cases are proved symmetrically.

Lemma 73 (Completeness of Unification).

+ For normalized \underline{P} and \underline{Q} such that Θ ; dom $(\Xi) \vdash \underline{P}$ and $\Theta \vdash \underline{Q}$, suppose that there exists $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{P})$ such that $[\widehat{\sigma}]\underline{P} = \underline{Q}$, then $\Theta : \Xi \vdash \underline{P} \stackrel{u}{\simeq} \underline{Q} = \underline{UC}$ for some \underline{UC} .

- For normalized N and M such that Θ ; dom $(\Xi) \vdash N$ and $\Theta \vdash M$, suppose that there exists $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(N)$ such that $[\widehat{\sigma}] N = M$, then $\Theta : \Xi \vdash N \stackrel{u}{\simeq} M \dashv UC$ for some UC.

Proof. We prove it by induction on the structure of \underline{P} and mutually, \underline{N} .

Case 1. $N = \widehat{\alpha}^-$

 Θ ; dom $(\Xi) \vdash \widehat{\alpha}^-$ means that $\widehat{\alpha}^- \{\Theta_0\} \in \Xi$ for some Θ_0 .

Let us take an arbitrary $\Xi \vdash \widehat{\sigma} : \widehat{\alpha}^-$ such that $[\widehat{\sigma}]\widehat{\alpha}^- = M$. $\Xi \vdash \widehat{\sigma} : \widehat{\alpha}^-$ means that $\Theta_0 \vdash M$. This way, $(UVAR^{\frac{u}{2}})$ is applicable to infer $\Theta : \Xi \vdash \widehat{\alpha}^{-\frac{u}{2}} M \dashv (\widehat{\alpha}^{-} : \cong M)$.

Case 2. $N = \alpha^-$

Let us take an arbitrary $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\alpha^-)$ such that $[\widehat{\sigma}]\alpha^- = M$. Since $\mathsf{fav}(\alpha^-) = \emptyset$, $[\widehat{\sigma}]\alpha^- = M$ means $M = \alpha^-$.

This way, $(VAR^{\frac{u}{2}})$ infers $\Theta; \Xi \models \alpha^{-\frac{u}{2}} \alpha^{-} \dashv \cdot$, which is rewritten as $\Theta; \Xi \models N \stackrel{u}{\simeq} M \dashv \cdot$.

Case 3. $N = \uparrow P$

Let us take an arbitrary $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{P})$ such that $[\widehat{\sigma}] \uparrow \underline{P} = M$. The latter means $\uparrow [\widehat{\sigma}] \underline{P} = M$, i.e. $M = \uparrow \underline{O}$ for some \underline{O} and $[\widehat{\sigma}] \underline{P} = \underline{O}$.

Let us show that the induction hypothesis is applicable to $[\widehat{\sigma}]P = Q$. Notice that P is normalized, since $N = \uparrow P$ is normalized, Θ ; dom $(\Xi) \vdash P$ holds by inversion of Θ ; dom $(\Xi) \vdash \uparrow P$, and $\Theta \vdash Q$ holds by inversion of $\Theta \vdash \uparrow Q$.

This way, by the induction hypothesis there exists UC such that Θ ; $\Xi \models \mathbb{P} \stackrel{u}{\simeq} Q = UC$.

Case 4. $N = P \rightarrow N'$

Let us take an arbitrary $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{P} \to \underline{N'})$ such that $[\widehat{\sigma}](\underline{P} \to \underline{N'}) = M$. The latter means $[\widehat{\sigma}]\underline{P} \to [\widehat{\sigma}]\underline{N'} = M$, i.e. $M = \underline{Q} \to M'$ for some \underline{Q} and M', such that $[\widehat{\sigma}]\underline{P} = \underline{Q}$ and $[\widehat{\sigma}]\underline{N'} = M'$.

Let us show that the induction hypothesis is applicable to $\Xi \vdash \widehat{\sigma}|_{\mathsf{fav}(\underline{P})}$: $\mathsf{fav}(\underline{P})$ and $[\widehat{\sigma}|_{\mathsf{fav}(\underline{P})}]\underline{P} = \underline{Q}$ (the latter holds since $[\widehat{\sigma}|_{\mathsf{fav}(\underline{P})}]\underline{P} = [\widehat{\sigma}]\underline{P}$ by Lemma 63),

• P is normalized, since $N = P \rightarrow N'$ is normalized

- Θ ; dom $(\Xi) \vdash P$ follows from the inversion of Θ ; dom $(\Xi) \vdash P \to N'$,
- $\Theta \vdash Q$.

 Then by the induction hypothesis, $\Theta; \Xi \models \mathbb{P} \stackrel{u}{\simeq} Q = UC_1$. Analogously, the induction hypothesis is applicable to $[\widehat{\sigma}|_{\mathsf{fav}(\mathbb{N}')}]\mathbb{N}' = M'$, and thus, $\Theta; \Xi \models \mathbb{N}' \stackrel{u}{\simeq} M' = UC_2$.

To apply $(\to^{\stackrel{u}{\simeq}})$ and infer the required $\Theta; \Xi \models \mathbb{N} \stackrel{u}{\simeq} M = UC$, it is left to show that $\Xi \vdash UC_1 \& UC_2 = UC$. It holds by completeness of the unification constraint merge (Lemma 71) for $\Xi \vdash UC_1 : \mathsf{fav}(\mathbb{P}), \Xi \vdash UC_2 : \mathsf{fav}(\mathbb{N}')$ (which hold by soundness), and $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\mathbb{P}) \cup \mathsf{fav}(\mathbb{N}')$, which holds since $\mathsf{fav}(\mathbb{P}) \cup \mathsf{fav}(\mathbb{N}') = \mathsf{fav}(\mathbb{P} \to \mathbb{N}')$. Notice that by soundness, $\Xi \vdash \widehat{\sigma}|_{\mathsf{fav}(\mathbb{P})} : UC_1$, which implies $\Xi \vdash \widehat{\sigma} : UC_1$. Analogously, $\Xi \vdash \widehat{\sigma} : UC_2$.

Case 5. $N = \forall \overrightarrow{\alpha^+}$. N'

Let us take an arbitrary $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(N')$ such that $[\widehat{\sigma}] \forall \widehat{\alpha^+} . N' = M$. The latter means $\forall \widehat{\alpha^+} . [\widehat{\sigma}] N' = M$, i.e. $M = \forall \widehat{\alpha^+} . M'$ for some M' such that $[\widehat{\sigma}] N' = M'$.

Let us show that the induction hypothesis is applicable to $[\widehat{\sigma}]N' = M'$. Notice that N' is normalized, since $N = \forall \overrightarrow{\alpha^+}$. N' is normalized, Θ , $\overrightarrow{\alpha^+}$; dom $(\Xi) \vdash N'$ follows from inversion of Θ ; dom $(\Xi) \vdash \forall \overrightarrow{\alpha^+}$. N', Θ , $\overrightarrow{\alpha^+} \vdash M'$ follows from inversion of $\Theta \vdash \forall \overrightarrow{\alpha^+}$. M', and $\Xi \vdash \widehat{\sigma}$: fav(N') by assumption.

This way, by the induction hypothesis, $\Theta, \overrightarrow{\alpha^+}; \Xi \models N' \stackrel{u}{\simeq} M' = UC$ exists and moreover, $\Xi \vdash \widehat{\sigma} : UC$. Hence, $(\forall^{\stackrel{u}{\simeq}})$ is applicable to infer $\Theta; \Xi \models \forall \overrightarrow{\alpha^+}, N' \stackrel{u}{\simeq} \forall \overrightarrow{\alpha^+}, M' = UC$, that is $\Theta; \Xi \models N \stackrel{u}{\simeq} M = UC$.

Case 6. The positive cases are proved symmetrically.

3.3.7 Anti-unification.

Observation 8 (Determinism of Anti-unification Algorithm).

- $+ \text{ If } \Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \underline{Q}, \widehat{\tau}_1, \widehat{\tau}_2) \text{ and } \Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}', \underline{Q}', \widehat{\tau}_1', \widehat{\tau}_2'), \text{ then } \widehat{\Theta} = \widehat{\Theta}', \underline{Q} = \underline{Q}', \widehat{\tau}_1 = \widehat{\tau}_1', \text{ and } \widehat{\tau}_2 = \widehat{\tau}_2'.$
- $-\text{ If }\Theta\models N_1\stackrel{a}{\simeq}N_2 \preccurlyeq (\widehat{\Theta},M,\widehat{\tau}_1,\widehat{\tau}_2) \text{ and }\Theta\models N_1\stackrel{a}{\simeq}N_2 \preccurlyeq (\widehat{\Theta}',M',\widehat{\tau}_1',\widehat{\tau}_2'), \text{ then }\widehat{\Theta}=\widehat{\Theta}',M=M',\\ \widehat{\tau}_1=\widehat{\tau}_1',\text{ and }\widehat{\tau}_2=\widehat{\tau}_2'.$

Proof. By trivial induction on $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \mathbb{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ and mutually on $\Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}, \mathbb{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$.

, Vol. 1, No. 1, Article . Publication date: July 2024.

Observation 9 (*Uniqueness of Anti-unification Variable Names*). Names of the anti-unification variables are uniquely defined by the types they are mapped to by the resulting substitutions.

- + Assuming P_1 and P_2 are normalized, if $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \mathbb{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ then for any $\widehat{\beta}^- \in \widehat{\Theta}$, $\widehat{\beta}^- = \widehat{\alpha}^-_{\{[\widehat{\tau}_1|\widehat{\beta}^-, [\widehat{\tau}_2|\widehat{\beta}^-]\}}$
- Assuming N_1 and N_2 are normalized, if $\Theta \models N_1 \stackrel{a}{\simeq} N_2 \ni (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ then for any $\widehat{\beta}^- \in \widehat{\Theta}$, $\widehat{\beta}^- = \widehat{\alpha}^-_{\{[\widehat{\tau}_1]\widehat{\beta}^-, [\widehat{\tau}_2]\widehat{\beta}^-\}}$

Proof. By simple induction on $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \mathbb{Q}, \widehat{\tau_1}, \widehat{\tau_2})$ and mutually on $\Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}, \mathbb{M}, \widehat{\tau_1}, \widehat{\tau_2})$. Let us consider the last rule applied to infer this judgment.

- **Case 1**. $(VAR^{\frac{\alpha}{2}}_{+})$ or $(VAR^{\frac{\alpha}{2}}_{-})$, then $\widehat{\Theta} = \cdot$, and the property holds vacuously.
- Case 2. (AU) Then $\widehat{\Theta} = \widehat{\alpha}_{\{N_1,N_2\}}^-$, $\widehat{\tau}_1 = \widehat{\alpha}_{\{N_1,N_2\}}^- \mapsto N_1$, and $\widehat{\tau}_2 = \widehat{\alpha}_{\{N_1,N_2\}}^- \mapsto N_2$. So the property holds trivially.
- Case 3. $(\rightarrow^{\stackrel{\alpha}{=}})$ In this case, $\widehat{\Theta} = \widehat{\Theta}' \cup \widehat{\Theta}''$, $\widehat{\tau}_1 = \widehat{\tau}_1' \cup \widehat{\tau}_1''$, and $\widehat{\tau}_2 = \widehat{\tau}_2' \cup \widehat{\tau}_2''$, where the property holds for $(\widehat{\Theta}', \widehat{\tau}_1', \widehat{\tau}_2')$ and $(\widehat{\Theta}'', \widehat{\tau}_1'', \widehat{\tau}_2'')$ by the induction hypothesis. Then since the union of solutions does not change the types the variables are mapped to, the required property holds for $\widehat{\Theta}$, $\widehat{\tau}_1$, and $\widehat{\tau}_2$.
- **Case 4**. For the other rules, the resulting $\widehat{\Theta}$ is taken from the recursive call and the required property holds immediately by the induction hypothesis.

Lemma 74 (Soundness of Anti-Unification).

- + Assuming P_1 and P_2 are normalized, if $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \widehat{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ then
 - (1) Θ ; $\widehat{\Theta} \vdash \overline{Q}$,

- (2) Θ ; $\cdot \vdash \widehat{\tau}_i : \widehat{\Theta}$ for $i \in \{1, 2\}$ are anti-unification substitutions, and
- (3) $[\widehat{\tau}_i] Q = P_i \text{ for } i \in \{1, 2\}.$
- Assuming N_1 and N_2 are normalized, if $\Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ then
 - (1) Θ ; $\widehat{\Theta} \vdash M$,
 - (2) Θ ; $\cdot \vdash \widehat{\tau}_i : \widehat{\Theta}$ for $i \in \{1, 2\}$ are anti-unification substitutions, and
 - (3) $[\hat{\tau}_i] M = N_i \text{ for } i \in \{1, 2\}.$

Proof. We prove it by induction on $\Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ and mutually, $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$. Let us consider the last rule applied to infer this judgement.

Case 1. (VAR_{-}^{α}) , then $N_1 = \alpha^- = N_2$, $\widehat{\Theta} = \cdot$, $M = \alpha^-$, and $\widehat{\tau}_1 = \widehat{\tau}_2 = \cdot$.

- (1) Θ ; $\cdot \vdash \alpha^-$ follows from the assumption $\Theta \vdash \alpha^-$,
- (2) Θ ; $\cdot \vdash \cdot : \cdot$ holds trivially, and
- (3) $[\cdot]\alpha^- = \alpha^-$ holds trivially.

5489 5490

5498

5500

5504

5524

5526

5528

5529

5530

5532

5533 5534

5535

5536 5537 **Case 2.** $(\uparrow^{\stackrel{a}{\simeq}})$, then $N_1 = \uparrow P_1$, $N_2 = \uparrow P_2$, and the algorithm makes the recursive call: $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$, returning $(\widehat{\Theta}, \uparrow Q, \widehat{\tau}_1, \widehat{\tau}_2)$ as the result.

Since $N_1 = \uparrow P_1$ and $N_2 = \uparrow P_2$ are normalized, so are P_1 and P_2 , and thus, the induction hypothesis is applicable to $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$:

- (1) Θ ; $\widehat{\Theta} \vdash Q$, and hence, Θ ; $\widehat{\Theta} \vdash \uparrow Q$,
- (2) Θ ; $\vdash \widehat{\tau}_i : \widehat{\Theta}$ for $i \in \{1, 2\}$, and
- (3) $[\widehat{\tau}_i]Q = P_i$ for $i \in \{1, 2\}$, and then by the definition of the substitution, $[\widehat{\tau}_i] \uparrow Q = \uparrow P_i$ for $i \in \{1, 2\}$.

Case 3. $(\rightarrow^{\stackrel{a}{\hookrightarrow}})$, then $N_1 = P_1 \rightarrow N_1'$, $N_2 = P_2 \rightarrow N_2'$, and the algorithm makes two recursive calls: $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \overline{Q}, \widehat{\tau_1}, \widehat{\tau_2})$ and $\Theta \models N_1' \stackrel{a}{\simeq} N_2' = (\widehat{\Theta}', \overline{M}, \widehat{\tau_1}', \widehat{\tau_2}')$ and and returns $(\widehat{\Theta} \cup \widehat{\Theta}', \overline{Q} \rightarrow \overline{M}, \widehat{\tau_1} \cup \widehat{\tau_1}', \widehat{\tau_2} \cup \widehat{\tau_2}')$ as the result.

Notice that the induction hypothesis is applicable to $\Theta \models P_1 \stackrel{a}{\simeq} P_2 \neq (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$: P_1 and P_2 are normalized, since $N_1 = P_1 \rightarrow N_1'$ and $N_2 = P_2 \rightarrow N_2'$ are normalized. Similarly, the induction hypothesis is applicable to $\Theta \models N_1' \stackrel{a}{\simeq} N_2' \neq (\widehat{\Theta}', M, \widehat{\tau}_1', \widehat{\tau}_2')$.

This way, by the induction hypothesis:

- (1) Θ ; $\widehat{\Theta} \vdash Q$ and Θ ; $\widehat{\Theta}' \vdash M$. Then by weakening (Corollary 22), Θ ; $\widehat{\Theta} \cup \widehat{\Theta}' \vdash Q$ and Θ ; $\widehat{\Theta} \cup \widehat{\Theta}' \vdash M$, which implies Θ ; $\widehat{\Theta} \cup \widehat{\Theta}' \vdash Q \rightarrow M$;
- (2) $\Theta; \vdash \widehat{\tau_i} : \widehat{\Theta}$ and $\Theta; \vdash \widehat{\tau_i'} : \widehat{\Theta}'$ Then $\Theta; \vdash \widehat{\tau_i} \cup \widehat{\tau_i'} : \widehat{\Theta} \cup \widehat{\Theta}'$ are well-defined anti-unification substitutions. Let us take an arbitrary $\widehat{\beta}^- \in \widehat{\Theta} \cup \widehat{\Theta}'$. If $\widehat{\beta}^- \in \widehat{\Theta}$. then $\Theta; \vdash \widehat{\tau_i} : \widehat{\Theta}$ implies that $\widehat{\tau_i}$, and hence, $\widehat{\tau_i} \cup \widehat{\tau_i'}$ contains an entry well-formed in Θ . If $\widehat{\beta}^- \in \widehat{\Theta}'$, the reasoning is symmetric.
 - $\widehat{ au}_i \cup \widehat{ au}_i'$ is a well-defined anti-unification substitution: any anti-unification variable occurs uniquely $\widehat{ au}_i \cup \widehat{ au}_i'$, since by Observation 9, the name of the variable is in one-to-one correspondence with the pair of types it is mapped to by $\widehat{ au}_1$ and $\widehat{ au}_2$, an is in one-to-one correspondence with the pair of types it is mapped to by $\widehat{ au}_1'$ and $\widehat{ au}_2'$ i.e. if $\widehat{eta}^- \in \widehat{\Theta} \cap \widehat{\Theta}'$ then $[\widehat{ au}_1]\widehat{eta}^- = [\widehat{ au}_1']\widehat{eta}^-$, and $[\widehat{ au}_2]\widehat{eta}^- = [\widehat{ au}_2']\widehat{eta}^-$.
- (3) $[\widehat{\tau}_i] Q = P_i$ and $[\widehat{\tau}_i'] M = N_i'$. Since $\widehat{\tau}_i \cup \widehat{\tau}_i'$ restricted to $\widehat{\Theta}$ is $\widehat{\tau}_i$, and $\widehat{\tau}_i \cup \widehat{\tau}_i'$ restricted to $\widehat{\Theta}'$ is $\widehat{\tau}_i'$, we have $[\widehat{\tau}_i \cup \widehat{\tau}_i'] Q = P_i$ and $[\widehat{\tau}_i \cup \widehat{\tau}_i'] M = N_i'$, and thus, $[\widehat{\tau}_i \cup \widehat{\tau}_i'] Q \to M = P_1 \to N_1'$

Case 4. (\forall^{α}) , then $N_1 = \forall \overrightarrow{\alpha^+}$. N'_1 , $N_2 = \forall \overrightarrow{\alpha^+}$. N'_2 , and the algorithm makes a recursive call: $\Theta \models N'_1 \stackrel{\alpha}{=} N'_2 = (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ and returns $(\widehat{\Theta}, \forall \overrightarrow{\alpha^+}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ as the result.

Similarly to case 2, we apply the induction hypothesis to $\Theta \models N_1' \stackrel{a}{\simeq} N_2' \dashv (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ to obtain:

- (1) $\Theta : \widehat{\Theta} \vdash M$, and hence, $\Theta : \widehat{\Theta} \vdash \forall \overrightarrow{\alpha^+}$. M:
- (2) Θ ; $\vdash \widehat{\tau}_i : \widehat{\Theta}$ for $i \in \{1, 2\}$, and

5585 5586 (3) $[\widehat{\tau_i}]M = N'_i$ for $i \in \{1, 2\}$, and then by the definition of the substitution, $[\widehat{\tau_i}] \forall \overrightarrow{\alpha^+}. M = \forall \overrightarrow{\alpha^+}. N'_i$ for $i \in \{1, 2\}.$

Case 5. (AU), which applies when other rules do not, and $\Theta \vdash N_i$, returning as the result $(\widehat{\Theta}, \underline{M}, \widehat{\tau}_1, \widehat{\tau}_2) = (\widehat{\alpha}_{\{N_1, N_2\}}^-, \widehat{\alpha}_{\{N_1, N_2\}}^-, (\widehat{\alpha}_{\{N_1, N_2\}}^- \mapsto N_1), (\widehat{\alpha}_{\{N_1, N_2\}}^- \mapsto N_2)).$

- (1) Θ ; $\widehat{\Theta} \vdash M$ is rewritten as Θ ; $\widehat{\alpha}_{\{N_1,N_2\}}^- \vdash \widehat{\alpha}_{\{N_1,N_2\}}^-$, which holds trivially;
- (2) Θ ; $\cdot \vdash \widehat{\tau_i} : \widehat{\Theta}$ is rewritten as Θ ; $\cdot \vdash (\widehat{\alpha}_{\{N_1,N_2\}}^- \mapsto N_i) : \widehat{\alpha}_{\{N_1,N_2\}}^-$, which holds since $\Theta \vdash N_i$ by the premise of the rule;
- (3) $[\widehat{\tau_i}]M = N_i$ is rewritten as $[\widehat{\alpha}_{\{N_1,N_2\}}] \mapsto N_i [\widehat{\alpha}_{\{N_1,N_2\}}] = N_i$, which holds trivially by the definition of substitution.

Case 6. Positive cases are proved symmetrically.

Lemma 75 (Completeness of Anti-Unification).

- + Assume that P_1 and P_2 are normalized, and there exists $(\widehat{\Theta}', \underline{Q}', \widehat{\tau}'_1, \widehat{\tau}'_2)$ such that
 - (1) Θ ; $\widehat{\Theta}' \vdash \underline{Q}'$,
 - (2) Θ ; $\cdot \vdash \widehat{\tau}'_i : \widehat{\Theta}'$ for $i \in \{1, 2\}$ are anti-unification substitutions, and
 - (3) $[\hat{\tau}'_i] Q' = P_i \text{ for } i \in \{1, 2\}.$

Then the anti-unification algorithm terminates, that is there exists $(\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ such that $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$

- Assume that N_1 and N_2 are normalized, and there exists $(\widehat{\Theta}', \underline{M}', \widehat{\tau}'_1, \widehat{\tau}'_2)$ such that
 - (1) Θ ; $\widehat{\Theta}' \vdash \underline{M}'$,
 - (2) Θ ; $\cdot \vdash \widehat{\tau}'_i : \widehat{\Theta}'$ for $i \in \{1, 2\}$, are anti-unification substitutions, and
 - (3) $[\widehat{\tau}'_i]M' = N_i \text{ for } i \in \{1, 2\}.$

, Vol. 1, No. 1, Article . Publication date: July 2024.

Then the anti-unification algorithm succeeds, that is there exists $(\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ such that $\Theta \models N_1 \stackrel{a}{\simeq} N_2 \ni (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$.

Proof. We prove it by the induction on M' and mutually on Q'.

- **Case 1.** $\underline{M}' = \widehat{\alpha}^-$ Then since $\Theta : \cdot \vdash \widehat{\tau}'_i : \widehat{\Theta}', \Theta \vdash [\widehat{\tau}'_i]\underline{M}' = N_i$. This way, (AU) is always applicable if other rules are not.
- Case 2. $M' = \alpha^-$ Then $\alpha^- = [\widehat{\tau}'_i]\alpha^- = N_i$, which means that $(VAR^{\stackrel{a}{\sim}})$ is applicable.
- **Case 3.** $M' = \uparrow Q'$ Then $\uparrow [\widehat{\tau}'_i] Q' = [\widehat{\tau}'_i] \uparrow Q' = N_i$, that is N_1 and N_2 have form $\uparrow P_1$ and $\uparrow P_2$ respectively.

Moreover, $[\widehat{\tau}'_i] Q' = P_i$, which means that $(\widehat{\Theta}', Q', \widehat{\tau}'_1, \widehat{\tau}'_2)$ is an anti-unifier of P_1 and P_2 . Then by the induction hypothesis, there exists $(\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ such that $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$, and hence, $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, Q, \widehat{\tau}_1, \widehat{\tau}_2)$, $\widehat{\tau}_1, \widehat{\tau}_2 = \widehat{\tau}_2$.

Case 4. $M' = \forall \overrightarrow{\alpha^+}$. M'' This case is similar to the previous one: we consider $\forall \overrightarrow{\alpha^+}$ as a constructor. Notice that $\forall \overrightarrow{\alpha^+}$. $[\widehat{\tau}'_i]M'' = [\widehat{\tau}'_i]\forall \overrightarrow{\alpha^+}$. $M'' = N_i$, that is N_1 and N_2 have form $\forall \overrightarrow{\alpha^+}$. N''_1 and $\forall \overrightarrow{\alpha^+}$. N''_2 respectively.

Moreover, $[\widehat{\tau}'_i]M'' = N''_i$, which means that $(\widehat{\Theta}', M'', \widehat{\tau}'_1, \widehat{\tau}'_2)$ is an anti-unifier of N''_1 and N''_2 . Then by the induction hypothesis, there exists $(\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ such that $\Theta \models N''_1 \stackrel{a}{\simeq} N''_2 = (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$, and hence, $\Theta \models \forall \overrightarrow{\alpha^+}$. $N''_1 \stackrel{a}{\simeq} \forall \overrightarrow{\alpha^+}$. $N''_2 = (\widehat{\Theta}, \forall \overrightarrow{\alpha^+}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ by $(\forall \overrightarrow{\alpha})$.

Case 5. $M' = Q' \to M''$ Then $[\widehat{\tau}'_i]Q' \to [\widehat{\tau}'_i]M'' = [\widehat{\tau}'_i](Q' \to M'') = N_i$, that is N_1 and N_2 have form $P_1 \to N'_1$ and $P_2 \to N'_2$ respectively.

Moreover, $[\widehat{\tau}_i'] Q' = P_i$ and $[\widehat{\tau}_i'] M'' = N_i''$, which means that $(\widehat{\Theta}', Q', \widehat{\tau}_1', \widehat{\tau}_2')$ is an anti-unifier of P_1 and P_2 , and $(\widehat{\Theta}', M'', \widehat{\tau}_1', \widehat{\tau}_2')$ is an anti-unifier of N_1'' and N_2'' . Then by the induction hypothesis, $\Theta \models P_1 \stackrel{a}{\cong} P_2 \ni (\widehat{\Theta}_1, Q, \widehat{\tau}_1, \widehat{\tau}_2)$ and $\Theta \models N_1'' \stackrel{a}{\cong} N_2'' \ni (\widehat{\Theta}_2, M, \widehat{\tau}_3, \widehat{\tau}_4)$ succeed. The result of the algorithm is $(\widehat{\Theta}_1 \cup \widehat{\Theta}_2, Q \to M, \widehat{\tau}_1 \cup \widehat{\tau}_3, \widehat{\tau}_2 \cup \widehat{\tau}_4)$.

- Case 6. $Q' = \widehat{\alpha}^+$ This case if not possible, since $\Theta : \widehat{\Theta}' \vdash Q'$ means $\widehat{\alpha}^+ \in \widehat{\Theta}'$, but $\widehat{\Theta}'$ can only contain negative variables.
- Case 7. Other positive cases are proved symmetrically to the corresponding negative ones.

Lemma 76 (Initiality of Anti-Unification).

- + Assume that P_1 and P_2 are normalized, and $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \overline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$, then $(\widehat{\Theta}, \overline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ is more specific than any other sound anti-unifier $(\widehat{\Theta}', \overline{Q}', \widehat{\tau}'_1, \widehat{\tau}'_2)$, i.e. if
 - (1) Θ ; $\widehat{\Theta}' \vdash \underline{Q}'$,

- (2) Θ ; $\cdot \vdash \widehat{\tau}'_i : \widehat{\Theta}'$ for $i \in \{1, 2\}$, and
- (3) $\left[\widehat{\tau}_{i}'\right]Q' = P_{i} \text{ for } i \in \{1, 2\}$

then there exists $\widehat{\rho}$ such that Θ ; $\widehat{\Theta} \vdash \widehat{\rho} : (\widehat{\Theta}'|_{\mathsf{fav}(\underline{Q}')})$ and $[\widehat{\rho}]\underline{Q}' = \underline{Q}$. Moreover, $[\widehat{\rho}]\widehat{\beta}^-$ can be uniquely determined by $[\widehat{\tau}'_1]\widehat{\beta}^-$, $[\widehat{\tau}'_2]\widehat{\beta}^-$, and Θ .

- Assume that N_1 and N_2 are normalized, and $\Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$, then $(\widehat{\Theta}, M, \widehat{\tau}_1, \widehat{\tau}_2)$ is more specific than any other sound anti-unifier $(\widehat{\Theta}', M', \widehat{\tau}'_1, \widehat{\tau}'_2)$, i.e. if
 - (1) Θ ; $\widehat{\Theta}' \vdash M'$,

- (2) Θ ; $\cdot \vdash \widehat{\tau}'_i : \widehat{\Theta}'$ for $i \in \{1, 2\}$, and
- (3) $[\hat{\tau}'_i]M' = N_i \text{ for } i \in \{1, 2\}$

then there exists $\widehat{\rho}$ such that Θ ; $\widehat{\Theta} \vdash \widehat{\rho} : (\widehat{\Theta}'|_{\mathsf{fav}(\underline{M}')})$ and $[\widehat{\rho}]\underline{M}' = \underline{M}$. Moreover, $[\widehat{\rho}]\widehat{\widehat{\beta}}^-$ can be uniquely determined by $[\widehat{\tau}'_1]\widehat{\beta}^-$, $[\widehat{\tau}'_2]\widehat{\beta}^-$, and Θ .

Proof. First, let us assume that M' is a algorithmic variable $\widehat{\alpha}^-$. Then we can take $\widehat{\rho} = \widehat{\alpha}^- \mapsto M$, which satisfies the required properties:

- Θ ; $\widehat{\Theta} \vdash \widehat{\rho} : (\widehat{\Theta}'|_{\mathsf{fav}(\underline{M}')})$ holds since $\widehat{\Theta}'|_{\mathsf{fav}(\underline{M}')} = \widehat{\alpha}^-$ and Θ ; $\widehat{\Theta} \vdash \underline{M}$ by the soundness of anti-unification (Lemma 74);
- $[\widehat{\rho}]M' = M$ holds by construction
- $[\widehat{\rho}]\widehat{\alpha}^- = M$ is the anti-unifier of $N_1 = [\widehat{\tau}_1']\widehat{\alpha}^-$ and $N_2 = [\widehat{\tau}_2']\widehat{\alpha}^-$ in context Θ , and hence, it is uniquely determined by them (Observation 8).

Now, we can assume that M' is not an algorithmic variable. We prove by induction on the derivation of $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \underline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ and mutually on the derivation of $\Theta \models N_1 \stackrel{a}{\simeq} N_2 = (\widehat{\Theta}, \underline{M}, \widehat{\tau}_1, \widehat{\tau}_2)$.

Since M' is not a algorithmic variable, the substitution acting on M' preserves its outer constructor. In other words, $[\hat{\tau}'_i]M' = N_i$ means that M', N_1 and N_2 have the same outer constructor. Let us consider the algorithmic anti-unification rule corresponding to this constructor, and show that it was successfully applied to anti-unify N_1 and N_2 (or P_1 and P_2).

Case 1. $(VAR_{-}^{\frac{\alpha}{2}})$, i.e. $N_1 = \alpha^- = N_2$. This rule is applicable since it has no premises.

Then $\widehat{\Theta} = \cdot$, $M = \alpha^-$, and $\widehat{\tau}_1 = \widehat{\tau}_2 = \cdot$. Since $[\widehat{\tau}_i']M' = N_i = \alpha^-$ and M' is not a algorithmic variable, $M' = \alpha^-$. Then we can take $\widehat{\rho} = \cdot$, which satisfies the required properties:

- Θ ; $\widehat{\Theta} \vdash \widehat{\rho} : (\widehat{\Theta}'|_{\mathsf{fav}(M')})$ holds vacuously since $\widehat{\Theta}'|_{\mathsf{fav}(M')} = \cdot$;
- $[\widehat{\rho}]M' = M$, that is $[\cdot]\alpha^- = \alpha^-$ holds by substitution properties;

• the unique determination of $[\widehat{\rho}]\widehat{\alpha}^-$ for $\widehat{\alpha}^- \in \widehat{\Theta}'|_{fav(M')} = \cdot$ holds vacuously.

Case 2. $(\uparrow^{\stackrel{a}{\simeq}})$, i.e. $N_1 = \uparrow P_1$ and $N_2 = \uparrow P_2$.

Then since $[\widehat{\tau}'_i]M' = N_i = \uparrow P_i$ and M' is not a algorithmic variable, $M' = \uparrow Q'$, where $[\widehat{\tau}'_i]Q' = P_i$. Let us show that $(\widehat{\Theta}', Q', \widehat{\tau}'_1, \widehat{\tau}'_2)$ is an anti-unifier of P_1 and P_2 .

- (1) Θ ; $\widehat{\Theta}' \vdash Q'$ holds by inversion of Θ ; $\widehat{\Theta}' \vdash \uparrow Q'$;
- (2) Θ ; $\cdot \vdash \widehat{\tau}'_i : \widehat{\Theta}'$ holds by assumption;
- (3) $[\widehat{\tau}'_i]Q' = P_i$ holds by assumption.

This way, by the completeness of anti-unification (Lemma 75), the anti-unification algorithm succeeds on P_1 and P_2 : $\Theta \models P_1 \stackrel{a}{\simeq} P_2 = (\widehat{\Theta}, \mathcal{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$, which means that $(\uparrow^{\stackrel{a}{\simeq}})$ is applicable to infer $\Theta \models \uparrow P_1 \stackrel{a}{\simeq} \uparrow P_2 = (\widehat{\Theta}, \uparrow \mathcal{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$.

Moreover, by the induction hypothesis, $(\widehat{\Theta}, \underline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ is more specific than $(\widehat{\Theta}', \underline{Q}', \widehat{\tau}_1', \widehat{\tau}_2')$, which immediately implies that $(\widehat{\Theta}, \uparrow \underline{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$ is more specific than $(\widehat{\Theta}', \uparrow \underline{Q}', \widehat{\tau}_1', \widehat{\tau}_2')$ (we keep the same $\widehat{\rho}$).

Case 3. $(\forall^{\stackrel{a}{\simeq}})$, i.e. $N_1 = \forall \overrightarrow{\alpha^+}$. N_1' and $N_2 = \forall \overrightarrow{\alpha^+}$. N_2' . The proof is symmetric to the previous case. Notice that the context Θ is not changed in $(\forall^{\stackrel{a}{\simeq}})$, as it represents the context in which the anti-unification variables must be instantiated, rather than the context forming the types that are being anti-unified.

Case 4.
$$(\rightarrow^{\stackrel{a}{\simeq}})$$
, i.e. $N_1 = P_1 \rightarrow N_1'$ and $N_2 = P_2 \rightarrow N_2'$.

Then since $[\widehat{\tau}'_i]M' = N_i = P_i \to N'_i$ and M' is not a algorithmic variable, $M' = Q' \to M''$, where $[\widehat{\tau}'_i]Q' = P_i$ and $[\widehat{\tau}'_i]M'' = N''_i$.

Let us show that $(\widehat{\Theta}', \underline{Q}', \widehat{\tau}'_1, \widehat{\tau}'_2)$ is an anti-unifier of \underline{P}_1 and \underline{P}_2 .

- (1) Θ ; $\widehat{\Theta}' \vdash Q'$ holds by inversion of Θ ; $\widehat{\Theta}' \vdash Q' \rightarrow M''$;
- (2) Θ ; $\cdot \vdash \widehat{\tau}'_i : \widehat{\Theta}'$ holds by assumption;
- (3) $[\widehat{\tau}'_i]Q' = P_i$ holds by assumption.

Similarly, $(\widehat{\Theta}', \underline{M}'', \widehat{\tau}'_1, \widehat{\tau}'_2)$ is an anti-unifier of N''_1 and N''_2 .

Then by the completeness of anti-unification (Lemma 75), the anti-unification algorithm succeeds on P_1 and P_2 : $\Theta \models P_1 \stackrel{a}{\cong} P_2 = (\widehat{\Theta}_1, \cite{Q}, \widehat{\tau}_1, \widehat{\tau}_2)$; and on N_1' and N_2' : $\Theta \models N_1'' \stackrel{a}{\cong} N_2'' = (\widehat{\Theta}_2, \clim{M'''}, \widehat{\tau}_3, \widehat{\tau}_4)$. Notice that $\widehat{\tau}_1 \& \widehat{\tau}_3$ and $\widehat{\tau}_2 \& \widehat{\tau}_4$ are defined, in other words, for any $\widehat{\beta} \in \widehat{\Theta}_1 \cap \widehat{\Theta}_2$, $[\widehat{\tau}_1]\widehat{\beta} = [\widehat{\tau}_2]\widehat{\beta}$ and $[\widehat{\tau}_3]\widehat{\beta} = [\widehat{\tau}_4]\widehat{\beta}$, which follows immediately

from Observation 9. This way, the algorithm proceeds by applying $(\stackrel{a}{\rightarrow^{\simeq}})$ and returns $(\widehat{\Theta}_1 \cup \widehat{\Theta}_2, \slashed{Q} \to M''', \widehat{\tau}_1 \cup \widehat{\tau}_3, \widehat{\tau}_2 \cup \widehat{\tau}_4)$.

It is left to construct $\widehat{\rho}$ such that Θ ; $\widehat{\Theta} \vdash \widehat{\rho} : (\widehat{\Theta}'|_{\mathsf{fav}(\underline{M}')})$ and $[\widehat{\rho}]\underline{M}' = \underline{M}$. By the induction hypothesis, there exist $\widehat{\rho}_1$ and $\widehat{\rho}_2$ such that Θ ; $\widehat{\Theta}_1 \vdash \widehat{\rho}_1 : (\widehat{\Theta}'|_{\mathsf{fav}(\underline{\mathbb{Q}'})})$, Θ ; $\widehat{\Theta}_2 \vdash \widehat{\rho}_2 : (\widehat{\Theta}'|_{\mathsf{fav}(\underline{M}'')})$, $[\widehat{\rho}_1]\underline{\mathbb{Q}}' = \underline{\mathbb{Q}}$, and $[\widehat{\rho}_2]\underline{M}'' = \underline{M}'''$.

Let us show that $\widehat{\rho} = \widehat{\rho}_1 \cup \widehat{\rho}_2$ satisfies the required properties:

- Θ ; $\widehat{\Theta}_1 \cup \widehat{\Theta}_2 \vdash \widehat{\rho}_1 \cup \widehat{\rho}_2 : (\widehat{\Theta}'|_{\mathsf{fav}(M')})$ holds since $\widehat{\Theta}'|_{\mathsf{fav}(M')} = \widehat{\Theta}'|_{\mathsf{fav}(\underline{Q}' \to M'')} = (\widehat{\Theta}'|_{\mathsf{fav}(\underline{Q}')}) \cup (\widehat{\Theta}'|_{\mathsf{fav}(M'')})$, Θ ; $\widehat{\Theta}_1 \vdash \widehat{\rho}_1 : (\widehat{\Theta}'|_{\mathsf{fav}(\underline{Q}')})$ and Θ ; $\widehat{\Theta}_2 \vdash \widehat{\rho}_2 : (\widehat{\Theta}'|_{\mathsf{fav}(M'')})$;
- $[\widehat{\rho}]M' = [\widehat{\rho}](Q' \to M'') = [\widehat{\rho}|_{\mathsf{fav}(Q')}]Q' \to [\widehat{\rho}|_{\mathsf{fav}(M'')}]M'' = [\widehat{\rho}_1]Q' \to [\widehat{\rho}_2]M'' = Q \to M''' = M;$
- Since $[\widehat{\rho}]\widehat{\beta}^-$ is either equal to $[\widehat{\rho}_1]\widehat{\beta}^-$ or $[\widehat{\rho}_2]\widehat{\beta}^-$, it inherits their property that it is uniquely determined by $[\widehat{\tau}_1']\widehat{\beta}^-$, $[\widehat{\tau}_2']\widehat{\beta}^-$, and Θ .

Case 5. $P_1 = P_2 = \alpha^+$. This case is symmetric to case 1.

Case 6. $P_1 = \bigcup N_1$ and $P_2 = \bigcup N_2$. This case is symmetric to case 2

Case 7. $P_1 = \exists \overrightarrow{\alpha}^2$. P_1' and $P_2 = \exists \overrightarrow{\alpha}^2$. P_2' . This case is symmetric to case 3

5780 5781 5782 **Observation 10** (*Determinism of Least Upper Bound algorithm*). For types $\Theta \vdash P_1$, and $\Theta \vdash P_2$, if $\Theta \models P_1 \lor P_2 = Q$ and $\Theta \models P_1 \lor P_2 = Q'$ then Q = Q'.

Proof. The shape of P_1 and P_2 uniquely determines the rule applied to infer the upper bound. By looking at the inference rules, it is easy to see that the result of the least upper bound algorithm depends on

- the inputs of the algorithm (that is P_1 , P_2 , and Θ), which are fixed;
- the result of the anti-unification algorithm applied to normalized input, which is deterministic by Observation 8;
- the result of the recursive call, which is deterministic by the induction hypothesis.

Lemma 77 (*Characterization of the Supertypes*). Let us define the set of upper bounds of a positive type UB(P) in the following way:

5783 $\Theta \vdash P$ $\mathsf{UB}(\Theta \vdash P)$ 5784 $\{\exists \overrightarrow{\alpha}^{\perp}, \beta^{+} \mid \text{ for } \overrightarrow{\alpha}^{\perp}\}\$ $\Theta \vdash \beta^+$ 5785 5786 $\Theta \vdash \exists \overrightarrow{\beta}^{-}. Q$ $UB(\Theta, \overrightarrow{\beta}^{-} + O)$ not using $\overrightarrow{\beta}^{-}$ 5787 $\left\{ \exists \overrightarrow{\alpha^{-}}. \downarrow M' \mid \text{ for } \overrightarrow{\alpha^{-}}, M', \text{ and } \overrightarrow{N} \text{ s.t.} \right. \\ \Theta \vdash N_{i}, \Theta, \overrightarrow{\alpha^{-}} \vdash M', \text{ and } \lceil \overrightarrow{N}/\overrightarrow{\alpha^{-}} \rceil \downarrow M' \simeq^{D} \downarrow M \right\}$ 5788 5789

Proof. By induction on $\Theta \vdash P : Q \ge P$.

5791

5792

5802

5810

5814

5816

5818

5819

5825

5826

5827

5828 5829

5830 5831

Case 1. $P = \beta^+$ Immediately from Lemma 19

Case 2. $P = \exists \overrightarrow{\beta}^{-}.P'$ Then if $\Theta \vdash Q \geqslant \exists \overrightarrow{\beta}^-$. P', then by Lemma 18, Θ , $\overrightarrow{\beta}^- \vdash Q \geqslant P'$, and fy $Q \cap \overrightarrow{\beta}^- = \emptyset$ by the convention. The other direction holds by (\exists^{\geq}) . This way, $\{Q \mid \Theta \vdash Q \geqslant \exists \overrightarrow{\beta}^{-}.P'\} = \{Q \mid Q \mid \Theta \vdash Q \geqslant \exists \overrightarrow{\beta}^{-}.P'\}$ $\Theta, \overrightarrow{\beta^-} \vdash Q \geqslant P'$ s.t. $\text{fv}(Q) \cap \overrightarrow{\beta^-} = \emptyset$ }. From the induction hypothesis, the latter is equal to $\text{UB}(\Theta, \overrightarrow{\beta^-} \vdash P')$ not using $\overrightarrow{\beta^-}$, i.e. $\text{UB}(\Theta \vdash \exists \overrightarrow{\beta^-}, P')$.

Case 3. P = |M|

Then let us consider two subcases upper bounds without outer quantifiers (we denote the corresponding set restriction as $|_{\pm}$) and upper bounds with outer quantifiers ($|_{\exists}$). We prove that for both of these groups, the restricted sets are equal.

 $a. \ O \neq \exists \overrightarrow{\beta}^{-}.O'$

Then the last applied rule to infer $\Theta \vdash Q \geqslant \downarrow M$ must be (\downarrow^{\geqslant}) , which means $Q = \downarrow M'$, and by inversion, $\Theta \vdash M' \simeq^{\leq} M$, then by Lemma 34 and (\downarrow^{\simeq^D}) , $\downarrow M' \simeq^D \downarrow M$. This way, $Q = \downarrow M' \in \{\downarrow M' \mid \downarrow M' \simeq^D \downarrow M\} = \mathsf{UB}(\Theta \vdash \downarrow M)|_{\#}.$

In the other direction,

$$\downarrow M' \simeq^D \downarrow M \Rightarrow \Theta \vdash \downarrow M' \simeq^{\leqslant} \downarrow M$$
 by Lemmas 28 and 29
$$\Rightarrow \Theta \vdash \downarrow M' \geqslant \downarrow M$$
 by inversion

b. $Q = \exists \overrightarrow{\beta}$. Q' (for non-empty $\overrightarrow{\beta}$) Then the last rule applied to infer $\Theta \vdash \exists \overrightarrow{\beta}^{-}. Q' \geqslant \downarrow M$ must be (\exists^{\geqslant}) . Inversion of this rule gives us $\Theta \vdash [\overrightarrow{N}/\overrightarrow{\beta^-}]Q' \geqslant \downarrow M$ for some $\Theta \vdash N_i$. Notice that $[\overrightarrow{N}/\overrightarrow{\beta^-}]Q'$ has no outer quantifiers. Thus from case 3.a, $[\vec{N}/\vec{\beta}^-]Q' \simeq^D \downarrow M$, which is only possible if O' = |M'|. This way, $O = \exists \overrightarrow{\beta}^-$. $|M'| \in UB(\Theta + |M|)|_{\exists}$ (notice that $\overrightarrow{\beta}^-$ is not empty).

In the other direction,

$$[\overrightarrow{N}/\overrightarrow{\beta}^{-}] \downarrow M' \simeq^{D} \downarrow M \Rightarrow \Theta \vdash [\overrightarrow{N}/\overrightarrow{\beta}^{-}] \downarrow M' \simeq^{\varsigma} \downarrow M \qquad \text{by Lemmas 28 and 29}$$

$$\Rightarrow \Theta \vdash [\overrightarrow{N}/\overrightarrow{\beta}^{-}] \downarrow M' \geqslant \downarrow M \qquad \text{by inversion}$$

$$\Rightarrow \Theta \vdash \exists \overrightarrow{\beta}^{-}. \downarrow M' \geqslant \downarrow M \qquad \text{by } (\exists^{\geqslant})$$

Lemma 78 (*Characterization of the Normalized Supertypes*). For a normalized positive type $P = \inf(P)$, let us define the set of normalized upper bounds in the following way:

$$\begin{array}{ll} \Theta \vdash P & \text{NFUB}(\Theta \vdash P) \\ \hline \Theta \vdash \beta^{+} & \{\beta^{+}\} \\ \hline \Theta \vdash \exists \overrightarrow{\beta^{-}}.P & \text{NFUB}(\Theta, \overrightarrow{\beta^{-}} \vdash P) \text{ not using } \overrightarrow{\beta^{-}} \\ \hline \Theta \vdash \downarrow M & \left\{ \exists \overrightarrow{\alpha^{-}}. \downarrow M' \; \middle| \begin{array}{l} \text{for } \overrightarrow{\alpha^{-}}, M', \text{ and } \overrightarrow{N} \text{ s.t. ord } \overrightarrow{\alpha^{-}} \text{ in } M' = \overrightarrow{\alpha^{-}}, \\ \Theta \vdash N_{i}, \Theta, \overrightarrow{\alpha^{-}} \vdash M', \text{ and } [\overrightarrow{N}/\overrightarrow{\alpha^{-}}] \downarrow M' = \downarrow M \end{array} \right\}$$

Then NFUB($\Theta \vdash P$) $\equiv \{ \mathsf{nf}(Q) \mid \Theta \vdash Q \geqslant P \}.$

Proof. By induction on $\Theta \vdash P$.

Case 1. $P = \beta^+$

Then from Lemma 77,
$$\{ \mathsf{nf}(Q) \mid \Theta \vdash Q \geqslant \beta^+ \} = \{ \mathsf{nf}(\exists \overrightarrow{\alpha}^-.\beta^+) \mid \mathsf{for some } \overrightarrow{\alpha}^- \} = \{ \beta^+ \}$$

Case 2. $P = \exists \overrightarrow{\beta}^-.P'$

NFUB $(\Theta \vdash \exists \overrightarrow{\beta}^-.P')$

= NFUB $(\Theta, \overrightarrow{\beta}^- \vdash P')$ not using $\overrightarrow{\beta}^-$

= $\{ \mathsf{nf}(Q) \mid \Theta, \overrightarrow{\beta}^- \vdash Q \geqslant P' \}$ not using $\overrightarrow{\beta}^-$ by the induction hypothesis

= $\{ \mathsf{nf}(Q) \mid \Theta, \overrightarrow{\beta}^- \vdash Q \geqslant P' \}$ s.t. $\{ \mathsf{nf}(Q) \mid \overrightarrow{\beta}^- \vdash Q \geqslant P' \}$ by Lemma 40

= $\{ \mathsf{nf}(Q) \mid Q \in \mathsf{UB}(\Theta, \overrightarrow{\beta}^- \vdash P') \}$ by Lemma 77

= $\{ \mathsf{nf}(Q) \mid Q \in \mathsf{UB}(\Theta \vdash \exists \overrightarrow{\beta}^-.P') \}$ by the definition of UB

= $\{ \mathsf{nf}(Q) \mid \Theta \vdash Q \geqslant \exists \overrightarrow{\beta}^-.P' \}$ by Lemma 77

Case 3. $P = \bigcup M$ Let us prove the set equality by two inclusions.

 \subseteq Suppose that $\Theta \vdash Q \geqslant \downarrow M$ and M is normalized.

By Lemma 77, $Q \in UB(\Theta \vdash \downarrow M)$. Then by definition of UB, $Q = \exists \overrightarrow{\alpha}^2 . \downarrow M'$ for some $\overrightarrow{\alpha}^2$, M', and $\Theta \vdash \sigma : \overrightarrow{\alpha}^2$ s.t. $[\sigma] \downarrow M' \simeq^D \downarrow M$.

We need to show that $\operatorname{nf}(Q) \in \operatorname{NFUB}(\Theta \vdash \bigcup M)$. Notice that $\operatorname{nf}(Q) = \operatorname{nf}(\exists \overrightarrow{\alpha}^{-}. \bigcup M') = \exists \overrightarrow{\alpha}^{-}_{0}. \bigcup M_{0}$, where $\operatorname{nf}(M') = M_{0}$ and $\operatorname{ord}(\overrightarrow{\alpha}^{-})$ in $M_{0} = \overrightarrow{\alpha}^{-}_{0}$.

The belonging of $\exists \overrightarrow{\alpha}_0$. $\downarrow M_0$ to NFUB($\Theta \vdash \downarrow M$) means that

- (1) ord $\overrightarrow{\alpha}_0$ in $M_0 = \overrightarrow{\alpha}_0$ and
- (2) that there exists $\Theta \vdash \sigma_0 : \overrightarrow{\alpha}_0^2$ such that $[\sigma_0] \downarrow M_0 = \downarrow M$.

The first requirement holds by Corollary 13. To show the second requirement, we construct σ_0 as nf $(\sigma|_{fvM'})$. Let us show the required properties of σ_0 :

- (1) $\Theta \vdash \sigma_0 : \overrightarrow{\alpha}_0$. Notice that by Lemma 7, $\Theta \vdash \sigma|_{\mathsf{fv}(\underline{M'})} : \overrightarrow{\alpha} \cap \mathsf{fv}(\underline{M'})$, which we rewrite as $\Theta \vdash \sigma|_{\mathsf{fv}(\underline{M'})} : \overrightarrow{\alpha}_0$ (since by Lemma 35 $\overrightarrow{\alpha}_0 = \overrightarrow{\alpha} \cap \mathsf{fv}(\underline{M_0})$ as sets, and $\mathsf{fv}(\underline{M_0}) = \mathsf{fv}(\underline{M'})$ by Lemma 40). Then by Lemma 42, $\Theta \vdash \mathsf{nf}(\sigma|_{\mathsf{fv}(\underline{M'})}) : \overrightarrow{\alpha}_0$, that is $\Theta \vdash \sigma_0 : \overrightarrow{\alpha}_0$.
- (2) $[\sigma_0] \downarrow M_0 = \downarrow M$. $[\sigma] \downarrow M' \simeq^D \downarrow M$ means $[\sigma|_{\mathsf{fv}(M')}] \downarrow M' \simeq^D \downarrow M$ by Lemma 6. Then by Lemma 45, $\mathsf{nf}([\sigma|_{\mathsf{fv}(M')}] \downarrow M') = \mathsf{nf}(\downarrow M)$, implying $[\sigma_0] \downarrow M_0 = \mathsf{nf}(\downarrow M)$ by Lemma 43, and further $[\sigma_0] \downarrow M_0 = \downarrow M$ by Lemma 46 (since $\downarrow M$ is normal by assumption).
- - (1) By definition, $\operatorname{nf}(\exists \overrightarrow{\alpha_0}, \downarrow M_0) = \exists \overrightarrow{\alpha_1}, \downarrow M_1$, where $M_1 = \operatorname{nf}(M_0)$ and $\operatorname{ord} \overrightarrow{\alpha_0} \operatorname{in} M_1 = \overrightarrow{\alpha_1}$. First, notice that by Lemmas 39 and 41, $\operatorname{ord} \overrightarrow{\alpha_0} \operatorname{in} M_1 = \operatorname{ord} \overrightarrow{\alpha_0} \operatorname{in} M_0 = \overrightarrow{\alpha_0}$. This way, $\operatorname{nf}(\exists \overrightarrow{\alpha_0}, \downarrow M_0) = \exists \overrightarrow{\alpha_0}, \downarrow \operatorname{nf}(M_0)$. Second, M_0 is normalized by Lemma 47, since $[\sigma_0] \downarrow M_0 = \downarrow M$ is normal. As such, $\operatorname{nf}(\exists \overrightarrow{\alpha_0}, \downarrow M_0) = \exists \overrightarrow{\alpha_0}, \downarrow M_0$, in other words, $\exists \overrightarrow{\alpha_0}, \downarrow M_0$ is normalized.
 - (2) $\Theta \vdash \exists \overrightarrow{\sigma}_0. \downarrow M_0 \geqslant \downarrow M$ holds immediately by (\exists^{\geqslant}) with the substitution σ_0 . Notice that $\Theta \vdash [\sigma_0] \downarrow M_0 \geqslant \downarrow M$ follows from $[\sigma_0] \downarrow M_0 = \downarrow M$ by reflexivity of subtyping (Lemma 22).

Lemma 79. Upper bounds of a type do not depend on the context as soon as the type is well-formed in it.

If $\Theta_1 \vdash P$ and $\Theta_2 \vdash P$ then $\mathsf{UB}(\Theta_1 \vdash P) = \mathsf{UB}(\Theta_2 \vdash P)$ and $\mathsf{NFUB}(\Theta_1 \vdash P) = \mathsf{NFUB}(\Theta_2 \vdash P)$

Proof. We prove both inclusions by structural induction on P.

Case 1. $P = \beta^+$ Then $UB(\Theta_1 \vdash \beta^+) = UB(\Theta_2 \vdash \beta^+) = \{\exists \overrightarrow{\alpha} \cdot \beta^+ \mid \text{ for some } \overrightarrow{\alpha}^+\}$. NFUB($\Theta_1 \vdash \beta^+$) = NFUB($\Theta_2 \vdash \beta^+$) = $\{\beta^+\}$.

Case 2. $P = \exists \overrightarrow{\beta^-}. P'$. Then $UB(\Theta_1 + \exists \overrightarrow{\beta^-}. P') = UB(\Theta_1, \overrightarrow{\beta^-} + P')$ not using $\overrightarrow{\beta^-}. UB(\Theta_2 + \exists \overrightarrow{\beta^-}. P') = UB(\Theta_2, \overrightarrow{\beta^-} + P')$ not using $\overrightarrow{\beta^-}. By$ the induction hypothesis, $UB(\Theta_1, \overrightarrow{\beta^-} + P') = UB(\Theta_2, \overrightarrow{\beta^-} + P')$, and if we restrict these sets to the same domain, they stay equal. Analogously, $NFUB(\Theta_1 + \exists \overrightarrow{\beta^-}. P') = NFUB(\Theta_2 + \exists \overrightarrow{\beta^-}. P')$.

Case 3. $P = \downarrow M$. Suppose that $\exists \overrightarrow{\alpha}^{-}. \downarrow M' \in \mathsf{UB}(\Theta_1 \vdash \downarrow M)$. It means that $\Theta_1, \overrightarrow{\alpha}^{-} \vdash M'$ and there exist $\Theta_1 \vdash \overrightarrow{N}$ s.t. $[\overrightarrow{N}/\overrightarrow{\alpha}^{-}] \downarrow M' \simeq^D \downarrow M$, or in other terms, there exists $\Theta_1 \vdash \sigma : \overrightarrow{\alpha}^{-}$ such that $[\sigma] \downarrow M' \simeq^D \downarrow M$.

We need to show that $\exists \overrightarrow{\alpha}^{-}. \downarrow M' \in UB(\Theta_2 \vdash \downarrow M)$, in other words, $\Theta_2, \overrightarrow{\alpha}^{-} \vdash M'$ and there exists $\Theta_2 \vdash \sigma_0 : \overrightarrow{\alpha}^{-}$ such that $[\sigma_0] \downarrow M' \simeq^D \downarrow M$.

First, let us show $\Theta_2, \overrightarrow{\alpha^-} \vdash M'$. Notice that $[\sigma] \downarrow M' \simeq^D \downarrow M$ implies $\mathsf{fv}([\sigma]M') = \mathsf{fv}(\downarrow M)$ by Lemma 26. By Lemma 15, $\mathsf{fv}(\underline{M'}) \setminus \overrightarrow{\alpha^-} \subseteq \mathsf{fv}([\sigma]M')$. This way, $\mathsf{fv}(\underline{M'}) \setminus \overrightarrow{\alpha^-} \subseteq \mathsf{fv}(\underline{M})$, implying $\mathsf{fv}(\underline{M'}) \subseteq \mathsf{fv}(\underline{M}) \cup \overrightarrow{\alpha^-}$. By Lemma 3, $\Theta_2 \vdash \downarrow M$ implies $\mathsf{fv}M \subseteq \Theta_2$, hence, $\mathsf{fv}M' \subseteq (\Theta_2, \overrightarrow{\alpha^-})$, which by Corollary 1 means $\Theta_2, \overrightarrow{\alpha^-} \vdash M'$.

Second, let us construct the required σ_0 in the following way:

$$\begin{cases} [\sigma_0]\alpha_i^- = [\sigma]\alpha_i^- & \text{for } \alpha_i^- \in \overrightarrow{\alpha} \cap \text{fv } (M') \\ [\sigma_0]\alpha_i^- = \forall \gamma^+. \uparrow \gamma^+ & \text{for } \alpha_i^- \in \overrightarrow{\alpha} \setminus \text{fv } (M') \\ [\sigma_0]\gamma^{\pm} = \gamma^{\pm} & \text{for any other } \gamma^{\pm} \end{cases}$$

This construction of a substitution coincides with the one from the proof of Lemma 20. This way, for σ_0 , hold the same properties:

- (1) $[\sigma_0]M' = [\sigma]M'$, which in particular, implies $[\sigma_0] \downarrow M = [\sigma] \downarrow M$, and thus, $[\sigma] \downarrow M' \simeq^D \downarrow M$ can be rewritten to $[\sigma_0] \downarrow M' \simeq^D \downarrow M$; and
- (2) $\mathsf{fv}([\sigma]M') \vdash \sigma_0 : \overrightarrow{\alpha}$, which, as noted above, can be rewritten to $\mathsf{fv}(M) \vdash \sigma_0 : \overrightarrow{\alpha}$, and since $\mathsf{fv}M \subseteq \Theta_2$, weakened to $\Theta_2 \vdash \sigma_0 : \overrightarrow{\alpha}$.

The proof of NFUB($\Theta_1 \vdash \downarrow M$) \subseteq NFUB($\Theta_2 \vdash \downarrow M$) is analogous. The differences are:

- (1) ord $\overrightarrow{\alpha}$ in $M' = \overrightarrow{\alpha}$ holds by assumption,
- (2) $[\sigma] \downarrow M' = \downarrow M$ implies fv $([\sigma]M') = \text{fv}(\downarrow M)$ by rewriting,
- (3) $[\sigma] \downarrow M' = \downarrow M$ and $[\sigma_0] \downarrow M = [\sigma] \downarrow M$ imply $[\sigma_0] \downarrow M' = \downarrow M$ by rewriting.

Lemma 80 (Soundness of the Least Upper Bound). For types $\Theta \vdash P_1$, and $\Theta \vdash P_2$, if $\Theta \models P_1 \lor P_2 = Q$ then

(i) $\Theta \vdash Q$

, Vol. 1, No. 1, Article . Publication date: July 2024.

(ii) $\Theta \vdash Q \geqslant P_1$ and $\Theta \vdash Q \geqslant P_2$

 Proof. Induction on $\Theta \models P_1 \lor P_2 = Q$.

Case 1. $\Theta \models \alpha^+ \lor \alpha^+ = \alpha^+$

Then $\Theta \vdash \alpha^+$ by assumption, and $\Theta \vdash \alpha^+ \geqslant \alpha^+$ by (VAR_+^{\geqslant}) .

Case 2. $\Theta \models \exists \overrightarrow{\alpha}^2 . P_1 \lor \exists \overrightarrow{\beta}^2 . P_2 = Q$

Then by inversion of $\Theta \vdash \exists \overrightarrow{\alpha}$. P_i and weakening, $\Theta, \overrightarrow{\alpha}, \overrightarrow{\beta}^{\perp} \vdash P_i$, hence, the induction hypothesis applies to $\Theta, \overrightarrow{\alpha}, \overrightarrow{\beta}^{\perp} \models P_1 \lor P_2 = Q$. Then

- (i) $\Theta, \overrightarrow{\alpha}, \overrightarrow{\beta} \vdash Q$,
- (ii) $\Theta, \overrightarrow{\alpha}, \overrightarrow{\beta} \vdash Q \geqslant P_1$,
- (iii) $\Theta, \overrightarrow{\alpha}, \overrightarrow{\beta} \vdash Q \geq P_2$.

To prove $\Theta \vdash Q$, it suffices to show that $\mathsf{fv}(Q) \cap (\Theta, \overrightarrow{\alpha}^2, \overrightarrow{\beta}^-) = \mathsf{fv}(Q) \cap \Theta$ (and then apply Lemma 4). The inclusion right-to-left is self-evident. To show $\mathsf{fv}(Q) \cap (\Theta, \overrightarrow{\alpha}^2, \overrightarrow{\beta}^-) \subseteq \mathsf{fv}(Q) \cap \Theta$, we prove that $\mathsf{fv}(Q) \subseteq \Theta$.

To show $\Theta \vdash Q \geqslant \exists \overrightarrow{\alpha}^{-}. P_{1}$, we apply (\exists^{\geqslant}) . Then $\Theta, \overrightarrow{\alpha}^{-} \vdash Q \geqslant P_{1}$ holds since $\Theta, \overrightarrow{\alpha}^{-}, \overrightarrow{\beta}^{-} \vdash Q \geqslant P_{1}$ (by the induction hypothesis), $\Theta, \overrightarrow{\alpha}^{-} \vdash Q$ (by weakening), and $\Theta, \overrightarrow{\alpha}^{-} \vdash P_{1}$.

Judgment $\Theta \vdash Q \geqslant \exists \overrightarrow{\beta}^{-}$. P_2 is proved symmetrically.

Case 3. $\Theta \models JN \lor JM = \exists \overrightarrow{\alpha}^2 . [\overrightarrow{\alpha}^2/\widehat{\Theta}] P$. By the inversion, $\Theta, \cdot \models \mathsf{nf}(JN) \stackrel{a}{\simeq} \mathsf{nf}(JM) = (\widehat{\Theta}, P, \widehat{\tau}_1, \widehat{\tau}_2)$. Then by the soundness of anti-unification (Lemma 74),

(i) Θ ; $\widehat{\Theta} \vdash P$, then by Lemma 61,

$$\Theta, \overrightarrow{\alpha}^{-} \vdash [\overrightarrow{\alpha}^{-}/\widehat{\Theta}] \underline{P} \tag{7}$$

(ii) Θ ; $\cdot \vdash \widehat{\tau}_1 : \widehat{\Theta}$ and Θ ; $\cdot \vdash \widehat{\tau}_2 : \widehat{\Theta}$. Assuming that $\widehat{\Theta} = \widehat{\beta}_1^-, ..., \widehat{\beta}_n^-$, the antiunification solutions $\widehat{\tau}_1$ and $\widehat{\tau}_2$ can be put explicitly as $\widehat{\tau}_1 = (\widehat{\beta}_1^- :\simeq N_1, ..., \widehat{\beta}_n^- :\simeq N_n)$, and $\widehat{\tau}_2 = (\widehat{\beta}_1^- :\simeq M_1, ..., \widehat{\beta}_n^- :\simeq M_n)$. Then

$$\widehat{\tau}_1 = (\overrightarrow{N}/\overrightarrow{\alpha}) \circ (\overrightarrow{\alpha}/\widehat{\Theta}) \tag{8}$$

$$\widehat{\tau}_2 = (\overrightarrow{M}/\overrightarrow{\alpha}) \circ (\overrightarrow{\alpha}/\widehat{\Theta}) \tag{9}$$

(iii) $[\widehat{\tau}_1] Q = P_1$ and $[\widehat{\tau}_2] Q = P_1$, which, by 8 and 9, means

$$[\overrightarrow{N}/\overrightarrow{\alpha}][\overrightarrow{\alpha}/\widehat{\Theta}]P = \text{nf}(\downarrow N)$$
 (10)

$$[\overrightarrow{M}/\overrightarrow{\alpha}][\overrightarrow{\alpha}]\overrightarrow{\Theta}]\underline{P} = \mathsf{nf}(\downarrow M) \tag{11}$$

Then $\Theta \vdash \exists \overrightarrow{\alpha}$. $[\overrightarrow{\alpha}] P$ follows directly from 7.

To show $\Theta \vdash \exists \overrightarrow{\alpha}^{-}. [\overrightarrow{\alpha}^{-}/\widehat{\Theta}] P \geqslant \downarrow N$, we apply $(\exists^{\triangleright})$, instantiating $\overrightarrow{\alpha}^{-}$ with \overrightarrow{N} . Then $\Theta \vdash [\overrightarrow{N}/\overrightarrow{\alpha}^{-}][\overrightarrow{\alpha}^{-}/\widehat{\Theta}] P \geqslant \downarrow N$ follows from 10 and since $\Theta \vdash \mathsf{nf}(\downarrow N) \geqslant \downarrow N$ (by Corollary 16).

Analogously, instantiating $\overrightarrow{\alpha}$ with \overrightarrow{M} , gives us $\Theta \vdash [\overrightarrow{M}/\overrightarrow{\alpha}][\overrightarrow{\alpha}/\widehat{\Theta}] P \geqslant \downarrow M$ (from 11), and hence, $\Theta \vdash \overrightarrow{\exists \alpha}.[\overrightarrow{\alpha}/\widehat{\Theta}] P \geqslant \downarrow M$.

Lemma 81 (*Completeness and Initiality of the Least Upper Bound*). For types $\Theta \vdash P_1$, $\Theta \vdash P_2$, and $\Theta \vdash Q \Rightarrow P_1$ and $\Theta \vdash Q \Rightarrow P_2$, there exists Q' s.t. $\Theta \models P_1 \lor P_2 = Q'$ and $\Theta \vdash Q \Rightarrow Q'$.

Proof. Induction on the pair (P_1, P_2) . From Lemma 78, $Q \in UB(\Theta \vdash P_1) \cap UB(\Theta \vdash P_2)$. Let us consider the cases of what P_1 and P_2 are (i.e. the last rules to infer $\Theta \vdash P_i$).

Case 1. $P_1 = \exists \overrightarrow{\beta_1}, Q_1, P_2 = \exists \overrightarrow{\beta_2}, Q_2$, where either $\overrightarrow{\beta_1}$ or $\overrightarrow{\beta_2}$ is not empty

Then

It means that $\Theta, \overrightarrow{\beta^-}_1, \overrightarrow{\beta^-}_2 \vdash Q \geqslant Q_1$ and $\Theta, \overrightarrow{\beta^-}_1, \overrightarrow{\beta^-}_2 \vdash Q \geqslant Q_2$. Then the next step of the algorithm—the recursive call $\Theta, \overrightarrow{\beta^-}_1, \overrightarrow{\beta^-}_2 \models Q_1 \lor Q_2 = Q'$ terminates by the induction hypothesis, and moreover, $\Theta, \overrightarrow{\beta^-}_1, \overrightarrow{\beta^-}_2 \vdash Q \geqslant Q'$. This way, the result of the algorithm is Q', i.e. $\Theta \models P_1 \lor P_2 = Q'$.

Since both Q and Q' are sound upper bounds, $\Theta \vdash Q$ and $\Theta \vdash Q'$, and therefore, Θ , $\overrightarrow{\beta^-}_1$, $\overrightarrow{\beta^-}_2 \vdash Q \geqslant Q'$ can be strengthened to $\Theta \vdash Q \geqslant Q'$ by Lemma 20.

Case 2. $P_1 = \alpha^+$ and $P_2 = \downarrow N$

 Then the set of common upper bounds of $\downarrow N$ and α^+ is empty, and thus, $Q \in \mathsf{UB}(\Theta \vdash P_1) \cap \mathsf{UB}(\Theta \vdash P_2)$ gives a contradiction:

$$Q \in UB(\Theta \vdash \alpha^{+}) \cap UB(\Theta \vdash \downarrow N)
= \{\exists \overrightarrow{\alpha} \cdot \alpha^{+} \mid \cdots \} \cap \{\exists \overrightarrow{\beta}^{-} \cdot \downarrow M' \mid \cdots \}$$
 by the definition of UB

$$= \emptyset$$
 since $\alpha^{+} \neq \downarrow M'$ for any M'

Case 3. $P_1 = \bigcup N$ and $P_2 = \alpha^+$ Symmetric to case 2

Case 4. $P_1 = \alpha^+$ and $P_2 = \beta^+$ (where $\beta^+ \neq \alpha^+$)

Similarly to case 2, the set of common upper bounds is empty, which leads to the contradiction:

$$Q \in \mathsf{UB}(\Theta \vdash \alpha^{+}) \cap \mathsf{UB}(\Theta \vdash \beta^{+})$$

$$= \{\exists \overrightarrow{\alpha} . \alpha^{+} \mid \cdots \} \cap \{\exists \overrightarrow{\beta}^{-} . \beta^{+} \mid \cdots \}$$
 by the definition of UB
$$= \emptyset$$
 since $\alpha^{+} \neq \beta^{+}$

Case 5. $P_1 = \alpha^+$ and $P_2 = \alpha^+$

Then the algorithm terminates in one step ((VAR $^{\vee}$)) and the result is α^+ , i.e. $\Theta \models \alpha^+ \lor \alpha^+ = \alpha^+$.

Since $Q \in UB(\Theta \vdash \alpha^+)$, $Q = \exists \overrightarrow{\alpha} \cdot \alpha^+$. Then $\Theta \vdash \exists \overrightarrow{\alpha} \cdot \alpha^+ \geqslant \alpha^+$ by $(\exists^{\geqslant}) : \overrightarrow{\alpha}$ can be instantiated with arbitrary negative types (for example $\forall \beta^+, \uparrow \beta^+$), since the substitution for unused variables does not change the term $[\overrightarrow{N}/\overrightarrow{\alpha}]\alpha^+ = \alpha^+$, and then $\Theta \vdash \alpha^+ \geqslant \alpha^+$ by (VAR_+^{\geqslant}) .

Case 6. $P_1 = \downarrow M_1$ and $P_2 = \downarrow M_2$

In the next step, the algorithm tries to anti-unify $\mathsf{nf}(\downarrow M_1)$ and $\mathsf{nf}(\downarrow M_2)$. By Lemma 75, to show that the anti-unification algorithm terminates, it suffices to demonstrate that a sound

anti-unification solution exists. Notice that

```
\begin{split} & \mathsf{nf}\left( \mathcal{Q} \right) \in \mathsf{NFUB}(\Theta \vdash \mathsf{nf}\left( \downarrow M_1 \right)) \cap \mathsf{NFUB}(\Theta \vdash \mathsf{nf}\left( \downarrow M_2 \right)) \\ & = \mathsf{NFUB}(\Theta \vdash \mathsf{\downarrow}\mathsf{nf}\left( M_1 \right)) \cap \mathsf{NFUB}(\Theta \vdash \mathsf{\downarrow}\mathsf{nf}\left( M_2 \right)) \\ & \left\{ \exists \overrightarrow{\alpha^2}. \downarrow M' \middle| \begin{array}{c} \mathsf{for} \ \overrightarrow{\alpha^2}, M', \, \mathsf{and} \ \overrightarrow{N} \, \mathsf{s.t.} \, \mathsf{ord} \ \overrightarrow{\alpha^2} \, \mathsf{in} \, M' = \overrightarrow{\alpha^2}, \\ \Theta \vdash N_i, \, \Theta, \overrightarrow{\alpha^2} \vdash M', \, \mathsf{and} \ \overrightarrow{N} \, \mathsf{s.t.} \, \mathsf{ord} \ \overrightarrow{\alpha^2} \, \mathsf{j} \downarrow M' = \mathsf{\downarrow}\mathsf{nf}\left( M_1 \right) \end{array} \right\} \\ & = \left\{ \begin{array}{c} \bigcap \\ \left\{ \exists \overrightarrow{\alpha^2}. \downarrow M' \middle| \begin{array}{c} \mathsf{for} \ \overrightarrow{\alpha^2}, M', \, \mathsf{and} \ \overrightarrow{N} \, \mathsf{s.t.} \, \mathsf{ord} \ \overrightarrow{\alpha^2} \, \mathsf{in} \, M' = \overrightarrow{\alpha^2}, \\ \Theta \vdash \overrightarrow{N_1}, \, \Theta \vdash \overrightarrow{N_2}, \, \Theta, \, \overrightarrow{\alpha^2} \vdash M', \\ \mathsf{and} \ \overrightarrow{[N/\alpha^2]} \, \mathsf{j} \downarrow M' = \mathsf{j}\mathsf{nf}\left( M_2 \right) \end{array} \right. \\ & = \left\{ \begin{array}{c} \exists \overrightarrow{\alpha^2}. \downarrow M' \middle| \begin{array}{c} \mathsf{for} \ \overrightarrow{\alpha^2}, M', \, \overrightarrow{N_1} \, \mathsf{and} \ \overrightarrow{N_2} \, \mathsf{s.t.} \, \mathsf{ord} \ \overrightarrow{\alpha^2} \, \mathsf{in} \, M' = \overrightarrow{\alpha^2}, \\ \Theta \vdash \overrightarrow{N_1}, \, \Theta \vdash \overrightarrow{N_2}, \, \Theta, \, \overrightarrow{\alpha^2} \vdash M', \, [\overrightarrow{N_1}/\overrightarrow{\alpha^2}] \, \mathsf{j} M' = \mathsf{j}\mathsf{nf}\left( M_1 \right) \\ \mathsf{,} \, \mathsf{and} \ [\overrightarrow{N_2}/\overrightarrow{\alpha^2}] \, \mathsf{j} M' = \mathsf{j}\mathsf{nf}\left( M_2 \right) \end{array} \right. \end{split} \right\} \end{split}
```

The fact that the latter set is non-empty means that there exist $\overrightarrow{\alpha}$, \overrightarrow{N} , \overrightarrow{N}_1 and \overrightarrow{N}_2 such that

- (i) $\Theta, \overrightarrow{\alpha} \vdash M'$ (notice that M' is normal)
- (ii) $\Theta \vdash \overrightarrow{N}_1$ and $\Theta \vdash \overrightarrow{N}_1$,

(iii)
$$[\overrightarrow{N}_1/\overrightarrow{\alpha}^-] \downarrow M' = \inf(M_1)$$
 and $[\overrightarrow{N}_2/\overrightarrow{\alpha}^-] \downarrow M' = \inf(M_2)$

For each negative variable α^- from $\overrightarrow{\alpha}$, let us choose a fresh negative anti-unification variable $\widehat{\alpha}$, and denote the list of these variables as $\widehat{\alpha}$. Let us show that $(\widehat{\alpha}, [\widehat{\alpha}/\widehat{\alpha}] \downarrow M', \overrightarrow{N_1}/\widehat{\alpha}, \overrightarrow{N_2}/\widehat{\alpha})$ is a sound anti-unifier of $(\downarrow M_1)$ and $(\downarrow M_2)$ in context Θ :

- $\overrightarrow{\widehat{\alpha}}$ is negative by construction,
- Θ ; $\overrightarrow{\alpha}^- \vdash [\overrightarrow{\alpha}^-/\overrightarrow{\alpha}^-] \rfloor M'$ because Θ , $\overrightarrow{\alpha}^- \vdash \rfloor M'$ (Lemma 60),
- Θ ; $\vdash (\overrightarrow{N}_1/\overrightarrow{\widehat{\alpha}})$: $\overrightarrow{\widehat{\alpha}}$ because $\Theta \vdash \overrightarrow{N}_1$ and Θ ; $\vdash (\overrightarrow{N}_2/\overrightarrow{\widehat{\alpha}})$: $\overrightarrow{\widehat{\alpha}}$ because $\Theta \vdash \overrightarrow{N}_2$,
- $[\overrightarrow{N}_1/\overrightarrow{\alpha}^-][\overrightarrow{\alpha}^-/\overrightarrow{\alpha}^-] \downarrow M' = [\overrightarrow{N}_1/\overrightarrow{\alpha}^-] \downarrow M' = \inf(M_1) = \inf(\downarrow M_1).$
- $[\overrightarrow{N}_2/\overrightarrow{\widehat{\alpha}}][\overrightarrow{\widehat{\alpha}}/\overrightarrow{\alpha}] \downarrow M' = [\overrightarrow{N}_2/\overrightarrow{\alpha}] \downarrow M' = \inf(M_2) = \inf(\downarrow M_2).$

Then by the completeness of the anti-unification (Lemma 75), the anti-unification algorithm terminates, so is the Least Upper Bound algorithm invoking it, i.e. $Q' = \exists \overrightarrow{\beta}^-$. $[\overrightarrow{\beta}^-/\widehat{\Theta}] P$, where $(\widehat{\Theta}, P, \widehat{\tau}_1, \widehat{\tau}_2)$ is the result of the anti-unification of $\mathsf{nf}(\downarrow M_1)$ and $\mathsf{nf}(\downarrow M_2)$ in context Θ .

Moreover, Lemma 75 also says that the found anti-unification solution is initial, i.e. there exists $\widehat{\tau}$ such that Θ ; $\widehat{\Theta} \vdash \widehat{\tau} : \overrightarrow{\widehat{\alpha}}$ and $\widehat{\tau} \upharpoonright \widehat{\alpha} / \overrightarrow{\alpha} \upharpoonright \backslash M' = P$.

Let σ be a sequential Kleisli composition of the following substitutions: (i) $\overrightarrow{\alpha} / \overrightarrow{\alpha}$, (ii) $\overrightarrow{\tau}$, and (iii) $\overrightarrow{\beta} / \widehat{\Theta}$. Notice that Θ , $\overrightarrow{\beta} + \sigma : \overrightarrow{\alpha}$ and $[\sigma] \downarrow M' = [\overrightarrow{\beta} / \widehat{\Theta}] [\widehat{\tau}] [\overrightarrow{\alpha} / \overrightarrow{\alpha}] \downarrow M' = [\overrightarrow{\beta} / \widehat{\Theta}] P$. In particular, from the reflexivity of subtyping: Θ , $\overrightarrow{\beta} + [\sigma] \downarrow M' > [\overrightarrow{\beta} / \widehat{\Theta}] P$.

It allows us to show $\Theta \vdash \mathsf{nf}(Q) \geqslant Q'$, i.e. $\Theta \vdash \exists \overrightarrow{\alpha} : \downarrow M' \geqslant \exists \overrightarrow{\beta} : [\overrightarrow{\beta}] \not P$, by applying (\exists^{\geqslant}) , instantiating $\overrightarrow{\alpha}$ with respect to σ . Finally, $\Theta \vdash Q \geqslant Q'$ by transitively combining $\Theta \vdash \mathsf{nf}(Q) \geqslant Q'$ and $\Theta \vdash Q \geqslant \mathsf{nf}(Q)$ (holds by Corollary 16 and inversion).

3.3.9 *Upgrade.* Let us consider a type P well-formed in Θ . Some of its Θ -supertypes are also well-formed in a smaller context $\Theta_0 \subseteq \Theta$. The upgrade is the operation that returns the least of such supertypes.

Observation 11 (*Upgrade determinism*). Assuming *P* is well-formed in $\Theta \subseteq \Theta_0$, if upgrade $\Theta \vdash P$ to $\Theta_0 = Q$ and upgrade $\Theta \vdash P$ to $\Theta_0 = Q'$ are defined then Q = Q'.

Proof. It follows directly from Observation 10, and the convention that the fresh variables are chosen by a fixed deterministic algorithm (Section 1.2.2).

Lemma 82 (Soundness of Upgrade). Assuming P is well-formed in $\Theta = \Theta_0$, $\overrightarrow{\alpha^{\pm}}$, if upgrade $\Theta \vdash P$ to $\Theta_0 = Q$ then

(1) $\Theta_0 \vdash \bigcirc$

 (2) $\Theta \vdash O \geqslant P$

Lemma 103 (Soundness of Upgrade). Assuming P is well-formed in $\Theta = \Theta_0$, $\overrightarrow{\alpha^{\pm}}$, if upgrade $\Theta \vdash P$ to $\Theta_0 = Q$ then

- (1) $\Theta_0 \vdash Q$
- (2) $\Theta \vdash Q \geqslant P$

Proof. By inversion, upgrade $\Theta \vdash P$ to $\Theta_0 = Q$ means that for fresh $\overrightarrow{\beta^{\pm}}$ and $\overrightarrow{\gamma^{\pm}}$, Θ_0 , $\overrightarrow{\beta^{\pm}}$, $\overrightarrow{\gamma^{\pm}} \models [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P \lor [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}]P = Q$. Then by the soundness of the least upper bound (Lemma 80),

- (1) $\Theta_0, \overrightarrow{\beta^{\pm}}, \overrightarrow{\gamma^{\pm}} \vdash \underline{Q},$
- (2) $\Theta_0, \overrightarrow{\beta^{\pm}}, \overrightarrow{\gamma^{\pm}} \vdash Q \geqslant [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}] P$, and
- (3) $\Theta_0, \overrightarrow{\beta^{\pm}}, \overrightarrow{\gamma^{\pm}} \vdash Q \geqslant [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}] \overset{\textbf{P}}{.}$

, Vol. 1, No. 1, Article . Publication date: July 2024.

fv
$$Q \subseteq \text{fv} [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}] P \cap \text{fv} [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}] P$$
 by Lemma 17, fv $Q \subseteq \text{fv} [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}] P$ and fv $Q \subseteq \text{fv} [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}] P$

$$\subseteq ((\text{fv} P \setminus \overrightarrow{\alpha^{\pm}}) \cup \overrightarrow{\beta^{\pm}}) \cap ((\text{fv} P \setminus \overrightarrow{\alpha^{\pm}}) \cup \overrightarrow{\gamma^{\pm}})$$

$$= (\text{fv} P \setminus \overrightarrow{\alpha^{\pm}}) \cap (\text{fv} P \setminus \overrightarrow{\alpha^{\pm}})$$
 since $\overrightarrow{\beta^{\pm}}$ and $\overrightarrow{\gamma^{\pm}}$ are fresh
$$= \text{fv} P \setminus \overrightarrow{\alpha^{\pm}}$$

$$\subseteq \Theta \setminus \overrightarrow{\alpha^{\pm}}$$
 since P is well-formed in Θ

$$\subseteq \Theta_0$$

This way, by Lemma 4, $\Theta_0 \vdash Q$.

Let us apply $\overrightarrow{\alpha^{\pm}}/\overrightarrow{\beta^{\pm}}$ —the inverse of the substitution $\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}$ to both sides of Θ_0 , $\overrightarrow{\beta^{\pm}}, \overrightarrow{\gamma^{\pm}} \vdash \overrightarrow{Q} \geqslant [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$ and by Lemma 23 (since $\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}$ can be specified as Θ_0 , $\overrightarrow{\beta^{\pm}}, \overrightarrow{\gamma^{\pm}} \vdash \overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}} : \Theta_0$, $\overrightarrow{\alpha^{\pm}}, \overrightarrow{\gamma^{\pm}} \vdash [\overrightarrow{\alpha^{\pm}}/\overrightarrow{\beta^{\pm}}]Q \geqslant P$. Notice that $\Theta_0 \vdash Q$ implies that $f \lor Q \cap \overrightarrow{\beta^{\pm}} = \emptyset$, then by Corollary 3, $[\overrightarrow{\alpha^{\pm}}/\overrightarrow{\beta^{\pm}}]Q = Q$, and thus Θ_0 , $\overrightarrow{\alpha^{\pm}}, \overrightarrow{\gamma^{\pm}} \vdash Q \geqslant P$. By context strengthening, Θ_0 , $\overrightarrow{\alpha^{\pm}} \vdash Q \geqslant P$.

Lemma 83 (Completeness and Initiality of Upgrade). The upgrade returns the least Θ -supertype of \underline{P} well-formed in Θ_0 . Assuming \underline{P} is well-formed in $\Theta = \Theta_0$, $\overrightarrow{\alpha^{\pm}}$, For any \underline{O}' such that

- (1) $\Theta_0 \vdash Q'$ and
- (2) $\Theta \vdash Q' \geqslant P$,

the result of the upgrade algorithm Q exists (upgrade $\Theta \vdash P$ to $\Theta_0 = Q$) and satisfies $\Theta_0 \vdash Q' \geqslant Q$.

Proof. Let us consider fresh (not intersecting with Θ) $\overrightarrow{\beta^{\pm}}$ and $\overrightarrow{\gamma^{\pm}}$.

If we apply substitution $\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}$ to both sides of Θ_0 , $\overrightarrow{\alpha^{\pm}} \vdash Q' \geqslant P$, we have Θ_0 , $\overrightarrow{\beta^{\pm}} \vdash [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]Q' \geqslant [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$, which by Corollary 3, since $\overrightarrow{\alpha^{\pm}}$ is disjoint from fv (Q') (because $\Theta_0 \vdash Q'$), simplifies to Θ_0 , $\overrightarrow{\beta^{\pm}} \vdash Q' \geqslant [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$.

Analogously, if we apply substitution $\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}$ to both sides of Θ_0 , $\overrightarrow{\alpha^{\pm}} \vdash \overrightarrow{Q'} \geqslant \overrightarrow{P}$, we have Θ_0 , $\overrightarrow{\gamma^{\pm}} \vdash \overrightarrow{Q'} \geqslant [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}] \overrightarrow{P}$.

This way, Q' is a common supertype of $[\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$ and $[\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}]P$ in context $\Theta_0, \overrightarrow{\beta^{\pm}}, \overrightarrow{\gamma^{\pm}}$. It means that we can apply the completeness of the least upper bound (Lemma 81):

- (1) there exists Q s.t. $\Theta \models [\overrightarrow{\beta^{\pm}}/\overrightarrow{\alpha^{\pm}}]P \lor [\overrightarrow{\gamma^{\pm}}/\overrightarrow{\alpha^{\pm}}]P = Q$
- (2) $\Theta \vdash Q' \geqslant Q$.

The former means that the upgrade algorithm terminates and returns Q. The latter means that since both Q' and Q are well-formed in Θ_0 and Θ , by Lemma 20, $\Theta_0 \vdash Q' \geqslant Q$.

6273 3.3.10 Constraint Satisfaction.

 Lemma 84 (Any constraint is satisfiable). Suppose that $\Xi \vdash C$ and $\widehat{\Theta}$ is a set such that $dom(C) \subseteq \widehat{\Theta} \subseteq dom(\Xi)$. Then there exists $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$ and $\Xi \vdash \widehat{\sigma} : C$.

Proof. Let us define $\widehat{\sigma}$ on dom (C) in the following way:

$$[\widehat{\sigma}]\widehat{\alpha}^{\pm} = \begin{cases} P & \text{if } (\widehat{\alpha}^{\pm} : \cong P) \in C \\ P & \text{if } (\widehat{\alpha}^{\pm} : \geqslant P) \in C \\ N & \text{if } (\widehat{\alpha}^{\pm} : \cong N) \in C \\ \exists \beta^{-}. \downarrow \beta^{-} & \text{if } \widehat{\alpha}^{\pm} = \widehat{\alpha}^{+} \in \widehat{\Theta} \setminus \text{dom } (C) \\ \forall \beta^{+}. \uparrow \beta^{+} & \text{if } \widehat{\alpha}^{\pm} = \widehat{\alpha}^{-} \in \widehat{\Theta} \setminus \text{dom } (C) \end{cases}$$

Then $\Xi \vdash \widehat{\sigma} : C$ follows immediately from the reflexivity of equivalence and subtyping (Lemma 22) and the corresponding rules $(:\cong^{\mathsf{SAT}}_+)$, $(:\cong^{\mathsf{SAT}}_+)$, and $(:\geqslant^{\mathsf{SAT}}_+)$.

Lemma 85 (Constraint Entry Satisfaction is Stable under Equivalence).

- If $\Theta \vdash N_1 : e$ and $\Theta \vdash N_1 \simeq^{\leqslant} N_2$ then $\Theta \vdash N_2 : e$.
- + If $\Theta \vdash P_1 : e$ and $\Theta \vdash P_1 \simeq^{\leq} P_2$ then $\Theta \vdash P_2 : e$.

Proof. – Then e has form $(\widehat{\alpha}^- :\simeq M)$, and by inversion, $\Theta \vdash N_1 \simeq^{\leq} M$. Then by transitivity, $\Theta \vdash N_2 \simeq^{\leq} M$, meaning $\Theta \vdash N_2 : e$.

+ Let us consider what form *e* has.

Case 1. $e = (\widehat{\alpha}^+ :\simeq Q)$. Then $\Theta \vdash P_1 \simeq^{\leq} Q$, and hence, $\Theta \vdash P_2 \simeq^{\leq} Q$ by transitivity. Then $\Theta \vdash P_2 : e$.

Case 2. $e = (\widehat{\alpha}^+ : \ge Q)$. Then $\Theta \vdash P_1 \ge Q$, and hence, $\Theta \vdash P_2 \ge Q$ by transitivity. Then $\Theta \vdash P_2 : e$.

Corollary 28 (Constraint Satisfaction is stable under Equivalence).

```
If \Xi \vdash \widehat{\sigma}_1 : C and \Xi \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : \mathsf{dom}(C) then \Xi \vdash \widehat{\sigma}_2 : C;
```

if $\Xi \vdash \widehat{\sigma}_1 : UC$ and $\Xi \vdash \widehat{\sigma}_1 \simeq^{\leqslant} \widehat{\sigma}_2 : dom(C)$ then $\Xi \vdash \widehat{\sigma}_2 : UC$.

Corollary 29 (Normalization preserves Constraint Satisfaction).

If $\Xi \vdash \widehat{\sigma} : C$ then $\Xi \vdash \mathsf{nf}(\widehat{\sigma}) : C$;

if $\Xi \vdash \widehat{\sigma} : UC$ then $\Xi \vdash \mathsf{nf}(\widehat{\sigma}) : UC$.

3.3.11 Positive Subtyping.

Observation 13 (*Positive Subtyping is Deterministic*). For fixed Θ , Ξ , P, and Q, if Θ ; $\Xi \models P \geqslant Q \Rightarrow C$ and Θ ; $\Xi \models P \geqslant Q \Rightarrow C'$ then C = C'.

Proof. We prove it by induction on Θ ; $\Xi \models P \geqslant Q \dashv C$. First, it is easy to see that the rule applied to infer Θ ; $\Xi \models P \geqslant Q \dashv C$ uniquely depends on the input, and those, it is the same rule that is inferring Θ ; $\Xi \models P \geqslant Q \dashv C'$. Second, the premises of each rule are deterministic on the input:

unification is deterministic by Observation 7, upgrade is deterministic by Observation 11, the choice of the fresh algorithmic variables is deterministic by convention, as discussed in Section 1.2.2, positive subtyping by the induction hypothesis. \Box

Lemma 86 (Soundness of the Positive Subtyping). If $\Theta \vdash^{\supseteq} \Xi$, $\Theta \vdash Q$, Θ ; dom $(\Xi) \vdash P$, and Θ ; $\Xi \vdash P \geqslant Q \dashv C$, then $\Xi \vdash C : \text{fav}(P)$ and for any normalized $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : C$, $\Theta \vdash [\widehat{\sigma}]P \geqslant Q$.

Proof. We prove it by induction on Θ ; $\Xi \models P \geqslant Q \dashv C$. Let us consider the last rule to infer this judgment.

Case 1. (UVAR $^{\geqslant}$) then Θ ; $\Xi \models P \geqslant Q \dashv C$ has shape Θ ; $\Xi \models \widehat{\alpha}^{+} \geqslant P' \dashv (\widehat{\alpha}^{+} : \geqslant Q')$ where $\widehat{\alpha}^{+} \{\Theta_{0}\} \in \Xi$ and upgrade $\Theta \vdash P'$ to $\Theta_{0} = Q'$.

Notice that $\widehat{\alpha}^+ \{\Theta_0\} \in \Xi$ and $\Theta \vdash^{\supseteq} \Xi$ implies $\Theta = \Theta_0$, $\overrightarrow{\alpha^{\pm}}$ for some $\overrightarrow{\alpha^{\pm}}$, hence, the soundness of upgrade (Lemma 103) is applicable:

(1) $\Theta_0 \vdash Q'$ and

 (2) $\Theta \vdash Q' \geqslant P$.

Since $\widehat{\alpha}^+ \{ \Theta_0 \} \in \Xi$ and $\Theta_0 \vdash Q'$, it is clear that $\Xi \vdash (\widehat{\alpha}^+ : \geqslant Q') : \widehat{\alpha}^+$.

It is left to show that $\Theta \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant P'$ for any normalized $\widehat{\sigma}$ s.t. $\Xi \vdash \widehat{\sigma} : (\widehat{\alpha}^+ : \geqslant Q')$. The latter means that $\Xi(\widehat{\alpha}^+) \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant Q'$, i.e. $\Theta_0 \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant Q'$. By weakening the context to Θ and combining this judgment transitively with $\Theta \vdash Q' \geqslant P$, we have $\Theta \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant P$, as required.

- **Case 2.** (VAR_+^{\geqslant}) then Θ ; $\Xi \models P \geqslant Q \dashv C$ has shape Θ ; $\Xi \models \alpha^+ \geqslant \alpha^+ \dashv \cdot$. Then $fav(\alpha^+) = \emptyset$, and $C = \cdot$ satisfies $\Xi \vdash C : \cdot$. Since $fav(\alpha^+) = \emptyset$, application of any substitution $\widehat{\sigma}$ does not change α^+ , i.e. $[\widehat{\sigma}]\alpha^+ = \alpha^+$. Therefore, $\Theta \vdash [\widehat{\sigma}]\alpha^+ \geqslant \alpha^+$ holds by (VAR_-^{\leq}) .
- Case 3. (\downarrow) then Θ ; $\Xi \models P \geqslant Q \dashv C$ has shape Θ ; $\Xi \models \downarrow N \geqslant \downarrow M \dashv C$. Then the next step of the algorithm is the unification of nf(N) and nf(M), and it returns the resulting unification constraint UC = C as the result. By the soundness of unification (Lemma 72), $\Xi \models C : fav(N)$ and for any normalized $\widehat{\sigma}$, $\Xi \models \widehat{\sigma} : C$ implies $[\widehat{\sigma}] nf(N) = nf(M)$, then we rewrite the left-hand side by Lemma 43: $nf([\widehat{\sigma}]N) = nf(M)$ and apply

Lemma 48: $\Theta \vdash [\widehat{\sigma}] N \cong^{\leq} M$, then by $(\uparrow^{\leq}), \Theta \vdash \downarrow [\widehat{\sigma}] N \geqslant \downarrow M$.

Case 4. (\exists^{\geq}) then Θ ; $\Xi \models P \geq Q \exists C$ has shape Θ ; $\Xi \models \exists \overrightarrow{\alpha} : P' \geq \exists \overrightarrow{\beta} : Q' \exists C$ s.t. either $\overrightarrow{\alpha}$ or $\overrightarrow{\beta}$ is not empty.

Then the algorithm creates fresh unification variables $\overrightarrow{\alpha} \{\Theta, \overrightarrow{\beta^-}\}$, substitutes the old $\overrightarrow{\alpha}$ with them in \overrightarrow{P}' , and makes the recursive call: $\Theta, \overrightarrow{\beta^-}; \Xi, \overrightarrow{\alpha} \{\Theta, \overrightarrow{\beta^-}\} \models [\overrightarrow{\alpha}'/\overrightarrow{\alpha}'] \overrightarrow{P}' \geqslant Q' \dashv C'$, returning as the result $C = C' \setminus \overrightarrow{\alpha}^-$.

Let us take an arbitrary normalized $\widehat{\sigma}$ s.t. $\Xi \vdash \widehat{\sigma} : C' \setminus \overrightarrow{\widehat{\alpha}}$. We wish to show $\Theta \vdash [\widehat{\sigma}] P \geqslant Q$, i.e. $\Theta \vdash \exists \overrightarrow{\alpha}$. $[\widehat{\sigma}] P' \geqslant \exists \overrightarrow{\beta}$. Q'. To do that, we apply (\exists^{\geqslant}) , and what is left to show is $\Theta, \overrightarrow{\beta} \vdash [\overrightarrow{N}/\overrightarrow{\alpha}] [\widehat{\sigma}] P' \geqslant Q'$ for some \overrightarrow{N} . If we construct a normalized $\widehat{\sigma}'$ such that $\Xi, \overrightarrow{\alpha} = \{\Theta, \overrightarrow{\beta}^{\Rightarrow}\} \vdash \widehat{\sigma}' : C'$ and for some $\overrightarrow{N}, [\overrightarrow{N}/\overrightarrow{\alpha}] [\widehat{\sigma}] P' = [\widehat{\sigma}'] [\overrightarrow{\alpha}/\overrightarrow{\alpha}] P'$, we can apply the

induction hypothesis to $\Theta, \overrightarrow{\beta^-}; \Xi, \overrightarrow{\widehat{\alpha}^-} \{\Theta, \overrightarrow{\beta^-}\} \models [\overrightarrow{\widehat{\alpha}^-}/\overrightarrow{\alpha^-}] P \geqslant Q = C'$ and infer the required subtyping.

Let us construct such $\widehat{\sigma}'$ by extending $\widehat{\sigma}$ with $\overrightarrow{\widehat{\alpha}}'$ mapped to the corresponding types in C':

$$[\widehat{\sigma}'] \widehat{\beta}^{\pm} = \begin{cases} [\widehat{\sigma}] \widehat{\beta}^{\pm} & \text{if } \widehat{\beta}^{\pm} \in \text{dom} (C') \setminus \overrightarrow{\widehat{\alpha}^{-}} \\ \text{nf} (N) & \text{if } \widehat{\beta}^{\pm} \in \overrightarrow{\widehat{\alpha}^{-}} \text{ and } (\widehat{\beta}^{\pm} : \simeq N) \in SC' \end{cases}$$

It is easy to see that $\widehat{\sigma}'$ is normalized: it inherits this property from $\widehat{\sigma}$. Let us show that $\Xi, \overrightarrow{\widehat{\alpha}}^{+}\{\Theta, \overrightarrow{\beta^{-}}\} \vdash \widehat{\sigma}' : C'$. Let us take an arbitrary entry e from C' restricting a variable $\widehat{\beta^{\pm}}$. Suppose $\widehat{\beta^{\pm}} \in \text{dom}(C') \setminus \overrightarrow{\widehat{\alpha}}$. Then $(\Xi, \overrightarrow{\widehat{\alpha}^{-}}\{\Theta, \overrightarrow{\beta^{-}}\})(\widehat{\beta^{\pm}}) \vdash [\widehat{\sigma}']\widehat{\beta^{\pm}} : e$ is rewritten as $\Xi(\widehat{\beta^{\pm}}) \vdash [\widehat{\sigma}]\widehat{\beta^{\pm}} : e$, which holds since $\Xi \vdash \widehat{\sigma} : C'$. Suppose $\widehat{\beta^{\pm}} = \widehat{\alpha_i}^- \in \overrightarrow{\widehat{\alpha}}^-$. Then $e = (\widehat{\alpha_i}^- := N)$ for some N, $[\widehat{\sigma}']\widehat{\alpha_i}^- = \text{nf}(N)$ by the definition, and $\Theta, \overrightarrow{\beta^{-}} \vdash \text{nf}(N) : (\widehat{\alpha_i}^- := N)$ by $(:\cong_{-}^{\text{SAT}})$, since $\Theta \vdash \text{nf}(N) \cong^{\leq} N$ by Lemma 48.

Finally, let us show that $[\overrightarrow{N}/\overrightarrow{\alpha}][\widehat{\sigma}] \underline{P}' = [\widehat{\sigma}'][\overrightarrow{\alpha}'/\overrightarrow{\alpha}] \underline{P}'$. For N_i , we take the *normalized* type restricting $\widehat{\alpha}_i^-$ in C'. Let us take an arbitrary variable from \underline{P} .

- (1) If this variable is a unification variable $\widehat{\beta}^{\pm}$, then $[\overrightarrow{N}/\overrightarrow{\alpha}^{-}][\widehat{\sigma}]\widehat{\beta}^{\pm} = [\widehat{\sigma}]\widehat{\beta}^{\pm}$, since $\Xi \vdash \widehat{\sigma} : C' \setminus \overrightarrow{\widehat{\alpha}^{-}}$ and dom $(\Xi) \cap \overrightarrow{\alpha^{-}} = \emptyset$.
 - Notice that $\widehat{\beta}^{\pm} \in \text{dom}(\Xi)$, which is disjoint from $\overrightarrow{\widehat{\alpha}}$, that is $\widehat{\beta}^{\pm} \in \text{dom}(C') \setminus \overrightarrow{\widehat{\alpha}}$. This way, $[\widehat{\sigma}'][\overrightarrow{\widehat{\alpha}}'/\alpha^{-2}]\widehat{\beta}^{\pm} = [\widehat{\sigma}']\widehat{\beta}^{\pm} = [\widehat{\sigma}]\widehat{\beta}^{\pm}$ by the definition of $\widehat{\sigma}'$,
- (2) If this variable is a regular variable $\beta^{\pm} \notin \overrightarrow{\alpha}^{-}$, then $[\overrightarrow{N}/\overrightarrow{\alpha}^{-}][\widehat{\sigma}]\beta^{\pm} = \beta^{\pm}$ and $[\widehat{\sigma}'][\overrightarrow{\alpha}^{-}/\overrightarrow{\alpha}^{-}]\beta^{\pm} = \beta^{\pm}$.
- (3) If this variable is a regular variable $\alpha_i^- \in \overrightarrow{\alpha}$, then $[\overrightarrow{N}/\overrightarrow{\alpha}][\widehat{\sigma}]\alpha_i^- = N_i = \inf(N_i)$ (the latter equality holds since N_i is normalized) and $[\widehat{\sigma}'][\overrightarrow{\alpha}]\alpha_i^- = [\widehat{\sigma}']\widehat{\alpha}_i^- = \inf(N_i)$.

Lemma 87 (Completeness of the Positive Subtyping). Suppose that $\Theta \vdash^{\supseteq} \Xi, \Theta \vdash Q$ and Θ ; dom $(\Xi) \vdash P$. Then for any $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(P)$ such that $\Theta \vdash [\widehat{\sigma}]P \geqslant Q$, there exists Θ ; $\Xi \vdash P \geqslant Q \dashv C$ and moreover, $\Xi \vdash \widehat{\sigma} : C$.

Proof. Let us prove this lemma by induction on $\Theta \vdash [\widehat{\sigma}] P \geqslant Q$. Let us consider the last rule used in the derivation, but first, consider the base case for the substitution $[\widehat{\sigma}] P$:

Case 1. $P = \exists \overrightarrow{\beta}^{-}. \widehat{\alpha}^{+}$ (for potentially empty $\overrightarrow{\beta}^{-}$)
Then by assumption, $\Theta \vdash \exists \overrightarrow{\beta}^{-}. [\widehat{\sigma}] \widehat{\alpha}^{+} \geqslant Q$ (where $\overrightarrow{\beta}^{-} \cap \text{fv} [\widehat{\sigma}] \widehat{\alpha}^{+} = \emptyset$). Let us decompose Q as $Q = \exists \overrightarrow{\gamma}^{-}. Q_{0}$, where Q_{0} does not start with \exists .

By inversion, Θ ; dom $(\Xi) \vdash \exists \overrightarrow{\beta}^-$. $\widehat{\alpha}^+$ implies $\widehat{\alpha}^+ \{\Theta_0\} \in \Xi$ for some $\Theta_0 \subseteq \Theta$.

By Lemma 18 applied twice, $\Theta \vdash \exists \overrightarrow{\beta^-}. [\widehat{\sigma}] \widehat{\alpha}^+ \geqslant \exists \overrightarrow{\gamma^-}. Q_0 \text{ implies } \Theta, \overrightarrow{\gamma^-} \vdash [\overrightarrow{N}/\overrightarrow{\beta^-}] [\widehat{\sigma}] \widehat{\alpha}^+ \geqslant Q_0$ for some N, and since $\overrightarrow{\beta^-} \cap \text{fv}([\widehat{\sigma}] \widehat{\alpha}^+) \subseteq \overrightarrow{\beta^-} \cap \Xi(\widehat{\alpha}^+) \subseteq \overrightarrow{\beta^-} \cap \Theta = \cdot, [\overrightarrow{N}/\overrightarrow{\beta^-}] [\widehat{\sigma}] \widehat{\alpha}^+ = [\widehat{\sigma}] \widehat{\alpha}^+,$ that is $\Theta, \overrightarrow{\gamma^-} \vdash [\widehat{\sigma}] \widehat{\alpha}^+ \geqslant Q_0$.

When algorithm tires to infer the subtyping Θ ; $\Xi \models \exists \overrightarrow{\beta^-}. \widehat{\alpha}^+ \geqslant \exists \overrightarrow{\gamma^-}. Q_0 = C$, it applies (\exists^{\geqslant}) , which reduces the problem to $\Theta, \overrightarrow{\gamma^-}; \Xi, \widehat{\beta}^- \{\Theta, \overrightarrow{\gamma^-}\} \models [\widehat{\beta}^-/\widehat{\beta}^-]\widehat{\alpha}^+ \geqslant Q_0 = C$, which is equivalent to $\Theta, \overrightarrow{\gamma^-}; \Xi, \widehat{\beta}^- \{\Theta, \overrightarrow{\gamma^-}\} \models \widehat{\alpha}^+ \geqslant Q_0 = C$.

Next, the algorithm tries to apply (UVAR $^>$) and the resulting restriction is $C = (\widehat{\alpha}^+ : \ge Q_0')$ where upgrade Θ , $\overrightarrow{\gamma}^- \vdash Q_0$ to $\Theta_0 = Q_0'$.

Why does the upgrade procedure terminate? Because $[\widehat{\sigma}]\widehat{\alpha}^+$ satisfies the pre-conditions of the completeness of the upgrade (Lemma 83):

- (1) $\Theta_0 \vdash [\widehat{\sigma}] \widehat{\alpha}^+$ because $\Xi \vdash \widehat{\sigma} : \widehat{\alpha}^+$ and $\widehat{\alpha}^+ \{\Theta_0\} \in \Xi$,
- (2) $\Theta, \overrightarrow{\gamma}^{-} \vdash [\widehat{\sigma}]\widehat{\alpha}^{+} \geqslant Q_{0}$ as noted above

 Moreover, the completeness of upgrade also says that Q_0' is *the least* supertype of Q_0 among types well-formed in Θ_0 , that is $\Theta_0 \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant Q_0'$, which means $\Xi \vdash \widehat{\sigma} : (\widehat{\alpha}^+ : \geqslant Q_0')$, that is $\Xi \vdash \widehat{\sigma} : C$.

Case 2. $\Theta \vdash [\widehat{\sigma}] P \geqslant Q$ is derived by (VAR_+^{\geqslant})

Then $P = [\widehat{\sigma}]P = \alpha^+ = Q$, where the first equality holds because P is not a unification variable: it has been covered by case 1; and the second equality hold because (VAR_+^{\geqslant}) was applied.

The algorithm applies (VAR_+^{\geqslant}) and infers $C = \cdot$, i.e. Θ ; $\Xi \models \alpha^+ \geqslant \alpha^+ \dashv \cdot$. Then $\Xi \vdash \widehat{\sigma} : \cdot$ holds trivially.

Case 3. $\Theta \vdash [\widehat{\sigma}] P \geqslant Q$ is derived by (\downarrow^{\geqslant}) ,

Then $P = \bigcup N$, since the substitution $[\widehat{\sigma}]P$ must preserve the top-level constructor of $P \neq \widehat{\alpha}^+$ (the case $P = \widehat{\alpha}^+$ has been covered by case 1), and $Q = \bigcup M$, and by inversion, $\Theta \vdash [\widehat{\sigma}]N \simeq^{\leq} M$.

Since both types start with \downarrow , the algorithm tries to apply (\downarrow^{\geqslant}) : Θ ; $\Xi \models \downarrow N \geqslant \downarrow M \exists C$. The premise of this rule is the unification of (N) and (M): Θ ; $\Xi \models (N) \stackrel{u}{\simeq} (M) \exists UC$. And the algorithm returns it as a subtyping constraint C = UC.

To demonstrate that the unification terminates ant $\widehat{\sigma}$ satisfies the resulting constraints, we apply the completeness of the unification algorithm (Lemma 73). In order to do that, we need to provide a substitution unifying nf (N) and nf (M). Let us show that nf $(\widehat{\sigma})$ is such a substitution.

- nf (N) and nf (M) are normalized
- Θ ; dom $(\Xi) \vdash \mathsf{nf}(N)$ because Θ ; dom $(\Xi) \vdash N$ (Corollary 24)

• $\Theta \vdash \mathsf{nf}(M)$ because $\Theta \vdash M$ (Corollary 14)

 • $\Xi \vdash \mathsf{nf}(\widehat{\sigma}) : \mathsf{fav}(\underline{P}) \text{ because } \Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{P}) \text{ (Corollary 25)}$

 $\Theta \vdash [\widehat{\sigma}] N \simeq^{\leqslant} M \Rightarrow [\widehat{\sigma}] N \simeq^{D} M$ by Lemma 34 $\Rightarrow \operatorname{nf}([\widehat{\sigma}] N) = \operatorname{nf}(M)$ by Lemma 44 $\Rightarrow [\operatorname{nf}(\widehat{\sigma})] \operatorname{nf}(N) = \operatorname{nf}(M)$ by Lemma 43

By the completeness of the unification, Θ ; $\Xi \models \mathbb{N} \stackrel{u}{\simeq} M \dashv UC$ exists, and $\Xi \vdash \mathsf{nf}(\widehat{\sigma}) : UC$, and by Corollary 28, $\Xi \vdash \widehat{\sigma} : UC$.

Case 4. $\Theta \vdash [\widehat{\sigma}] P \geqslant Q$ is derived by (\exists^{\geqslant}) .

We should only consider the case when the substitution $[\widehat{\sigma}]P$ results in the existential type $\exists \overrightarrow{\alpha} \cdot P''$ (for $P'' \neq \exists ...$) by congruence, i.e. $P = \exists \overrightarrow{\alpha} \cdot P'$ (for $P' \neq \exists ...$) and $[\widehat{\sigma}]P' = P''$. This is because the case when $P = \exists \overrightarrow{\beta} \cdot \widehat{\alpha}^+$ has been covered (case 1), and thus, the substitution $\widehat{\sigma}$ must preserve all the outer quantifiers of P and does not generate any new ones.

This way, $P = \exists \overrightarrow{\alpha}$. P', $[\widehat{\sigma}]P = \exists \overrightarrow{\alpha}$. $[\widehat{\sigma}]P'$ (assuming $\overrightarrow{\alpha}$ does not intersect with the range of $\widehat{\sigma}$) and $Q = \exists \overrightarrow{\beta}$. Q', where either $\overrightarrow{\alpha}$ or $\overrightarrow{\beta}$ is not empty.

By inversion, $\Theta \vdash [\sigma][\widehat{\sigma}]P' \geqslant Q'$ for some $\Theta, \overrightarrow{\beta^+} \vdash \sigma : \overrightarrow{\alpha^+}$. Since σ and $\widehat{\sigma}$ have disjoint domains, and the range of one does not intersect with the domain of the other, they commute, i.e. $\Theta, \overrightarrow{\beta^+} \vdash [\widehat{\sigma}][\sigma]P' \geqslant Q'$ (notice that the tree inferring this judgement is a proper subtree of the tree inferring $\Theta \vdash [\widehat{\sigma}]P \geqslant Q$).

At the next step, the algorithm creates fresh (disjoint with $fav(\underline{P'})$) unification variables $\overrightarrow{\alpha}$, replaces $\overrightarrow{\alpha}$ with them in $\underline{P'}$, and makes the recursive call: Θ , $\overrightarrow{\beta}$; Ξ , $\overrightarrow{\alpha}$ $\{\Theta$, $\overrightarrow{\beta}$ $\}$ $\models \underline{P_0} \geqslant \underline{Q'} \Rightarrow C_1$, (where $\underline{P_0} = [\overrightarrow{\alpha}/\alpha^2]\underline{P'}$), returning $C_1 \setminus \overrightarrow{\alpha}$ as the result.

To show that the recursive call terminates and that $\Xi \vdash \widehat{\sigma} : C_1 \setminus \overrightarrow{\widehat{\alpha}}$, it suffices to build $\Xi, \overrightarrow{\widehat{\alpha}} \vdash \{\Theta, \overrightarrow{\beta}^-\} \vdash \widehat{\sigma_0} : \mathsf{fav}(\underline{P_0})$ —an extension of $\widehat{\sigma}$ with $\widehat{\alpha}^- \cap \mathsf{fav}(\underline{P_0})$ such that $\Theta, \overrightarrow{\beta}^- \vdash [\widehat{\sigma_0}] \underline{P_0} \geqslant \underline{Q}$. Then by the induction hypothesis, $\Xi, \widehat{\alpha}^- \vdash \{\Theta, \overrightarrow{\beta}^-\} \vdash \widehat{\sigma_0} : C_1$, and hence, $\Xi \vdash \widehat{\sigma} : C_1 \setminus \widehat{\alpha}^-$, as required.

Let us construct such a substitution $\widehat{\sigma}_0$:

$$[\widehat{\sigma}_0]\widehat{\beta}^{\pm} = \begin{cases} [\sigma]\alpha_i^- & \text{if } \widehat{\beta}^{\pm} = \widehat{\alpha}_i^- \in \overrightarrow{\widehat{\alpha}}^- \cap \mathsf{fav}(\underline{P}_0) \\ [\widehat{\sigma}]\widehat{\beta}^{\pm} & \text{if } \widehat{\beta}^{\pm} \in \mathsf{fav}(\underline{P}') \end{cases}$$

It is easy to see $\Xi, \overrightarrow{\alpha}^- \{\Theta, \overrightarrow{\beta}^-\} \vdash \widehat{\sigma}_0 : \mathsf{fav}(\underline{P}_0) : \mathsf{fav}(\underline{P}_0) = \mathsf{fav}([\overrightarrow{\alpha}^-/\overrightarrow{\alpha}^-]\underline{P}') = \overrightarrow{\alpha}^- \cap \mathsf{fav}(\underline{P}_0) \cup \mathsf{fav}(\underline{P}')$. Then

(1) for $\widehat{\alpha_i}^- \in \overrightarrow{\widehat{\alpha}}^- \cap \mathsf{fav}(\underline{P}_0)$, $(\Xi, \overrightarrow{\widehat{\alpha}}^- \{\Theta, \overrightarrow{\beta}^-\})(\widehat{\alpha_i}^-) \vdash [\widehat{\sigma_0}]\widehat{\alpha_i}^-$, i.e. $\Theta, \overrightarrow{\beta}^- \vdash [\sigma]\alpha_i^-$ holds since $\Theta, \overrightarrow{\beta}^- \vdash \sigma : \overrightarrow{\alpha}^-$,

(2) for $\widehat{\beta}^{\pm} \in \text{fav}(\underline{P}') \subseteq \text{dom}(\Xi)$, $(\Xi, \widehat{\alpha}^{\pm} \{\Theta, \overline{\beta}^{\pm}\})(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_0] \widehat{\beta}^{\pm}$, i.e. $\Xi(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}] \widehat{\beta}^{\pm}$ holds since $\Xi \vdash \widehat{\sigma} : \text{fav}(\underline{P})$ and $\widehat{\beta}^{\pm} \in \text{fav}(\underline{P}') = \text{fav}(\underline{P})$.

Now, let us show that $\Theta, \overrightarrow{\beta^-} \vdash [\widehat{\sigma_0}] P_0 \geqslant Q$. To do that, we notice that $[\widehat{\sigma_0}] P_0 = [\widehat{\sigma}] [\sigma] [\overrightarrow{\alpha^-}/\overrightarrow{\alpha^-}] P_0$: let us consider an arbitrary variable appearing freely in P_0 :

- (1) if this variable is a algorithmic variable $\widehat{\alpha}_i^- \in \overrightarrow{\widehat{\alpha}}^-$, then $[\widehat{\sigma}_0]\widehat{\alpha}_i^- = [\sigma]\alpha_i^-$ and $[\widehat{\sigma}][\sigma][\overrightarrow{\alpha}^-/\overrightarrow{\widehat{\alpha}}^-]\widehat{\alpha}_i^- = [\widehat{\sigma}][\sigma]\alpha_i^- = [\sigma]\alpha_i^-$,
- (2) if this variable is a algorithmic variable $\widehat{\beta}^{\pm} \in \mathsf{fav}(\underline{P}_0) \setminus \overrightarrow{\widehat{\alpha}}^{-} = \mathsf{fav}(\underline{P}')$, then $[\widehat{\sigma}_0]\widehat{\beta}^{\pm} = [\widehat{\sigma}]\widehat{\beta}^{\pm}$ and $[\widehat{\sigma}][\widehat{\sigma}][\overrightarrow{\alpha}^{-}/\widehat{\alpha}^{-}]\widehat{\beta}^{\pm} = [\widehat{\sigma}][\widehat{\sigma}]\widehat{\beta}^{\pm} = [\widehat{\sigma}][\widehat{\beta}^{\pm},$
- (3) if this variable is a regular variable from $fv(P_0)$, both substitutions do not change it: $\widehat{\sigma}_0$, $\widehat{\sigma}$ and $\overrightarrow{\alpha}/\overrightarrow{\alpha}$ act on algorithmic variables, and σ is defined on $\overrightarrow{\alpha}$, however, $\overrightarrow{\alpha} \cap fv(P_0) = \emptyset$.

This way, $[\widehat{\sigma}_0] P_0 = [\widehat{\sigma}] [\overrightarrow{\alpha}' / \overrightarrow{\widehat{\alpha}'}] P_0 = [\widehat{\sigma}] [\sigma] P'$, and thus, $\Theta, \overrightarrow{\beta}' \vdash [\widehat{\sigma}_0] P_0 \geqslant Q'$.

3.3.12 Subtyping Constraint Merge.

 Observation 14 (Constraint Entry Merge is Deterministic). For fixed Θ , e_1 , e_2 , if $\Theta \vdash e_1 \& e_2 = e$ and $\Theta \vdash e_1 \& e_2 = e'$ then e = e'.

Proof. First, notice that the shape of e_1 and e_2 uniquely determines the rule applied to infer $\Theta \vdash e_1 \& e_2 = e$, which is consequently, the same rule used to infer $\Theta \vdash e_1 \& e_2 = e'$. Second, notice that the premises of each rule are deterministic on the input: the positive subtyping is deterministic by Observation 13, and the least upper bound is deterministic by Observation 10.

Observation 15 (Subtyping Constraint Merge is Deterministic). Suppose that $\Xi \vdash C_1$ and $\Xi \vdash C_2$ If $\Xi \vdash C_1 \& C_2 = C$ and $\Xi \vdash C_1 \& C_2 = C'$ are defined then C = C'.

Proof. The proof is analogous to the proof of Observation 6 but uses Observation 14 to show that the merge of the matching constraint entries is fixed.

Lemma 88 (*Soundness of Constraint Entry Merge*). For a fixed context Θ , suppose that $\Theta \vdash e_1$ and $\Theta \vdash e_2$. If $\Theta \vdash e_1 \& e_2 = e$ is defined then

- (1) $\Theta \vdash e$
- (2) For any $\Theta \vdash P$, $\Theta \vdash P : e$ implies $\Theta \vdash P : e_1$ and $\Theta \vdash P : e_2$

Proof. Let us consider the rule forming $\Theta \vdash e_1 \& e_2 = e$.

Case 1. $(\simeq \&^+ \simeq)$, i.e. $\Theta \vdash e_1 \& e_2 = e$ has form $\Theta \vdash (\widehat{\alpha}^+ :\simeq Q) \& (\widehat{\alpha}^+ :\simeq Q') = (\widehat{\alpha}^+ :\simeq Q)$ and $(Q) = \inf(Q')$. The latter implies $\Theta \vdash Q \simeq^{\leq} Q'$ by Lemma 48. Then

(1) $\Theta \vdash e$, i.e. $\Theta \vdash \widehat{\alpha}^+ :\simeq O$ holds by assumption;

, Vol. 1, No. 1, Article . Publication date: July 2024.

(2) by inversion, $\Theta \vdash P : (\widehat{\alpha}^+ :\simeq Q)$ means $\Theta \vdash P \simeq^{\leqslant} Q$, and by transitivity of equivalence (Corollary 10), $\Theta \vdash P \simeq^{\leqslant} Q'$. Thus, $\Theta \vdash P : e_1$ and $\Theta \vdash P : e_2$ hold by $(:\simeq^{SAT}_+)$.

Case 2. ($\simeq \&^- \simeq$) the negative case is proved in exactly the same way as the positive one.

Case 3. ($\geqslant \&^+ \geqslant$) Then e_1 is $\widehat{\alpha}^+ : \geqslant Q_1$, e_2 is $\widehat{\alpha}^+ : \geqslant Q_2$, and $e_1 \& e_2 = e$ is $\widehat{\alpha}^+ : \geqslant Q$ where Q is the least upper bound of Q_1 and Q_2 . Then by Lemma 80,

• $\Theta \vdash Q$,

6611

6612

6613

6614

- $\Theta \vdash Q \geqslant Q_1$,
- $\Theta \vdash O \geqslant O_2$.

Let us show the required properties.

- $\Theta \vdash e \text{ holds from } \Theta \vdash Q$,
- Assuming $\Theta \vdash P : e$, by inversion, we have $\Theta \vdash P \geqslant Q$. Combining it transitively with $\Theta \vdash Q \geqslant Q_1$, we have $\Theta \vdash P \geqslant Q_1$. Analogously, $\Theta \vdash P \geqslant Q_2$. Then $\Theta \vdash P : e_1$ and $\Theta \vdash P : e_2$ hold by $(:\geqslant_+^{SAT})$.

Case 4. ($\geqslant \&^+ \simeq$) Then e_1 is $\widehat{\alpha}^+ : \geqslant Q_1$, e_2 is $\widehat{\alpha}^+ : \simeq Q_2$, where Θ ; $\cdot \models Q_2 \geqslant Q_1 \dashv \cdot$, and the resulting $e_1 \& e_2 = e$ is equal to e_2 , that is $\widehat{\alpha}^+ : \simeq Q_2$.

Let us show the required properties.

- By assumption, $\Theta \vdash Q$, and hence $\Theta \vdash e$.
- Since fav(Q_2) = \emptyset , Θ ; $\cdot \models Q_2 \geqslant Q_1 \dashv \cdot \text{implies } \Theta \vdash Q_2 \geqslant Q_1$ by the soundness of positive subtyping (Lemma 86). Then let us take an arbitrary $\Theta \vdash P$ such that $\Theta \vdash P : e$. Since $e_2 = e$, $\Theta \vdash P : e_2$ holds immediately.

By inversion, $\Theta \vdash P : (\widehat{\alpha}^+ :\simeq Q_2)$ means $\Theta \vdash P \simeq^{\leqslant} Q_2$, and then by transitivity of subtyping (Lemma 24), $\Theta \vdash P \geqslant Q_1$. Then $\Theta \vdash P : e_1$ holds by $(:\geqslant_+^{SAT})$.

Case 5. ($\simeq \&^+ \geqslant$) Thee proof is analogous to the previous case.

Lemma 89 (Soundness of Constraint Merge). Suppose that $\Xi \vdash C_1 : \widehat{\Theta}_1$ and $\Xi \vdash C_2 : \widehat{\Theta}_2$ and $\Xi \vdash C_1 \& C_2 = C$ is defined. Then

- (1) $\Xi \vdash C : \widehat{\Theta}_1 \cup \widehat{\Theta}_2$,
- (2) for any substitution $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}_1 \cup \widehat{\Theta}_2, \Xi \vdash \widehat{\sigma} : C$ implies $\Xi \vdash \widehat{\sigma} : C_1$ and $\Xi \vdash \widehat{\sigma} : C_2$.

Proof. By definition, $\Xi \vdash C_1 \& C_2 = C$ consists of three parts: entries of C_1 that do not have matching entries of C_2 , entries of C_2 that do not have matching entries of C_1 , and the merge of matching entries.

Notice that $\widehat{\alpha}^{\pm} \in \widehat{\Theta}_1 \setminus \widehat{\Theta}_2$ if and only if there is an entry e in C_1 restricting $\widehat{\alpha}^{\pm}$, but there is no such entry in C_2 . Therefore, for any $\widehat{\alpha}^{\pm} \in \widehat{\Theta}_1 \setminus \widehat{\Theta}_2$, there is an entry e in C restricting $\widehat{\alpha}^{\pm}$. Notice that $\Xi(\widehat{\alpha}^{\pm}) \vdash e$ holds since $\Xi \vdash C_1 : \widehat{\Theta}_1$.

Analogously, for any $\widehat{\beta}^{\pm} \in \widehat{\Theta}_2 \setminus \widehat{\Theta}_1$, there is an entry e in C restricting $\widehat{\beta}^{\pm}$. Notice that $\Xi(\widehat{\beta}^{\pm}) \vdash e$ holds since $\Xi \vdash C_2 : \widehat{\Theta}_2$.

Finally, for any $\widehat{\gamma}^{\pm} \in \widehat{\Theta}_1 \cap \widehat{\Theta}_2$, there is an entry e_1 in C_1 restricting $\widehat{\gamma}^{\pm}$ and an entry e_2 in C_2 restricting $\widehat{\gamma}^{\pm}$. Since $\Xi \vdash C_1 \& C_2 = C$ is defined, $\Xi(\widehat{\gamma}^{\pm}) \vdash e_1 \& e_2 = e$ restricting $\widehat{\gamma}^{\pm}$ is defined and belongs to C, moreover, $\Xi(\widehat{\gamma}^{\pm}) \vdash e$ by Lemma 88. This way, $\Xi \vdash C : \widehat{\Theta}_1 \cup \widehat{\Theta}_2$.

Let us show the second property. We take an arbitrary $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}_1 \cup \widehat{\Theta}_2$ and $\Xi \vdash \widehat{\sigma} : C$. To prove $\Xi \vdash \widehat{\sigma} : C_1$, we need to show that for any $e_1 \in C_1$, restricting $\widehat{\alpha}^{\pm}$, $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm} : e_1$ holds.

Let us assume that $\widehat{\alpha}^{\pm} \notin \text{dom}(C_2)$. It means that $C \ni e_1$, and then since $\Xi \vdash \widehat{\sigma} : C, \Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : e_1$.

Otherwise, C_2 contains an entry e_2 restricting $\widehat{\alpha}^{\pm}$, and $C \ni e$ where $\Xi(\widehat{\alpha}^{\pm}) \vdash e_1 \& e_2 = e$. Then since $\Xi \vdash \widehat{\sigma} : C, \Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm} : e$, and by Lemma 88, $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm} : e_1$.

The proof of $\Xi \vdash \widehat{\sigma} : C_2$ is symmetric.

Lemma 90 (Completeness of Constraint Entry Merge). For a fixed context Θ , suppose that $\Theta \vdash e_1$ and $\Theta \vdash e_2$ are matching constraint entries.

- for a type P such that $\Theta \vdash P : e_1$ and $\Theta \vdash P : e_2$, $\Theta \vdash e_1 \& e_2 = e$ is defined and $\Theta \vdash P : e$.
- for a type N such that $\Theta \vdash N : e_1$ and $\Theta \vdash N : e_2$, $\Theta \vdash e_1 \& e_2 = e$ is defined and $\Theta \vdash N : e$.

Proof. Let us consider the shape of e_1 and e_2 .

Case 1. e_1 is $\widehat{\alpha}^+$: $\simeq Q_1$ and e_2 is $\widehat{\alpha}^+$: $\simeq Q_2$. The proof repeats the corresponding case of Lemma 70

Case 2. e_1 is $\widehat{\alpha}^+ :\simeq Q_1$ and e_2 is $\widehat{\alpha}^+ :\geqslant Q_2$. Then $\Theta \vdash P : e_1$ means $\Theta \vdash P \simeq^e Q_1$, and $\Theta \vdash P : e_2$ means $\Theta \vdash P \geqslant Q_2$. Then by transitivity of subtyping, $\Theta \vdash Q_1 \geqslant Q_2$, which means $\Theta : \vdash Q_1 \geqslant Q_2 = \cdot$ by Lemma 87. This way, $(\simeq \&^+ \geqslant)$ applies to infer $\Theta \vdash e_1 \& e_2 = e_1$, and $\Theta \vdash P : e_1$ holds by assumption.

Case 3. e_1 is $\widehat{\alpha}^+ : \geqslant Q_1$ and e_2 is $\widehat{\alpha}^+ : \geqslant Q_2$. Then $\Theta \vdash P : e_1$ means $\Theta \vdash P \geqslant Q_1$, and $\Theta \vdash P : e_2$ means $\Theta \vdash P \geqslant Q_2$. By the completeness of the least upper bound (Lemma 81), $\Theta \models Q_1 \lor Q_2 = Q$, and $\Theta \vdash P \geqslant Q$. This way, $(\geqslant \&^+ \geqslant)$ applies to infer $\Theta \vdash e_1 \& e_2 = (\widehat{\alpha}^+ : \geqslant Q)$, and $\Theta \vdash P : (\widehat{\alpha}^+ : \geqslant Q)$ holds by $(:\geqslant_+^{SAT})$.

Case 4. The negative cases are proved symmetrically.

Lemma 91 (Completeness of Constraint Merge). Suppose that $\Xi \vdash C_1 : \widehat{\Theta}_1$ and $\Xi \vdash C_2 : \widehat{\Theta}_2$. If there exists a substitution $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}_1 \cup \widehat{\Theta}_2$ such that $\Xi \vdash \widehat{\sigma} : C_1$ and $\Xi \vdash \widehat{\sigma} : C_2$ then $\Xi \vdash C_1 \& C_2 = C$ is defined.

Proof. By definition, $C_1 \& C_2$ is a union of

6665 6666 6667

(1) entries of C_1 , which do not have matching entries in C_2 ,

6668

(2) entries of C_2 , which do not have matching entries in C_1 , and

6670

(3) the merge of matching entries.

3.3.13 Negative Subtyping.

hypothesis;

6672 6673

This way, to show that $\Xi \vdash C_1 \& C_2 = C$ is defined, we need to demonstrate that each of these components is defined and satisfies the required property (that the result of $\widehat{\sigma}$ satisfies the corresponding constraint entry).

6675 6676 6677

6674

It is clear that the first two components of this union exist. Moreover, if e is an entry of C_i restricting $\widehat{\alpha}^{\pm} \notin \text{dom}(C_2)$, then $\Xi \vdash \widehat{\sigma} : C_i$ implies $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : e$,

6678 6680

Let us show that the third component exists. Let us take two entries $e_1 \in C_1$ and $e_2 \in C_2$ restricting the same variable $\widehat{\alpha}^{\pm}$. $\Xi \vdash \widehat{\sigma} : C_1$ means that $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}] \widehat{\alpha}^{\pm} : e_1$ and $\Xi \vdash \widehat{\sigma} : C_2$ means $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : e_2$. Then by Lemma 90, $\Xi(\widehat{\alpha}^{\pm}) \vdash e_1 \& e_2 = e$ is defined and $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\alpha}^{\pm} : e$.

Observation 16 (Negative Algorithmic Subtyping is Deterministic). For fixed Θ , Ξ , M, and N, if

Proof. First, notice that the shape of the input uniquely determines the rule applied to infer

Second, notice that for each of the inference rules, the premises are deterministic on the input.

 (∀[≤]) relies on the choice of fresh algorithmic variables, which is deterministic as discussed in Section 1.2.2, and on the negative subtyping, which is deterministic by the induction

• (\rightarrow^{\leq}) uses the negative subtyping (deterministic by the induction hypothesis), the positive

subtyping (Observation 13), and the merge of subtyping constraints (Observation 15);

Lemma 92 (Soundness of Negative Subtyping). If $\Theta \vdash^{\supseteq} \Xi, \Theta \vdash M, \Theta$; dom $(\Xi) \vdash N$ and Θ ; $\Xi \models$

 Θ ; $\Xi \models N \leqslant M \dashv C$, which is consequently, the same rule used to infer Θ ; $\Xi \models N \leqslant M \dashv C'$.

• (\uparrow^{\leq}) relies on unification, which is deterministic by Observation 7;

6682

6691

6692

6694

Specifically,

6713

Proof. We prove it by induction on Θ ; $\Xi \models \mathbb{N} \leq M \dashv \mathbb{C}$.

 Θ ; $\Xi \models N \leqslant M \dashv C$ and Θ ; $\Xi \models N \leqslant M \dashv C'$ then C = C'.

 $N \leq M = C$, then $\Xi \vdash C : fav(N)$ and for any normalized $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : C, \Theta \vdash [\widehat{\sigma}] N \leq M$.

Suppose that $\widehat{\sigma}$ is normalized and $\Xi \vdash \widehat{\sigma} : C$, Let us consider the last rule to infer this judgment.

, Vol. 1, No. 1, Article . Publication date: July 2024.

Case 1. $(\rightarrow^{\leqslant})$. Then Θ ; $\Xi \models \mathbb{N} \leqslant M \dashv C$ has shape Θ ; $\Xi \models \mathbb{P} \to \mathbb{N}' \leqslant \mathbb{Q} \to M' \dashv C$ On the next step, the the algorithm makes two recursive calls: Θ ; $\Xi \models \mathbb{P} \geqslant \mathbb{Q} \dashv C_1$ and Θ ; $\Xi \models \mathbb{N}' \leqslant M' \dashv C_2$ and returns $\Xi \vdash C_1 \& C_2 = C$ as the result.

By the soundness of constraint merge (Lemma 89), $\Xi \vdash \widehat{\sigma} : C_1$ and $\Xi \vdash \widehat{\sigma} : C_2$. Then by the soundness of positive subtyping (Lemma 86), $\Theta \vdash [\widehat{\sigma}] P \geqslant Q$; and by the induction hypothesis, $\Theta \vdash [\widehat{\sigma}] N' \leqslant M'$. This way, by $(\rightarrow^{\leqslant})$, $\Theta \vdash [\widehat{\sigma}] (P \rightarrow N') \leqslant Q \rightarrow M'$.

- **Case 2**. (VAR $^{\leq}$), and then Θ ; $\Xi \models \mathbb{N} \leqslant M \dashv C$ has shape Θ ; $\Xi \models \alpha^- \leqslant \alpha^- \dashv \cdot$ This case is symmetric to case 2 of Lemma 86.
- **Case 3**. (\uparrow^{\leq}), and then Θ ; $\Xi \models \mathbb{N} \leq M \dashv C$ has shape Θ ; $\Xi \models \uparrow \mathbb{P} \leq \uparrow \mathbb{Q} \dashv C$ This case is symmetric to case 3 of Lemma 86.
- Case 4. (\forall^{\leq}) , and then Θ ; $\Xi \models N \leq M \dashv C$ has shape Θ ; $\Xi \models \forall \overrightarrow{\alpha^+}$. $N' \leq \forall \overrightarrow{\beta^+}$. $M' \dashv C$ s.t. either $\overrightarrow{\alpha^+}$ or $\overrightarrow{\beta^+}$ is not empty

 This case is symmetric to case 4 of Lemma 86.

Lemma 93 (Completeness of the Negative Subtyping). Suppose that $\Theta \vdash^{\supseteq} \Xi, \Theta \vdash M, \Theta; dom(\Xi) \vdash N$, and N does not contain negative unification variables $(\widehat{\alpha}^{-} \notin fav(N))$. Then for any $\Xi \vdash \widehat{\sigma} : fav(N)$ such that $\Theta \vdash [\widehat{\sigma}] N \leq M$, there exists $\Theta; \Xi \models N \leq M \rightrightarrows C$ and moreover, $\Xi \vdash \widehat{\sigma} : C$.

Proof. We prove it by induction on $\Theta \vdash [\widehat{\sigma}] N \leq M$. Let us consider the last rule used in the derivation of $\Theta \vdash [\widehat{\sigma}] N \leq M$.

Case 1. $\Theta \vdash [\widehat{\sigma}] N \leq M$ is derived by (\uparrow^{\leq})

 Then $N = \uparrow P$, since the substitution $[\widehat{\sigma}]N$ must preserve the top-level constructor of $N \neq \widehat{\alpha}^-$ (since by assumption, $\widehat{\alpha}^- \notin \text{fav}(N)$), and $Q = \downarrow M$, and by inversion, $\Theta \vdash [\widehat{\sigma}]N \simeq^{\varsigma} M$. The rest of the proof is symmetric to case 3 of Lemma 87: notice that the algorithm does not make a recursive call, and the difference in the induction statement for the positive and the negative case here does not matter.

Case 2. $\Theta \vdash [\widehat{\sigma}] N \leq M$ is derived by (\to^{\leq}) , i.e. $[\widehat{\sigma}] N = [\widehat{\sigma}] P \to [\widehat{\sigma}] N'$ and $M = Q \to M'$, and by inversion, $\Theta \vdash [\widehat{\sigma}] P \geqslant Q$ and $\Theta \vdash [\widehat{\sigma}] N' \leq M'$.

The algorithm makes two recursive calls: Θ ; $\Xi \models \mathbb{P} \geqslant Q = C_1$ and Θ ; $\Xi \models \mathbb{N}' \leqslant \mathbb{N}' \neq C_2$, and then returns $\Xi \vdash C_1 \& C_2 = C$ as the result. Let us show that these recursive calls are successful and the returning constraints are fulfilled by $\widehat{\sigma}$.

Notice that from the inversion of $\Theta \vdash M$, we have: $\Theta \vdash Q$ and $\Theta \vdash M'$; from the inversion of Θ ; dom $(\Xi) \vdash N$, we have: Θ ; dom $(\Xi) \vdash P$ and Θ ; dom $(\Xi) \vdash N'$; and since N does not contain negative unification variables, N' does not contain negative unification variables either.

This way, we can apply the induction hypothesis to $\Theta \vdash [\widehat{\sigma}] N' \leq M'$ to obtain Θ ; $\Xi \models N' \leq M' \dashv C_2$ such that $\Xi \vdash C_2 : \mathsf{fav}(N')$ and $\Xi \vdash \widehat{\sigma} : C_2$. Also, we can apply the completeness

of the positive subtyping (Lemma 87) to $\Theta \vdash [\widehat{\sigma}] P \geqslant Q$ to obtain Θ ; $\Xi \models P \geqslant Q \dashv C_1$ such that $\Xi \vdash C_1 : \mathsf{fav}(P)$ and $\Xi \vdash \widehat{\sigma} : C_1$.

Finally, we need to show that the merge of C_1 and C_2 is successful and satisfies the required properties. To do so, we apply the completeness of subtyping constraint merge (Lemma 91) (notice that $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{P} \to \underline{N'})$ means $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{P}) \cup \mathsf{fav}(\underline{N'})$). This way, $\Xi \vdash C_1 \& C_2 = C$ is defined and $\Xi \vdash \widehat{\sigma} : C$ holds.

Case 3. $\Theta \vdash [\widehat{\sigma}] N \leq M$ is derived by (\forall^{\leq}) . Since N does not contain negative unification variables, N must be of the form $\forall \alpha^{+}$. N', such that $[\widehat{\sigma}] N = \forall \alpha^{+}$. $[\widehat{\sigma}] N'$ and $[\widehat{\sigma}] N' \neq \forall \dots$ (assuming α^{+} does not intersect with the range of $\widehat{\sigma}$). Also, $M = \forall \beta^{+}$. M' and either α^{+} or β^{+} is non-empty.

The rest of the proof is symmetric to case 4 of Lemma 87. To apply the induction hypothesis, we need to show additionally that there are no negative unification variables in $N_0 = [\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}]N'$. This is because $fav(N_0) \subseteq fav(N) \cup \overrightarrow{\alpha^+}$, and N is free of negative unification variables by assumption.

Case 4. $\Theta \vdash [\widehat{\sigma}] N \leq M$ is derived by (VAR^{\leq}) .

Then $N = [\widehat{\sigma}] N = \alpha^- = M$. Here the first equality holds because N is not a unification variable: by assumption, N is free of negative unification variables. The second and the third equations hold because (VAR \leq) was applied.

The rest of the proof is symmetric to case 2 of Lemma 87.

3.4 Declarative Typing

 Definition 30 (*Number of Prenex Quantifiers*). Let us define npq(N) and npq(P) as the number of prenex quantifiers in these types, i.e.

```
+ \operatorname{npq}(\exists \overrightarrow{\alpha} \cdot P) = |\overrightarrow{\alpha}|, \text{ if } P \neq \exists \overrightarrow{\beta} \cdot P',
```

-
$$\operatorname{npg}(\forall \overrightarrow{\alpha^+}, N) = |\overrightarrow{\alpha^+}|, \text{ if } N \neq \forall \overrightarrow{\beta^+}, N'.$$

Definition 31 (Size of a Declarative Judgement). For a declarative typing judgment J let us define a metrics size(J) as a pair of numbers in the following way:

```
+ size(\Theta; \Gamma \vdash \nu : P) = (size(\nu), 0);
```

- $\operatorname{size}(\Theta; \Gamma \vdash c : N) = (\operatorname{size}(c), 0);$
- $\operatorname{size}(\Theta; \Gamma \vdash N \bullet \overrightarrow{v} \Longrightarrow M) = (\operatorname{size}(\overrightarrow{v}), \operatorname{npq}(N)))$

where $\operatorname{size}(v)$ or $\operatorname{size}(c)$ is the size of the syntax tree of the term v or c and $\operatorname{size}(\overrightarrow{v})$ is the sum of sizes of the terms in \overrightarrow{v} .

, Vol. 1, No. 1, Article . Publication date: July 2024.

Definition 32 (*Number of Equivalence Nodes*). For a tree T inferring a declarative typing judgment, let us define a function eq_nodes(T) as the number of nodes in T labeled with (\simeq_{+}^{INF}) or (\simeq_{-}^{INF}).

- Definition 33 (*Metric*). For a tree T inferring a declarative typing judgment J, let us define a metric metric T as a pair (size(J), eq_nodes(T)).
- Lemma 57. If Θ ; $\Gamma \vdash N_1 \bullet \overrightarrow{v} \Longrightarrow M$ and $\Theta \vdash N_1 \cong N_2$ then Θ ; $\Gamma \vdash N_2 \bullet \overrightarrow{v} \Longrightarrow M$.

 Proof. By Lemma 34, $\Theta \vdash N_1 \cong N_2$ implies $N_1 \cong N_2$. Let us prove the required judgement by induction on $N_1 \cong N_2$. Let us consider the last rule used in the derivation.
 - Case 1. (VAR $^{\approx D}$). It means that N_1 is α^- and N_2 is α^- . Then the required property coincides with the assumption.
 - **Case 2.** (\uparrow^{\simeq^D}) . It means that N_1 is $\uparrow P_1$ and N_2 is $\uparrow P_2$, where $P_1 \simeq^D P_2$.

Then the only rule applicable to infer Θ ; $\Gamma \vdash \uparrow P_1 \bullet \overrightarrow{v} \implies M$ is $(\emptyset_{\bullet \Longrightarrow}^{\text{INF}})$, meaning that $\overrightarrow{v} =$ and $\Theta \vdash \uparrow P_1 \simeq^{\leqslant} M$. Then by transitivity of equivalence Corollary 10, $\Theta \vdash \uparrow P_2 \simeq^{\leqslant} M$, and then $(\emptyset_{\bullet \Longrightarrow}^{\text{INF}})$ is applicable to infer Θ ; $\Gamma \vdash \uparrow P_2 \bullet \Longrightarrow M$.

- **Case 3.** (\rightarrow^{\simeq^D}) . Then we are proving that $\Theta : \Gamma \vdash (Q_1 \rightarrow N_1) \bullet v, \overrightarrow{v} \implies M$ and $Q_1 \rightarrow N_1 \simeq^D$ $Q_2 \rightarrow N_2$ imply $\Theta : \Gamma \vdash (Q_2 \rightarrow N_2) \bullet v, \overrightarrow{v} \implies M$.
 - By inversion, $(Q_1 \to N_1) \simeq^D (Q_2 \to N_2)$ means $Q_1 \simeq^D Q_2$ and $N_1 \simeq^D N_2$.
 - By inversion of Θ ; $\Gamma \vdash (Q_1 \rightarrow N_1) \bullet v$, $\overrightarrow{v} \Longrightarrow M$:
 - (1) Θ ; $\Gamma \vdash \nu$: P

6821

6827

6839

6843

6847

6849 6850

6851 6852

6853 6854

6855 6856

6857 6858

6859 6860

- (2) $\Theta \vdash Q_1 \geqslant P$, and then by transitivity Lemma 24, $\Theta \vdash Q_2 \geqslant P$;
- (3) Θ ; $\Gamma \vdash N_1 \bullet \overrightarrow{v} \implies M$, and then by induction hypothesis, Θ ; $\Gamma \vdash N_2 \bullet \overrightarrow{v} \implies M$.

Since we have Θ ; $\Gamma \vdash \nu : P$, $\Theta \vdash Q_2 \geqslant P$ and Θ ; $\Gamma \vdash N_2 \bullet \overrightarrow{v} \implies M$, we can apply $(\rightarrow_{\bullet \Rightarrow}^{INF})$ to infer Θ ; $\Gamma \vdash (Q_2 \rightarrow N_2) \bullet \nu$, $\overrightarrow{v} \implies M$.

Case 4. (\forall^{\cong^D}) Then we are proving that $\Theta : \Gamma \vdash \forall \overrightarrow{\alpha^+}_1 . N'_1 \bullet \overrightarrow{v} \implies M$ and $\forall \overrightarrow{\alpha^+}_1 . N'_1 \simeq^D \forall \overrightarrow{\alpha^+}_2 . N'_2$ imply $\Theta : \Gamma \vdash \forall \overrightarrow{\alpha^+}_2 . N'_2 \bullet \overrightarrow{v} \implies M$.

By inversion of $\forall \overrightarrow{\alpha^+}_1. N'_1 \simeq^D \forall \overrightarrow{\alpha^+}_2. N'_2$:

- (1) $\overrightarrow{\alpha}_2 \cap \text{fv } N_1 = \emptyset$,
- (2) there exists a bijection $\mu: (\overrightarrow{\alpha^+}_2 \cap \text{fv } N_2') \leftrightarrow (\overrightarrow{\alpha^+}_1 \cap \text{fv } N_1')$ such that $N_1' \simeq^D [\mu] N_2'$.

By inversion of Θ ; $\Gamma \vdash \forall \overrightarrow{\alpha}^{+}_{1}$. $N'_{1} \bullet \overrightarrow{v} \Longrightarrow M$:

- (1) $\Theta \vdash \sigma : \overrightarrow{\alpha^+}_1$
- (2) $\Theta : \Gamma \vdash [\sigma] N'_1 \bullet \overrightarrow{v} \Longrightarrow M$

(3) $\overrightarrow{v} \neq$

 Let us construct $\Theta \vdash \sigma_0 : \overrightarrow{\alpha^+}_2$ in the following way:

$$\begin{cases} [\sigma_0]\alpha^+ = [\sigma][\mu]\alpha^+ & \text{if } \alpha^+ \in \overrightarrow{\alpha^+}_2 \cap \text{fv } N_2' \\ [\sigma_0]\alpha^+ = \exists \beta^-. \downarrow \beta^- & \text{otherwise (the type does not matter here)} \end{cases}$$

Then to infer Θ ; $\Gamma \vdash N_2 \bullet \overrightarrow{v} \implies M$, we apply $(\rightarrow_{\bullet \Longrightarrow}^{\text{INF}})$ with σ_0 . Let us show the required premises:

- (1) $\Theta \vdash \sigma_0 : \overrightarrow{\alpha^+}_2$ by construction;
- (2) $\overrightarrow{v} \neq$ as noted above;
- (3) To show Θ ; $\Gamma \vdash [\sigma_0]N_2' \bullet \overrightarrow{v} \implies M$, Notice that $[\sigma_0]N_2' = [\sigma][\mu]N_2'$ and since $[\mu]N_2' \simeq^D N_1'$, $[\sigma][\mu]N_2' \simeq^D [\sigma]N_1'$. This way, by Lemma 29, $\Theta \vdash [\sigma]N_1' \simeq^{\epsilon} [\sigma_0]N_2'$. Then the required judgement holds by the induction hypothesis applied to Θ ; $\Gamma \vdash [\sigma]N_1' \bullet \overrightarrow{v} \implies M$.

Lemma 50 (Declarative typing is preserved under context equivalence). Assuming $\Theta \vdash \Gamma_1$, $\Theta \vdash \Gamma_2$, and $\Theta \vdash \Gamma_1 \simeq^{\varsigma} \Gamma_2$:

- + for any tree T_1 inferring Θ ; $\Gamma_1 \vdash \nu : P$, there exists a tree T_2 inferring Θ ; $\Gamma_2 \vdash \nu : P$.
- − for any tree T_1 inferring Θ ; $\Gamma_1 \vdash c : N$, there exists a tree T_2 inferring Θ ; $\Gamma_2 \vdash c : N$.
- for any tree T_1 inferring Θ ; $\Gamma_1 \vdash N \bullet \overrightarrow{v} \implies M$, there exists a tree T_2 inferring Θ ; $\Gamma_2 \vdash N \bullet \overrightarrow{v} \implies M$.

Proof. Let us prove it by induction on the $metric(T_1)$. Let us consider the last rule applied in T_1 (i.e., its root node).

Case 1. (VAR^{INF})

Then we are proving that Θ ; $\Gamma_1 \vdash x : P$ implies Θ ; $\Gamma_2 \vdash x : P$. By inversion, $x : P \in \Gamma_1$, and since $\Theta \vdash \Gamma_1 \simeq^{\epsilon} \Gamma_2$, $x : P' \in \Gamma_2$ for some P' such that $\Theta \vdash P \simeq^{\epsilon} P'$. Then we infer Θ ; $\Gamma_2 \vdash x : P'$ by (VAR^{INF}) , and next, Θ ; $\Gamma_2 \vdash x : P$ by (\cong^{INF}) .

Case 2. For ($\{\}^{INF}$), (ANN_+^{INF}), (Λ^{INF}), (RET^{INF}), and (ANN_-^{INF}) the proof is analogous. We apply the induction hypothesis to the premise of the rule to substitute Γ_1 for Γ_2 in it. The induction is applicable because the metric of the premises is less than the metric of the conclusion: the term in the premise is a syntactic subterm of the term in the conclusion.

And after that, we apply the same rule to infer the required judgment.

Case 3. (\simeq_+^{INF}) and (\simeq_-^{INF}) In these cases, the induction hypothesis is also applicable to the premise: although the first component of the metric is the same for the premise and the conclusion: $\text{size}(\Theta; \Gamma \vdash c : N') = \text{size}(\Theta; \Gamma \vdash c : N) = \text{size}(c)$, the second component of the

metric is less for the premise by one, since the equivalence rule was applied to turn the premise tree into T1. Having made this note, we continue the proof in the same way as in the previous case.

Case 4. (λ^{INF}) Then we prove that Θ ; $\Gamma_1 \vdash \lambda x : P$. $c : P \to N$ implies Θ ; $\Gamma_2 \vdash \lambda x : P$. $c : P \to N$. Analogously to the previous cases, we apply the induction hypothesis to the equivalent contexts $\Theta \vdash \Gamma_1, x : P \simeq^c \Gamma_2, x : P$ and the premise Θ ; $\Gamma_1, x : P \vdash c : N$ to obtain Θ ; $\Gamma_2, x : P \vdash c : N$. Notice that c is a subterm of $\lambda x : P$. c, i.e., the metric of the premise tree is less than the metric of the conclusion, and the induction hypothesis is applicable. Then we infer Θ ; $\Gamma_2 \vdash \lambda x : P$. $c : P \to N$ by (λ^{INF}) .

Case 5. (LET^{INF}) Then we prove that Θ ; $\Gamma_1 \vdash \text{let } x = v$; c : N implies Θ ; $\Gamma_2 \vdash \text{let } x = v$; c : N. First, we apply the induction hypothesis to Θ ; $\Gamma_1 \vdash v : P$ to obtain Θ ; $\Gamma_2 \vdash v : P$ of the same size.

Then we apply the induction hypothesis to the equivalent contexts $\Theta \vdash \Gamma_1, x : P \simeq^{\leq} \Gamma_2, x : P$ and the premise $\Theta; \Gamma_1, x : P \vdash c : N$ to obtain $\Theta; \Gamma_2, x : P \vdash c : N$. Then we infer $\Theta; \Gamma_2 \vdash \text{let } x = v; c : N$ by (LET^{INF}).

Case 6. (LET_C^{INF}) Then we prove that Θ ; $\Gamma_1 \vdash \text{let } x : P = c$; c' : N implies Θ ; $\Gamma_2 \vdash \text{let } x : P = c$; c' : N.

First, we apply the induction hypothesis to Θ ; $\Gamma_1 \vdash c : M$ to obtain Θ ; $\Gamma_2 \vdash c : M$ of the same size.

Then we apply the induction hypothesis to the equivalent contexts $\Theta \vdash \Gamma_1, x : P \simeq^{\leq} \Gamma_2, x : P$ and the premise $\Theta; \Gamma_1, x : P \vdash c' : N$ to obtain $\Theta; \Gamma_2, x : P \vdash c' : N$. Then we infer $\Theta; \Gamma_2 \vdash \text{let } x : P = c; c' : N$ by $(\text{LET}_C^{\text{INF}})$.

Case 7. (LET^{INF}_@) Then we prove that Θ ; $\Gamma_1 \vdash \text{let } x = v(\overrightarrow{v})$; c : N implies Θ ; $\Gamma_2 \vdash \text{let } x = v(\overrightarrow{v})$; c : N.

We apply the induction hypothesis to each of the premises. to rewrite:

• Θ ; $\Gamma_1 \vdash \nu$: $\downarrow M$ into Θ ; $\Gamma_2 \vdash \nu$: $\downarrow M$,

- Θ ; $\Gamma_1 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow O$ into Θ ; $\Gamma_2 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow O$.
- Θ ; Γ_1 , $x : Q \vdash c : N$ into Θ ; Γ_2 , $x : Q \vdash c : N$ (notice that $\Theta \vdash \Gamma_1$, $x : Q \simeq^{\leq} \Gamma_2$, x : Q).

It is left to show the principality of Θ ; $\Gamma_2 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$. Let us assume that this judgment holds for other Q', i.e. there exists a tree T_0 inferring Θ ; $\Gamma_2 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q'$. Then notice that the induction hypothesis applies to T_0 : the first component of the first component of metric (T_0) is $S = \sum_{v \in \overrightarrow{v}} \operatorname{size}(v)$, and it is less than the corresponding component of metric (T_1) , which is $\operatorname{size}(\operatorname{let} x = v(\overrightarrow{v}); c) = 1 + \operatorname{size}(v) + \operatorname{size}(c) + S$. This way, Θ ; $\Gamma_1 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q'$ holds by the induction hypothesis, but since Θ ; $\Gamma_1 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$ is principal, we have $\Theta \vdash Q' \geqslant Q$. This way, Θ ; $\Gamma_2 \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$ principal. Then we infer Θ ; $\Gamma_2 \vdash \operatorname{let} x = v(\overrightarrow{v})$; $c \colon N$ by $(\operatorname{LET}_{\Theta}^{\operatorname{INF}})$.

Case 8. (LET: Then we prove that Θ ; $\Gamma_1 \vdash \text{let } x : P = \nu(\overrightarrow{v})$; c : N implies Θ ; $\Gamma_2 \vdash \text{let } x : P = \nu(\overrightarrow{v})$; c : N.

As in the previous case, we apply the induction hypothesis to each of the premises and rewrite:

• Θ ; $\Gamma_1 \vdash \nu$: $\downarrow M$ into Θ ; $\Gamma_2 \vdash \nu$: $\downarrow M$,

- $\Theta : \Gamma_1 \vdash M \bullet \overrightarrow{v} \implies M'$ into $\Theta : \Gamma_2 \vdash M \bullet \overrightarrow{v} \implies M'$, and
- Θ ; $\Gamma_1, x : P \vdash c : N$ into Θ ; $\Gamma_2, x : P \vdash c : N$ (notice that $\Theta \vdash \Gamma_1, x : P \simeq^{\leq} \Gamma_2, x : P$).

Notice that $\Theta \vdash P$ and $\Theta \vdash M' \leq \uparrow P$ do not depend on the variable context, and hold by assumption. Then we infer Θ ; $\Gamma_2 \vdash \text{let } x : P = v(\overrightarrow{v})$; c : N by (LET $^{\text{INF}}_{: \Theta}$).

Case 9. (LET $_{\exists}^{INF}$), and (ANN $_{-}^{INF}$) are proved in the same way.

Case 10. $(\emptyset_{\bullet \Longrightarrow}^{\text{INF}})$ Then we are proving that Θ ; $\Gamma_1 \vdash N \bullet \Longrightarrow N'$ (inferred by $(\emptyset_{\bullet \Longrightarrow}^{\text{INF}})$) implies Θ ; $\Gamma_2 \vdash N \bullet \Longrightarrow N'$.

To infer Θ ; $\Gamma_2 \vdash N \bullet \implies N'$, we apply $(\emptyset_{\bullet \Longrightarrow}^{\text{INF}})$, noting that $\Theta \vdash N \simeq^{\leq} N'$ holds by assumption.

Case 11. $(\to_{\bullet \Rightarrow}^{\text{INF}})$ Then we are proving that $\Theta : \Gamma_1 \vdash Q \to N \bullet v$, $\overrightarrow{v} \Longrightarrow M$ (inferred by $(\to_{\bullet \Rightarrow}^{\text{INF}})$) implies $\Theta : \Gamma_2 \vdash Q \to N \bullet v$, $\overrightarrow{v} \Longrightarrow M$. And uniqueness of the M in the first case implies uniqueness in the second case.

By induction, we rewrite Θ ; $\Gamma_1 \vdash v : P$ into Θ ; $\Gamma_2 \vdash v : P$, and Θ ; $\Gamma_1 \vdash N \bullet \overrightarrow{v} \implies M$ into Θ ; $\Gamma_2 \vdash N \bullet \overrightarrow{v} \implies M$. Then we infer Θ ; $\Gamma_2 \vdash Q \rightarrow N \bullet v$, $\overrightarrow{v} \implies M$ by $(\rightarrow^{\text{INF}}_{\bullet,\bullet})$.

Now, let us show the uniqueness. The only rule that can infer Θ ; $\Gamma_1 \vdash Q \rightarrow N \bullet v$, $\overrightarrow{v} \Longrightarrow M$ is $(\rightarrow_{\bullet \Longrightarrow}^{\text{INF}})$. Then by inversion, uniqueness of Θ ; $\Gamma_1 \vdash Q \rightarrow N \bullet v$, $\overrightarrow{v} \Longrightarrow M$ implies uniqueness of Θ ; $\Gamma_1 \vdash N \bullet \overrightarrow{v} \Longrightarrow M$. By the induction hypothesis, it implies the uniqueness of Θ ; $\Gamma_2 \vdash N \bullet \overrightarrow{v} \Longrightarrow M$.

Suppose that $\Theta : \Gamma_2 \vdash Q \to N \bullet v, \overrightarrow{v} \Longrightarrow M'$. By inversion, $\Theta : \Gamma_2 \vdash N \bullet \overrightarrow{v} \Longrightarrow M'$, which by uniqueness of $\Theta : \Gamma_2 \vdash N \bullet \overrightarrow{v} \Longrightarrow M$ implies $\Theta \vdash M \simeq^{\leq} M'$.

Case 12. $(\forall_{\bullet \Rightarrow}^{\text{INF}})$ Then we are proving that Θ ; $\Gamma_1 \vdash \forall \overrightarrow{\alpha^+}. N \bullet \overrightarrow{v} \implies M$ (inferred by $(\forall_{\bullet \Rightarrow}^{\text{INF}})$) implies Θ ; $\Gamma_2 \vdash \forall \overrightarrow{\alpha^+}. N \bullet \overrightarrow{v} \implies M$.

By inversion, we have σ such that $\Theta \vdash \sigma : \overrightarrow{\alpha^+}$ and $\Theta : \Gamma_1 \vdash [\sigma] N \bullet \overrightarrow{v} \implies M$ is inferred. Let us denote the inference tree as T_1' . Notice that the induction hypothesis is applicable to T_1' : metric $(T_1') = ((\operatorname{size}(\overrightarrow{v}), 0), x)$ is less than $\operatorname{metric}(T_1) = ((\operatorname{size}(\overrightarrow{v}), |\overrightarrow{\alpha^+}|), y)$ for any x and y, since $|\overrightarrow{\alpha^+}| > 0$ by inversion.

This way, by the induction hypothesis, there exists a tree T_2' inferring Θ ; $\Gamma_2 \vdash [\sigma] N \bullet \overrightarrow{v} \implies M$. Notice that the premises $\overrightarrow{v} \neq \Theta \vdash \sigma : \overrightarrow{\alpha^+}$, and $\overrightarrow{\alpha^+} \neq \cdot$ do not depend on the variable context, and hold by inversion. Then we infer Θ ; $\Gamma_2 \vdash \forall \overrightarrow{\alpha^+}$. $N \bullet \overrightarrow{v} \implies M$ by $(\bigvee_{\bullet \implies}^{\text{INF}})$.

3.5 Algorithmic Typing

 3.5.1 Singularity and Minimal Instantiation.

Lemma 94 (Soundness of Minimal Instantiation). Suppose that $\Theta \vdash^{\supseteq} \Xi, \Xi \vdash C$, and Θ ; dom $(\Xi) \vdash P$. If P is C-minimized by $\widehat{\sigma}$ then

- $\Xi \vdash \widehat{\sigma} : fav(\underline{P})$,
- $\Xi \vdash \widehat{\sigma} : C$,
- $\widehat{\sigma}$ is normalized, and
- for any other $\Xi \vdash \widehat{\sigma}' : \mathsf{fav}(\underline{P})$ respecting C (i.e., $\Xi \vdash \widehat{\sigma}' : C$), we have $\Theta \vdash [\widehat{\sigma}']\underline{P} \geqslant [\widehat{\sigma}]\underline{P}$.

Proof. We prove it by induction on the inference of \underline{P} is C-minimized by $\widehat{\sigma}$. Let us consider the last rule used in the inference.

Case 1. (UVAR^{MIN}), which means that the inferred judgment is $\widehat{\alpha}^+$ is C-minimized by $(nf(P)/\widehat{\alpha}^+)$, and by inversion, $(\widehat{\alpha}^+) \in C$. Let us show the required properties:

- $\Xi \vdash (\mathsf{nf}(P)/\widehat{\alpha}^+) : \mathsf{fav}(\widehat{\alpha}^+) \text{ holds trivially};$
- $\Xi \vdash (\mathsf{nf}(P)/\widehat{\alpha}^+) : C \text{ holds since } \Theta \vdash \mathsf{nf}(P) : (\widehat{\alpha}^+ : \geqslant P), \text{ which is true since } \Theta \vdash \mathsf{nf}(P) \geqslant P \text{ by the soundness of normalization (Lemma 41);}$
- $(nf(P)/\widehat{\alpha}^+)$ is normalized trivially;
- let us take an arbitrary $\Xi \vdash \widehat{\sigma}' : \widehat{\alpha}^+$ respecting C. Since $\widehat{\sigma}'$ respects C, $\Theta \vdash [\widehat{\sigma}'] \widehat{\alpha}^+ \geqslant P$ holds, and then $\Theta \vdash [\widehat{\sigma}'] \widehat{\alpha}^+ \geqslant \mathsf{nf}(P)$ holds by the soundness of normalization and transitivity of subtyping. Finally, $\Theta \vdash [\widehat{\sigma}'] \widehat{\alpha}^+ \geqslant \mathsf{nf}(P)$ can be rewritten as $\Theta \vdash [\widehat{\sigma}'] \widehat{\alpha}^+ \geqslant [(\mathsf{nf}(P)/\widehat{\alpha}^+)] \widehat{\alpha}^+$.

Case 2. (\exists^{\min}), which means that the inferred judgment has form $\exists \overrightarrow{\alpha}$. P is C-minimized by $\widehat{\sigma}$, and by inversion, P is C-minimized by $\widehat{\sigma}$. By applying the induction hypothesis to P is C-minimized by $\widehat{\sigma}$ we have

- $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{P})$, which also means $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\exists \overrightarrow{\alpha}^{\perp}, \underline{P})$,
- $\Xi \vdash \widehat{\sigma} : C$,
- $\widehat{\sigma}$ is normalized, and
- for any other $\Xi \vdash \widehat{\sigma}' : \mathsf{fav}(\underline{P})$ respecting C (i.e., $\Xi \vdash \widehat{\sigma}' : C$), we have $\Theta, \overrightarrow{\alpha} \vdash [\widehat{\sigma}'] \underline{P} \geqslant [\widehat{\sigma}] \underline{P}$, which immediately implies $\Theta \vdash [\widehat{\sigma}'] \exists \overrightarrow{\alpha} : \underline{P} \geqslant [\widehat{\sigma}] \exists \overrightarrow{\alpha} : \underline{P}$ (the left-hand side existential variables are instantiated with the corresponding right-hand side existential variables).

Case 3. (SING^{MIN}), which means that the inferred judgment has form P is C-minimized by $\widehat{\sigma}$, and by inversion, fav(P) \subseteq dom(C) and $C|_{\mathsf{fav}(P)}$ singular with $\widehat{\sigma}$. Let us apply the soundness of singularity (Lemma 98) to $C|_{\mathsf{fav}(P)}$ singular with $\widehat{\sigma}$ to obtain the following properties:

- $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{P}) \cap \mathsf{dom}(C)$, which also means $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{P})$,
- $\Xi \vdash \widehat{\sigma} : C|_{\mathsf{fav}(P)}$,

- $\widehat{\sigma}$ is normalized, and
- for any other $\Xi \vdash \widehat{\sigma}' : \mathsf{fav}(\underline{P})$ respecting $C|_{\mathsf{fav}(\underline{P})}$, we have $\Xi \vdash \widehat{\sigma}' \simeq^{\leqslant} \widehat{\sigma} : \mathsf{fav}(\underline{P})$. The latter means that $\Theta \vdash [\widehat{\sigma}']\underline{P} \simeq^{\leqslant} [\widehat{\sigma}]\underline{P}$, and in particular, $\Theta \vdash [\widehat{\sigma}']\underline{P} \geqslant [\widehat{\sigma}]\underline{P}$.

Lemma 95 (Completeness of Minimal Instantiation). Suppose that $\Theta \vdash^{\supseteq} \Xi, \Xi \vdash C, \Theta$; dom $(\Xi) \vdash P$, and there exists $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(P)$ respecting $C (\Xi \vdash \widehat{\sigma} : C)$ such that for any other $\Xi \vdash \widehat{\sigma}' : \mathsf{fav}(P)$ respecting $C (\Xi \vdash \widehat{\sigma}' : C)$, we have $\Theta \vdash [\widehat{\sigma}'] P \geqslant [\widehat{\sigma}] P$. Then P is C-minimized by $\mathsf{nf}(\widehat{\sigma})$.

Proof. We prove it by induction on P.

Case 1. $P = \widehat{\alpha}^+$. Suppose that $\widehat{\alpha}^+ \notin \text{dom}(C)$. Then the instantiation of $\widehat{\alpha}^+$ is not restricted, and thus, any type can instantiate it. However, among unrestricted instantiations, there is no minimum: any type P is *not* a subtype of $\downarrow \uparrow P$, which contradicts the assumption. This way, $\widehat{\alpha}^+ \in \text{dom}(C)$.

If the entry restricting $\widehat{\alpha}^+$ in C is a subtyping entry $((\widehat{\alpha}^+ : \geqslant Q) \in C)$, then we apply $(UVAR^{MIN})$ to infer $\widehat{\alpha}^+$ is C-minimized by $(nf(Q)/\widehat{\alpha}^+)$. It is left to show that $nf(Q) = nf([\widehat{\sigma}]\widehat{\alpha}^+)$. Since $\Xi \vdash \widehat{\sigma} : C$, and $(\widehat{\alpha}^+ : \geqslant Q) \in C$, we know that $\Theta \vdash [\widehat{\sigma}]\widehat{\alpha}^+ \geqslant Q$. On the other hand, let us consider $\Xi \vdash \widehat{\sigma}' : C$, that copies $\widehat{\sigma}$ on dom (C) except $\widehat{\alpha}^+$, where it is instantiated with Q. Then $\Theta \vdash [\widehat{\sigma}']\widehat{\alpha}^+ \geqslant [\widehat{\sigma}]\widehat{\alpha}^+$ means $\Theta \vdash Q \geqslant [\widehat{\sigma}]\widehat{\alpha}^+$, this way, $\Theta \vdash Q \simeq^{\varsigma} [\widehat{\sigma}]\widehat{\alpha}^+$, which by Lemma 48 means $nf(Q) = nf([\widehat{\sigma}]\widehat{\alpha}^+)$.

If the entry restricting $\widehat{\alpha}^+$ in C is an equivalence entry $((\widehat{\alpha}^+ :\simeq Q) \in C)$, then we wish to apply ($\operatorname{SING}^{\operatorname{MIN}}$). The first premise $\operatorname{fav}(\widehat{\alpha}^+) \subseteq \operatorname{dom}(C)$ holds by assumption; to infer $C|_{\widehat{\alpha}^+}$ singular with $\widehat{\sigma}_0$, we apply the completeness of singularity (Lemma 99). It applies because all the substitutions satisfying $C|_{\widehat{\alpha}^+} = (\widehat{\alpha}^+ :\simeq Q)$ are equivalent on $\widehat{\alpha}^+$ by transitivity of equivalence (Corollary 10): the satisfaction of this constraint means that the substitution sends $\widehat{\alpha}^+$ to Q or an equivalent type. This way, $C|_{\widehat{\alpha}^+}$ singular with $\widehat{\sigma}_0$ for some $\widehat{\sigma}_0$, which means $\widehat{\alpha}^+$ is C-minimized by $\widehat{\sigma}_0$. To show that $\widehat{\sigma}_0 = \operatorname{nf}(\widehat{\sigma})$ notice that Since $\widehat{\sigma}_0$ is normalized and equivalent to $\widehat{\sigma}$ on $\widehat{\alpha}^+$, and only has $\widehat{\alpha}^+$ in its domain (by soundness of singularity, Lemma 98). This way, $\widehat{\alpha}^+$ is C-minimized by $\widehat{\sigma}_0$, as required.

Case 2. $P = \bigcup N$. Then since $\Theta \vdash \bigcup [\widehat{\sigma}'] N \geqslant \bigcup [\widehat{\sigma}] N$ means $\Theta \vdash \bigcup [\widehat{\sigma}'] N \simeq^{\leqslant} \bigcup [\widehat{\sigma}] N$ by inversion. Then by Lemma 10, $\widehat{\sigma}$ is equivalent to any other substitution $\Xi \vdash \widehat{\sigma}' : \mathsf{fav}(N)$ satisfying $C|_{\mathsf{fav}(N)}$, hence, the completeness of singularity (Lemma 99) can be applied to conclude that

• $fav(N) = dom(C|_{fav(N)})$, then $fav(P) \subseteq dom(C)$,

 • $C|_{\mathsf{fav}(N)}$ singular with $\widehat{\sigma}_0$ for some (normalized) $\widehat{\sigma}_0$.

It means \underline{P} is C-minimized by $\widehat{\sigma}_0$, and then since $\widehat{\sigma}_0$ is normalized and equivalent to $\widehat{\sigma}_0$ on fav(N), and its domain is fav(N), $\widehat{\sigma}_0 = \text{nf}(\widehat{\sigma})$.

- Case 3. $P = \exists \overrightarrow{\alpha}^{-}$. β^{+} then as there are no algorithmic variables in P, nf ($[\widehat{\sigma}]P$) = β^{+} , and thus, we wish to show that $\exists \overrightarrow{\alpha}^{-}$. β^{+} is C-minimized by \cdot . To do so, we apply (\exists^{MIN}), and it is left to show that β^{+} is C-minimized by \cdot , which holds vacuously by (SING^{MIN}).
- Case 4. $P = \exists \overrightarrow{\alpha} \cdot \widehat{\alpha}^+$ then $\Theta \vdash [\widehat{\sigma}'] \exists \overrightarrow{\alpha} \cdot \widehat{\alpha}^+ \geqslant [\widehat{\sigma}] \exists \overrightarrow{\alpha} \cdot \widehat{\alpha}^+$ implies $\Theta \vdash \exists \overrightarrow{\alpha} \cdot \widehat{[\sigma']} \widehat{\alpha}^+ \geqslant [\widehat{\sigma}] \widehat{\alpha}^+$. It means that $\widehat{\sigma}$ instantiates $\widehat{\alpha}^+$ to the minimal type among all the instantiations of $\widehat{\alpha}^+$ respecting C. In other words, we can apply the reasoning from case 1 to conclude that $\widehat{\alpha}^+$ is C-minimized by nf $\widehat{(\sigma)}$. And then (\exists^{MIN}) gives us $\exists \overrightarrow{\alpha} \cdot \widehat{\alpha}^+$ is C-minimized by nf $\widehat{(\sigma)}$.
- Case 5. $P = \exists \overrightarrow{\alpha}. \downarrow N$ then $\Theta \vdash [\widehat{\sigma}'] \exists \overrightarrow{\alpha}. \downarrow N \geqslant \exists \overrightarrow{\alpha}. \downarrow [\widehat{\sigma}] N$ implies $\Theta \vdash \exists \overrightarrow{\alpha}. \downarrow [\widehat{\sigma}'] N \geqslant \exists \overrightarrow{\alpha}. \downarrow [\widehat{\sigma}] N$ implies $\Theta, \overrightarrow{\alpha} \vdash \downarrow [\sigma_0] [\widehat{\sigma}'] N \geqslant \downarrow [\widehat{\sigma}] N$ for some σ_0 implies $\Theta, \overrightarrow{\alpha} \vdash [\sigma_0] [\widehat{\sigma}'] N \simeq^{\varsigma} [\widehat{\sigma}] N$. By Lemma 10, it means in particular that $\widehat{\sigma}'$ and $\widehat{\sigma}$ are equivalent on fav(N). This way, we can apply the completeness of singularity (Lemma 99), and continue as in case 2 to conclude that $\downarrow N$ is C-minimized by $\inf(\widehat{\sigma})$. Then by (\exists^{MIN}), we have $\exists \overrightarrow{\alpha}. \downarrow N$ is C-minimized by $\inf(\widehat{\sigma})$.

Observation 17 (*Minimal Instantiation is Deterministic*). Suppose that $\Theta \vdash^{\supseteq} \Xi, \Xi \vdash C, \Theta; dom(\Xi) \vdash P$. Then P is C-minimized by $\widehat{\sigma}$ and P is C-minimized by $\widehat{\sigma}'$ implies $\widehat{\sigma} = \widehat{\sigma}'$.

Proof. We prove it by induction on \underline{P} is C-minimized by $\widehat{\sigma}$. It is easy to see that each inference rule is deterministic.

Lemma 96 (Soundness of Entry Singularity).

- + Suppose e singular with P for P well-formed in Θ . Then $\Theta \vdash P : e, P$ is normalized, and for any $\Theta \vdash P'$ such that $\Theta \vdash P' : e, \Theta \vdash P' \simeq^{\leq} P$;
- Suppose e singular with N for N well-formed in Θ . Then $\Theta \vdash N : e$, N is normalized, and for any $\Theta \vdash N'$ such that $\Theta \vdash N' : e$, $\Theta \vdash N' \simeq^{\leqslant} N$.

Proof. Let us consider how e singular with P or e singular with N is formed.

- **Case 1.** $(\simeq_{-}^{\text{SING}})$, that is $e = \widehat{\alpha}^- :\simeq N_0$. and N is $\inf(N_0)$. Then $\Theta \vdash N' : e$ means $\Theta \vdash N' \simeq^{\leqslant} N_0$, (by inversion of $(:\simeq_{-}^{\text{SAT}})$), which by transitivity, using Corollary 16, means $\Theta \vdash N' \simeq^{\leqslant} \inf(N_0)$, as required.
- **Case 2.** ($\simeq^{\text{SING}}_{\perp}$). This case is symmetric to the previous one.
- Case 3. $(:\geqslant \alpha^{\text{SING}})$, that is $e = \widehat{\alpha}^+ : \geqslant \exists \overrightarrow{\alpha}^- . \beta^+$, and $P = \beta^+$.

, Vol. 1, No. 1, Article . Publication date: July 2024.

Since $\Theta \vdash \beta^+ \geqslant \exists \overrightarrow{\alpha}^-$. β^+ , we have $\Theta \vdash \beta^+$: e, as required.

Notice that $\Theta \vdash P' : e$ means $\Theta \vdash P' \geqslant \exists \overrightarrow{\alpha}^{-}. \beta^{+}$. Let us show that it implies $\Theta \vdash P' \simeq^{\leqslant} \beta^{+}$. By applying Lemma 77 once, we have $\Theta, \overrightarrow{\alpha}^{-} \vdash P' \geqslant \beta^{+}$. By applying it again, we notice that $\Theta, \overrightarrow{\alpha}^{-} \vdash P' \geqslant \beta^{+}$ implies $P_{i} = \exists \overrightarrow{\alpha}^{-}'. \beta^{+}$. Finally, it is easy to see that $\Theta \vdash \exists \overrightarrow{\alpha}^{-}'. \beta^{+} \simeq^{\leqslant} \beta^{+}$

Case 4. $(:>\downarrow^{SING})$, that is $e = \widehat{\alpha}^+ :> \exists \overrightarrow{\beta}^- . \downarrow N_1$, where $N_1 \simeq^D \beta^-_i$, and $P = \exists \alpha^- . \downarrow \alpha^-$.

Since $\Theta \vdash \exists \alpha^-. \downarrow \alpha^- \geqslant \exists \overrightarrow{\beta^-}. \downarrow N_1$ (by (\exists^{\geqslant}) , with substitution N_1/α^-), we have $\Theta \vdash \exists \alpha^-. \downarrow \alpha^- : e$, as required.

Notice $\Theta \vdash P' : e \text{ means } \Theta \vdash P' \geqslant \exists \overrightarrow{\beta^-}. \downarrow N_1$. Let us show that it implies $\Theta \vdash P' \simeq^{\leqslant} \exists \alpha^-. \downarrow \alpha^-$. $\Theta \vdash P' \geqslant \exists \overrightarrow{\beta^-}. \downarrow N_1 \Rightarrow \Theta \vdash \mathsf{nf}(P') \geqslant \exists \overrightarrow{\beta^-}'. \downarrow \mathsf{nf}(N_1)$

$$(\text{where ord } \overrightarrow{\beta}^{-} \text{ in } N' = \overrightarrow{\beta}^{-}') \qquad \text{by Corollary 17}$$

$$\Rightarrow \Theta \vdash \mathsf{nf}(P') \geqslant \exists \overrightarrow{\beta}^{-}' . \, \mathsf{lnf}(\beta^{-}_{j}) \qquad \mathsf{by Lemma 44}$$

$$\Rightarrow \Theta \vdash \mathsf{nf}(P') \geqslant \exists \overrightarrow{\beta}^{-}' . \, \mathsf{lnf}(\beta^{-}_{j}) \qquad \mathsf{by definition of normalization}$$

$$\Rightarrow \Theta \vdash \mathsf{nf}(P') \geqslant \exists \beta^{-}_{j} . \, \mathsf{lnf}(\beta^{-}_{j}) \qquad \mathsf{since ord } \overrightarrow{\beta}^{-} \text{ in nf}(N_{1}) = \beta^{-}_{j}$$

$$\Rightarrow \Theta, \beta^{-}_{j} \vdash \mathsf{nf}(P') \geqslant \mathsf{ln}(\beta^{-}_{j}) \qquad \mathsf{lnn}(N_{1}) = \beta^{-}_{j}$$

$$\Rightarrow \Theta, \beta^{-}_{j} \vdash \mathsf{nf}(P') \geqslant \mathsf{ln}(\beta^{-}_{j}) \qquad \mathsf{lnn}(N_{1}) = \beta^{-}_{j}$$

$$\Rightarrow \Theta, \beta^{-}_{j} \vdash \mathsf{ln}(P') \geqslant \mathsf{ln}(N_{1}) = \beta^{-}_{j}$$

$$\Rightarrow \Theta, \beta^{-}_{j} \vdash \mathsf{ln}(P') \geqslant \mathsf{ln}(N_{1}) = \beta^{-}_{j}$$

$$\Rightarrow \Theta, \beta^{-}_{j} \vdash \mathsf{ln}(P') \geqslant \mathsf{ln}(P') \Rightarrow \mathsf{ln}(P$$

By Lemma 78, the last subtyping means that $\inf(P') = \exists \overrightarrow{\alpha} : \downarrow N'$, such that

- (1) $\Theta, \beta^{-}_{i}, \overrightarrow{\alpha}^{-} \vdash N'$
- (2) ord $\overrightarrow{\alpha}$ in $N' = \overrightarrow{\alpha}$
- (3) for some substitution Θ , $\beta^{-}_{j} \vdash \sigma : \overrightarrow{\alpha}^{-}$, $[\sigma]N' = \beta^{-}_{j}$.

Since $\beta^-_j \notin \text{fv}(\text{nf}(P'))$, the latter means that $N' = \alpha^-$, and then $\text{nf}(P') = \exists \alpha^- . \downarrow \alpha^-$ for some α^- . Finally, notice that all the types of shape $\exists \alpha^- . \downarrow \alpha^-$ are equal.

Lemma 97 (Completeness of Entry Singularity).

- Suppose that there exists N well-formed in Θ such that for any N' well-formed in Θ , $\Theta \vdash N' : e$ implies $\Theta \vdash N' \simeq^{\leq} N$. Then e singular with nf(N).
- + Suppose that there exists P well-formed in Θ such that for any P' well-formed in Θ , $\Theta \vdash P' : e$ implies $\Theta \vdash P' \simeq^{\leq} P$. Then e singular with $\mathsf{nf}(P)$.

Proof.

 - By Lemma 84, there exists Θ ⊢ N' : e. Since N' is negative, by inversion of Θ ⊢ N' : e, e has shape $\widehat{\alpha}^-$:≃ M, where Θ ⊢ N' ≃ M, and transitively, Θ ⊢ N ≃ M. Then nf M = nf M, and M is rewritten as M singular with nf M (by (\cong_{∞}^{SING})) is rewritten as M singular with nf M.

+ By Lemma 84, there exists $\Theta \vdash P' : e$, then by assumption, $\Theta \vdash P' \simeq^{\leq} P$, which by Lemma 85 implies $\Theta \vdash P : e$.

Let us consider the shape of *e*:

7244 7245

7246

7247

7248 7249

7250

7251 7252

- **Case 1**. $e = (\widehat{\alpha}^+ :\simeq Q)$ then inversion of $\Theta \vdash P : e$ implies $\Theta \vdash P \simeq^{\leqslant} Q$, and hence, nf (P) = nf(Q) (by Lemma 48). Then e singular with nf (Q), which holds by (\simeq_+^{SING}) , is rewritten as e singular with nf (P).
- **Case 2**. $e = (\widehat{\alpha}^+ : \ge Q)$. Then the inversion of $\Theta \vdash P : e$ implies $\Theta \vdash P \ge Q$. Let us consider the shape of Q:
 - a. $Q = \exists \overrightarrow{\beta^-}. \beta^+$ (for potentially empty $\overrightarrow{\beta^-}$). Then $\Theta \vdash P \geqslant \exists \overrightarrow{\beta^-}. \beta^+$ implies $\Theta \vdash P \simeq^{\leqslant} \beta^+$ by Lemma 77, as was noted in the proof of Lemma 96, and hence, $P = \beta^+$.

Then e singular with β^+ , which holds by (:> α^{SING}), can be rewritten as e singular with nf (P).

b. $Q = \exists \overrightarrow{\beta^-}. \downarrow N$ (for potentially empty $\overrightarrow{\beta^-}$). Notice that $\Theta \vdash \exists \gamma^-. \downarrow \gamma^- \geqslant \exists \overrightarrow{\beta^-}. \downarrow N$ (by (\exists^{\geqslant}) , with substitution N/γ^-), and thus, $\Theta \vdash \exists \gamma^-. \downarrow \gamma^- : e$ by $(:\geqslant^{SAT})$.

Then by assumption, $\Theta \vdash \exists \gamma^-. \downarrow \gamma^- \simeq^{\leqslant} P$, that is $\mathsf{nf}(P) = \exists \gamma^-. \downarrow \gamma^-$. To apply $(:\geqslant\downarrow^{\mathsf{SING}})$ to infer $(\widehat{\alpha}^+:\geqslant \exists \widehat{\beta}^-. \downarrow N)$ singular with $\exists \gamma^-. \downarrow \gamma^-$, it is left to show that $N \simeq^D \beta^-$, for some i.

Since $\Theta \vdash Q : e$, by assumption, $\Theta \vdash Q \simeq^{<} P$, and by transitivity, $\Theta \vdash Q \simeq^{<} \exists \gamma^{-}. \downarrow \gamma^{-}$. It implies $\inf (\exists \overrightarrow{\beta^{-}}. \downarrow N) = \exists \gamma^{-}. \downarrow \gamma^{-}$ (by Lemma 48), which by definition of normalization means $\exists \overrightarrow{\beta^{-}}'. \downarrow \inf (N) = \exists \gamma^{-}. \downarrow \gamma^{-}$, where $\operatorname{ord} \overrightarrow{\beta^{-}} \inf N' = \overrightarrow{\beta^{-}}'.$ This way, $\overrightarrow{\beta^{-}}'$ is a variable β^{-} , and $\operatorname{nf} (N) = \beta^{-}$. Notice that $\beta^{-} \in \overrightarrow{\beta^{-}}' \subseteq \overrightarrow{\beta^{-}}$ by Lemma 35. This way, $N \simeq^{D} \beta^{-}$ for $\beta^{-} \in \overrightarrow{\beta^{-}}$ (by Lemma 48),

Lemma 98 (Soundness of Singularity). Suppose $\Xi \vdash C : \widehat{\Theta}$, and C singular with $\widehat{\sigma}$. Then $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$, $\Xi \vdash \widehat{\sigma} : C$, $\widehat{\sigma}$ is normalized, and for any $\widehat{\sigma}'$ such that $\Xi \vdash \widehat{\sigma} : C$, $\Xi \vdash \widehat{\sigma}' \simeq^{\leqslant} \widehat{\sigma} : \widehat{\Theta}$.

Proof. Suppose that $\Xi \vdash \widehat{\sigma}' : C$. It means that for every $e \in C$ restricting $\widehat{\alpha}^{\pm}$, $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}']\widehat{\alpha}^{\pm} : e$ holds. C singular with $\widehat{\sigma}$ means e singular with $[\widehat{\sigma}]\widehat{\alpha}^{\pm}$, and hence, by Lemma 97, $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}']\widehat{\alpha}^{\pm} \simeq^{\leqslant} [\widehat{\sigma}]\widehat{\alpha}^{\pm}$ holds.

Since the uniqueness holds for every variable from dom (C), $\widehat{\sigma}$ is equivalent to $\widehat{\sigma}'$ on this set. \Box

- **Observation 18** (*Singularity is Deterministic*). For a fixed C such that $\Xi \vdash C : \widehat{\Theta}$, if C singular with $\widehat{\sigma}$ and C singular with $\widehat{\sigma}'$, then $\widehat{\sigma} = \widehat{\sigma}'$.
- **Proof.** By Lemma 98, $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$ and $\Xi \vdash \widehat{\sigma}' : \widehat{\Theta}$. It means that both $\widehat{\sigma}$ and $\widehat{\sigma}'$ act as identity outside of $\widehat{\Theta}$.
- Moreover, for any $\widehat{\alpha}^{\pm} \in \widehat{\Theta}$, $\Xi \vdash C : \widehat{\Theta}$ means that there is a unique $e \in C$ restricting $\widehat{\alpha}^{\pm}$. Then C singular with $\widehat{\sigma}$ means that e singular with $[\widehat{\sigma}]\widehat{\alpha}^{\pm}$. By looking at the inference rules, it is easy

to see that $[\widehat{\sigma}]\widehat{\alpha}^{\pm}$ is uniquely determined by e, which, Similarly, $[\widehat{\sigma}']\widehat{\alpha}^{\pm}$ is also uniquely determined by e, in the same way, and hence, $[\widehat{\sigma}]\widehat{\alpha}^{\pm} = [\widehat{\sigma}']\widehat{\alpha}^{\pm}$.

Lemma 99 (Completeness of Singularity). For a given $\Xi \vdash C$, suppose that all the substitutions satisfying C are equivalent on $\widehat{\Theta} \supseteq \text{dom}(C)$. In other words, suppose that there exists $\Xi \vdash \widehat{\sigma}_1 : \widehat{\Theta}$ such that for any $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$, $\Xi \vdash \widehat{\sigma} : C$ implies $\Xi \vdash \widehat{\sigma} \simeq^{\leqslant} \widehat{\sigma}_1 : \widehat{\Theta}$. Then

- C singular with $\widehat{\sigma}_0$ for some $\widehat{\sigma}_0$ and
- $\widehat{\Theta} = \text{dom}(C)$.

 Proof. First, let us assume $\widehat{\Theta} \neq \text{dom}(C)$. Then there exists $\widehat{\alpha}^{\pm} \in \widehat{\Theta} \setminus \text{dom}(C)$. Let us take $\Xi \vdash \widehat{\sigma}_1 : \widehat{\Theta}$ such that any other substitution $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}$ satisfying C is equivalent to $\widehat{\sigma}_1$ on $\widehat{\Theta}$.

Notice that $\Xi \vdash \widehat{\sigma}_1 : C$: by Lemma 84, there exists $\widehat{\sigma}'$ such that $\Xi \vdash \widehat{\sigma}' : \widehat{\Theta}$ and $\Xi \vdash \widehat{\sigma}' : C$, and by assumption, $\Xi \vdash \widehat{\sigma}' \simeq^{\leqslant} \widehat{\sigma}_1 : \widehat{\Theta}$, implying $\Xi \vdash \widehat{\sigma}' \simeq^{\leqslant} \widehat{\sigma}_1 : \text{dom}(C)$.

Let us construct $\widehat{\sigma}_2$ such that $\Xi \vdash \widehat{\sigma}_2 : \widehat{\Theta}$ as follows:

$$\begin{cases} [\widehat{\sigma}_2]\widehat{\beta}^{\pm} = [\widehat{\sigma}_1]\widehat{\beta}^{\pm} & \text{if } \widehat{\beta}^{\pm} \neq \widehat{\alpha}^{\pm} \\ [\widehat{\sigma}_2]\widehat{\alpha}^{\pm} = T & \text{where } T \text{ is any closed type not equivalent to } [\widehat{\sigma}_1]\widehat{\alpha}^{\pm} \end{cases}$$

It is easy to see that $\Xi \vdash \widehat{\sigma}_2 : C$ since $\widehat{\sigma}_1|_{\mathsf{dom}\,(C)} = \widehat{\sigma}_2|_{\mathsf{dom}\,(C)}$, and $\Xi \vdash \widehat{\sigma}_1 : C$. However, $\Xi \vdash \widehat{\sigma}_2 \simeq^{\leqslant} \widehat{\sigma}_1 : \widehat{\Theta}$ does not hold because by construction, $\Xi(\widehat{\alpha}^{\pm}) \vdash [\widehat{\sigma}_2]\widehat{\alpha}^{\pm} \simeq^{\leqslant} [\widehat{\sigma}_1]\widehat{\alpha}^{\pm}$ does not hold. This way, we have a contradiction.

Second, let us show C singular with $\widehat{\sigma}_0$. Let us take arbitrary $e \in C$ restricting $\widehat{\beta}^{\pm}$. We need to show that e is singular. Notice that $\Xi \vdash \widehat{\sigma}_1 : C$ implies $\Xi(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_1]\widehat{\beta}^{\pm}$ and $\Xi(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_1]\widehat{\beta}^{\pm}$: e. We will show that any other type satisfying e is equivalent to $[\widehat{\sigma}_1]\widehat{\beta}^{\pm}$, then by Lemma 97, e singular with $[\widehat{\sigma}_1]\widehat{\beta}^{\pm}$.

• if $\widehat{\beta}^{\pm}$ is positive, let us take any type $\Xi(\widehat{\beta}^{\pm}) \vdash P'$ and assume $\Xi(\widehat{\beta}^{\pm}) \vdash P' : e$. We will show that $\Xi(\widehat{\beta}^{\pm}) \vdash P' \simeq^{\epsilon} [\widehat{\sigma}_1] \widehat{\beta}^{\pm}$, which by Lemma 48 will imply e singular with $\mathsf{nf}([\widehat{\sigma}_1] \widehat{\beta}^{\pm})$.

Let us construct $\widehat{\sigma}_2$ such that $\Xi \vdash \widehat{\sigma}_2 : \widehat{\Theta}$ as follows:

$$\begin{cases} [\widehat{\sigma}_2] \widehat{\gamma}^{\pm} = [\widehat{\sigma}_1] \widehat{\gamma}^{\pm} & \text{if } \widehat{\gamma}^{\pm} \neq \widehat{\beta}^{\pm} \\ [\widehat{\sigma}_2] \widehat{\beta}^{\pm} = P' \end{cases}$$

It is easy to see that $\Xi \vdash \widehat{\sigma}_2 : C : \text{for } e, \Xi(\widehat{\beta}^\pm) \vdash [\widehat{\sigma}_2] \widehat{\beta}^\pm : e \text{ by construction, since } \Xi(\widehat{\beta}^\pm) \vdash P' : e;$ for any other $e' \in C$ restricting $\widehat{\gamma}^\pm$, $[\widehat{\sigma}_2] \widehat{\gamma}^\pm = [\widehat{\sigma}_1] \widehat{\gamma}^\pm$, and $\Xi(\widehat{\gamma}^\pm) \vdash [\widehat{\sigma}_1] \widehat{\gamma}^\pm : e' \text{ since } \Xi \vdash \widehat{\sigma}_1 : C.$

Then by assumption, $\Xi \vdash \widehat{\sigma}_2 \simeq^{\leqslant} \widehat{\sigma}_1 : \widehat{\Theta}$, which in particular means $\Xi(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_2]\widehat{\beta}^{\pm} \simeq^{\leqslant} [\widehat{\sigma}_1]\widehat{\beta}^{\pm}$, that is $\Xi(\widehat{\beta}^{\pm}) \vdash P' \simeq^{\leqslant} [\widehat{\sigma}_1]\widehat{\beta}^{\pm}$.

• if $\widehat{\beta}^{\pm}$ is negative, the proof is analogous.

7302 3.5.2 Correctness of the Typing Algorithm.

 Lemma 100 (*Determinacy of typing algorithm*). Suppose that $\Theta \vdash \Gamma$ and $\Theta \vdash^{\supseteq} \Xi$. Then

- + If Θ ; $\Gamma \models v : P$ and Θ ; $\Gamma \models v : P'$ then P = P'.
- If Θ ; $\Gamma \models c$: N and Θ ; $\Gamma \models c$: N' then N = N'.
- If $\Theta : \Gamma : \Xi \models N \bullet \overrightarrow{v} \implies M \dashv \Xi' : C \text{ and } \Theta : \Gamma : \Xi \models N \bullet \overrightarrow{v} \implies M' \dashv \Xi' : C' \text{ then } M = M', \Xi = \Xi', \text{ and } C = C'.$

Proof. We show it by structural induction on the inference tree. Notice that the last rule used to infer the judgement is uniquely determined by the input, and that each premise of each inference rule is deterministic by the corresponding observation.

Let us extend the declarative typing metric (Definition 33) to the algorithmic typing.

Definition 34 (*Size of an Algorithmic Judgement*). For an algorithmic typing judgement J let us define a metrics size(J) as a pair of numbers in the following way:

- + size(Θ ; $\Gamma \models \nu : P$) = (size(ν), 0);
- $-\operatorname{size}(\Theta; \Gamma \models c : N) = (\operatorname{size}(c), 0);$
- $\operatorname{size}(\Theta; \Gamma; \Xi \models N \bullet \overrightarrow{v} \Longrightarrow M \ni \Xi'; C) = (\operatorname{size}(\overrightarrow{v}), \operatorname{npg}(N)))$

Definition 35 (*Metric*). We extend the metric from Definition 33 to the algorithmic typing in the following way. For a tree T inferring an algorithmic typing judgement J, we define metric(T) as (size(J), 0).

Soundness and completeness are proved by mutual induction on the metric of the inference tree.

Lemma 101 (Soundness of typing). Suppose that $\Theta \vdash \Gamma$. For an inference tree T_1 ,

- + If T_1 infers Θ ; $\Gamma \models \nu$: P then $\Theta \vdash P$ and Θ ; $\Gamma \vdash \nu$: P
- − If T_1 infers Θ; Γ \models c: N then Θ \vdash N and Θ; Γ \vdash c: N
- If T_1 infers Θ ; Γ ; $\Xi \models \mathbb{N} \bullet \overrightarrow{v} \Longrightarrow \mathbb{M} \ni \Xi'$; C for $\Theta \vdash^{\supseteq} \Xi$ and Θ ; dom $(\Xi) \vdash \mathbb{N}$ free from negative algorithmic variables, then
 - (1) Θ ⊢[⊇] Ξ'
 - (2) $\Xi \subseteq \Xi'$
 - (3) Θ ; dom $(\Xi') \vdash M$
 - (4) $dom(\Xi) \cap fav(\underline{M}) \subseteq fav(\underline{N})$
 - (5) M is normalized and free from negative algorithmic variables

151

The Proofs (6) $\Xi'|_{\mathsf{fav}(N)\cup\mathsf{fav}(M)} \vdash C$ 7351 7352 **Proof.** We prove it by induction on metric (T_1) , mutually with the completeness of typing (Lemma 101). Let us consider the last rule task to interval derivation: C implies Θ ; $\Gamma \vdash [\sigma] N \bullet \vec{v} \implies [\widehat{\sigma}] M$ 7353 7354 7355 7356 7357 **Case 1.** (VAR^{INF}) We are proving that if Θ ; $\Gamma \models x$: nf (P) then $\Theta \vdash$ nf (P) and Θ ; $\Gamma \vdash x$: nf (P). 7358 7359 By inversion, $x : P \in \Gamma$. Since $\Theta \vdash \Gamma$, we have $\Theta \vdash P$, and by Corollary 14, $\Theta \vdash \mathsf{nf}(P)$. 7360 7361 By applying (VAR^{INF}) to $x: P \in \Gamma$, we infer $\Theta; \Gamma \vdash x: P$. Finally, by $(\simeq^{\text{INF}}_{+})$, since $\Theta \vdash P \simeq^{\leq}$ 7362 nf (\underline{P}) (Corollary 16), we have Θ; Γ ⊢ x: nf (\underline{P}). 7363 7364 Case 2. $({}^{\text{INF}})$ 7365 We are proving that if Θ ; $\Gamma \models \{c\}$: $\rfloor N$ then $\Theta \vdash \rfloor N$ and Θ ; $\Gamma \vdash \{c\}$: $\rfloor N$. 7366 7367 By inversion of Θ ; $\Gamma \models \{c\}$: $\downarrow N$, we have Θ ; $\Gamma \models c$: N. By the induction hypothesis applied 7368 to Θ ; $\Gamma \models c : N$, we have 7370 (1) $\Theta \vdash N$, and hence, $\Theta \vdash \downarrow N$; 7372 (2) Θ ; $\Gamma \vdash c$: N, which by $(\{\}^{INF})$ implies Θ ; $\Gamma \vdash \{c\}$: $\downarrow N$. 7374 Case 3. (RET^{INF}) The proof is symmetric to the previous case (case 2). Case 4. (ANN₊^{INF}) We are proving that if Θ ; $\Gamma \models (\nu : Q)$: $\mathsf{nf}(Q)$ then $\Theta \vdash \mathsf{nf}(Q)$ and Θ ; $\Gamma \vdash (v : O)$: nf (O). 7378 By inversion of Θ ; $\Gamma \models (\nu : \mathcal{O})$: nf (\mathcal{O}) , we have: 7380 (1) $\Theta \vdash (v : Q)$, hence, $\Theta \vdash Q$, and by Corollary 14, $\Theta \vdash \mathsf{nf}(Q)$; 7382 (2) Θ ; $\Gamma \models v : P$, which by the induction hypothesis implies $\Theta \vdash P$ and Θ ; $\Gamma \vdash v : P$; 7384 (3) Θ ; $\vdash Q \geqslant P \dashv \cdot$, which by Lemma 86 implies $\Theta \vdash [\cdot] Q \geqslant P$, that is $\Theta \vdash Q \geqslant P$. 7386 To infer Θ ; $\Gamma \vdash (v : O) : O$, we apply (ANN_{\perp}^{INF}) to Θ ; $\Gamma \vdash v : P$ and $\Theta \vdash O \geqslant P$. Then by (\cong_{\perp}^{INF}) , 7387 Θ ; $\Gamma \vdash (v : O)$: nf (O). 7388 Case 5. (ANN_N The proof is symmetric to the previous case (case 4). 7390 7391 Case 6. (λ^{INF}) We are proving that if Θ ; $\Gamma \models \lambda x : P$. $c : \text{nf}(P \to N)$ then $\Theta \vdash \text{nf}(P \to N)$ and Θ ; $\Gamma \vdash \lambda x : P$. $c : \mathsf{nf}(P \to N)$. 7392 7393 By inversion of Θ ; $\Gamma \models \lambda x : P$. c: nf $(P \to N)$, we have $\Theta \vdash \lambda x : P$. c, which implies $\Theta \vdash P$. 7394 7395 Also by inversion of Θ ; $\Gamma \models \lambda x : P$. $c : \mathsf{nf}(P \to N)$, we have Θ ; $\Gamma, x : P \models c : N$, applying

7396

7397 7398 7399 induction hypothesis to which gives us:

 (1) $\Theta \vdash N$, thus $\Theta \vdash P \to N$, and by Corollary 14, $\Theta \vdash \mathsf{nf}(P \to N)$;

(2) $\Theta; \Gamma, x : P \vdash c : N$, which by (λ^{INF}) implies $\Theta; \Gamma \vdash \lambda x : P \cdot c : P \to N$, and by (\simeq_+^{INF}) , $\Theta; \Gamma \vdash \lambda x : P \cdot c : \text{nf}(P \to N)$.

Case 7. (Λ^{INF}) We are proving that if Θ ; $\Gamma \models \Lambda \alpha^+$. c: $\mathsf{nf}(\forall \alpha^+, N)$ then Θ ; $\Gamma \vdash \Lambda \alpha^+$. c: $\mathsf{nf}(\forall \alpha^+, N)$ and $\Theta \vdash \mathsf{nf}(\forall \alpha^+, N)$.

By inversion of Θ , α^+ ; $\Gamma \models c : N$, we have $\Theta \vdash \Lambda \alpha^+$. c, which implies Θ , $\alpha^+ \vdash c$.

Also by inversion of Θ , α^+ ; $\Gamma \models c : N$, we have Θ , α^+ ; $\Gamma \models c : N$. Obtaining the induction hypothesis to Θ , α^+ ; $\Gamma \models c : N$, we have:

- (1) $\Theta, \alpha^+ \vdash N$, thus $\Theta \vdash \forall \alpha^+$. N, and by Corollary 14, $\Theta \vdash \mathsf{nf}(\forall \alpha^+, N)$;
- (2) Θ , α^+ ; $\Gamma \vdash c : N$, which by (Λ^{INF}) implies Θ ; $\Gamma \vdash \Lambda \alpha^+$. $c : \forall \alpha^+$. N, and by (\simeq_+^{INF}) , Θ ; $\Gamma \vdash \Lambda \alpha^+$. $c : \text{nf}(\forall \alpha^+, N)$.

Case 8. (LET INF) We are proving that if Θ ; $\Gamma \models \text{let } x = v$; c : N then Θ ; $\Gamma \vdash \text{let } x = v$; c : N and $\Theta \vdash N$.

By inversion of Θ ; $\Gamma \models \text{let } x = v$; c : N, we have:

- (1) Θ ; $\Gamma \models \nu : P$, which by the induction hypothesis implies $\Theta \vdash P$ (and thus, $\Theta \vdash \Gamma, x : P$) and Θ ; $\Gamma \vdash \nu : P$;
- (2) Θ ; Γ , $x : P \models c : N$, which by the induction hypothesis implies $\Theta \vdash N$ and Θ ; Γ , $x : P \vdash c : N$.

This way, Θ ; $\Gamma \vdash \text{let } x = v$; c : N holds by (LET^{INF}).

Case 9. (LET_C^{INF}) We are proving that if Θ ; $\Gamma \models \text{let } x : P = c$; c' : N then Θ ; $\Gamma \vdash \text{let } x : P = c$; c' : N and $\Theta \vdash N$.

By inversion of Θ ; $\Gamma \models \text{let } x : P = c$; c' : N, we have:

- (1) Θ ; $\Gamma \models c : M$, which by the induction hypothesis implies $\Theta \vdash M$ and Θ ; $\Gamma \vdash c : M$;
- (2) Θ ; $\cdot \models M \le \uparrow P \Rightarrow \cdot$, which by the soundness of negative subtyping (Lemma 92) means $\Theta \models M \le \uparrow P$:
- (3) Θ ; Γ , x: $P \models c'$: N, which by the induction hypothesis implies $\Theta \vdash N$ and Θ ; Γ , x: $P \vdash c'$: N.

This way, Θ ; $\Gamma \vdash \text{let } x : P = c$; c' : N holds by (LET_C^{INF}).

Case 10. (LET: NF) We are proving that if Θ ; $\Gamma \models \text{let } x : P = v(\vec{v})$; c' : N then Θ ; $\Gamma \vdash \text{let } x : P = v(\vec{v})$; c' : N and $\Theta \vdash N$.

By inversion, we have:

7449 (1) $\Theta \vdash P$, hence, $\Theta \vdash \Gamma, x : P$

(2) Θ ; $\Gamma \models \nu : \downarrow M$

- (3) $\Theta : \Gamma : \cdot \models M \bullet \overrightarrow{v} \Longrightarrow M' = \Xi : C_1$
- (4) Θ ; $\Xi \models M' \leqslant \uparrow P \Rightarrow C_2$
- (5) $\Xi \vdash C_1 \& C_2 = C$
- (6) Θ ; Γ , $x : P \models c' : N$

By the induction hypothesis applied to Θ ; $\Gamma \models \nu : \downarrow M$, we have Θ ; $\Gamma \vdash \nu : \downarrow M$ and $\Theta \vdash \downarrow M$ (and hence, Θ ; dom $(\Xi) \vdash M$).

By the induction hypothesis applied to Θ ; Γ , $x : P \models c' : N$, we have Θ ; Γ , $x : P \vdash c' : N$ and $\Theta \vdash N$.

By the induction hypothesis applied to Θ ; Γ ; $\cdot \models M \bullet \overrightarrow{v} \implies M' \dashv \Xi$; C_1 , we have:

- (1) Θ ⊢[⊇] Ξ,
- (2) Θ ; dom $(\Xi) \vdash M'$,
- (3) $\Xi'|_{fav(M)\cup fav(Q)} \vdash C_1$, and thus, $dom(C_1) \subseteq fav(M) \cup fav(M')$.
- (4) for any $\Xi' \vdash \widehat{\sigma} : C_1$, we have $\Theta : \Gamma \vdash [\widehat{\sigma}] M \bullet \overrightarrow{v} \Longrightarrow [\widehat{\sigma}] M'$.

By soundness of negative subtyping (Lemma 92) applied to Θ ; $\Xi \models M' \leqslant \uparrow P \rightrightarrows C_2$, we have $\Xi \vdash C_2 : \mathsf{fav}(M')$, and thus, $\mathsf{fav}(M') = \mathsf{dom}(C_2)$.

By soundness of constraint merge (Lemma 89), $\operatorname{dom}(C) = \operatorname{dom}(C_1) \cup \operatorname{dom}(C_2) \subseteq \operatorname{fav}(M) \cup \operatorname{fav}(M')$ Then by Lemma 84, let us take $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : \operatorname{fav}(M) \cup \operatorname{fav}(M')$ and $\Xi \vdash \widehat{\sigma} : C$. By the soundness of constraint merge, $\Xi \vdash \widehat{\sigma} : C_1$ and $\Xi \vdash \widehat{\sigma} : C_2$, and by weakening, $\Xi' \vdash \widehat{\sigma} : C_1$ and $\Xi' \vdash \widehat{\sigma} : C_2$.

Then as noted above (4), Θ ; $\Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow [\widehat{\sigma}]M'$ And again, by the soundness of negative subtyping (Lemma 92) applied to Θ ; $\Xi \vDash M' \leqslant \uparrow P \rightrightarrows C_2$, we have $\Theta \vdash [\widehat{\sigma}]M' \leqslant \uparrow P$.

To infer Θ ; $\Gamma \vdash \text{let } x : P = v(\overrightarrow{v})$; c' : N, we apply the corresponding declarative rule $(\text{LET}_{:(\widehat{O})}^{\text{INF}})$, where Q is $[\widehat{\sigma}]$ Q. Notice that all the premises were already shown to hold above:

- (1) $\Theta \vdash P$ and Θ ; $\Gamma \vdash v : \downarrow M$ from the assumption,
- (2) Θ ; $\Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow [\widehat{\sigma}] M'$ holds as noted above,
- (3) $\Theta \vdash [\widehat{\sigma}] M' \leq \uparrow P$ by soundness of negative subtyping,
- (4) Θ ; Γ , $x : P \vdash c' : N$ from the induction hypothesis.

Case 11. (LET $^{\text{INF}}_{@}$) We are proving that if Θ ; $\Gamma \models \text{let } x = v(\overrightarrow{v})$; c' : N then Θ ; $\Gamma \vdash \text{let } x = v(\overrightarrow{v})$; c' : N and $\Theta \vdash N$.

By the inversion, we have:

(1) Θ ; $\Gamma \models \nu$: $\downarrow M$,

- (2) Θ ; Γ ; $\cdot \models M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q = \Xi$; C,
- (3) Q is C-minimized by $\widehat{\sigma}$, and
- (4) Θ ; Γ , $x : [\widehat{\sigma}] \bigcirc \models c' : N$.

By the induction hypothesis applied to Θ ; $\Gamma \models v : \downarrow M$, we have Θ ; $\Gamma \vdash v : \downarrow M$ and $\Theta \vdash \downarrow M$ (and thus, Θ ; dom $(\Xi) \vdash M$).

By the induction hypothesis applied to $\Theta; \Gamma, x : [\widehat{\sigma}] Q \models c' : N$, we have $\Theta \vdash N$ and $\Theta; \Gamma, x : [\widehat{\sigma}] Q \vdash c' : N$.

By the induction hypothesis applied to Θ ; Γ ; $\vdash M \bullet \overrightarrow{v} \Rightarrow \uparrow Q = \Xi$; C, we have:

- (1) Θ ⊢[⊇] Ξ
- (2) Θ ; dom $(\Xi) \vdash \uparrow \bigcirc$
- (3) $\Xi|_{\mathsf{fav}(M)\cup\mathsf{fav}(Q)} \vdash C$ (and thus, $\mathsf{dom}(C) \subseteq \mathsf{fav}(M) \cup \mathsf{fav}(Q)$)
- (4) for any $\Xi \vdash \widehat{\sigma} : C$, we have $\Theta : \Gamma \vdash [\widehat{\sigma}] M \bullet \overrightarrow{v} \Longrightarrow [\widehat{\sigma}] \uparrow Q$, which, since M is ground means $\Theta : \Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow [\widehat{\sigma}] Q$.

To infer Θ ; $\Gamma \vdash \text{let } x = v(\overrightarrow{v})$; c' : N, we apply the corresponding declarative rule (LET_@). Let us show that the premises hold:

- Θ ; $\Gamma \vdash \nu$: $\downarrow M$ holds by the induction hypothesis;
- Θ ; Γ , $x : [\widehat{\sigma}] O \vdash c' : N$ also holds by the induction hypothesis, as noted above;
- Θ : $\Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow [\widehat{\sigma}] \bigcirc \text{holds}$, as noted above;
- To show the principality of $\uparrow [\widehat{\sigma}] Q$, we assume that for some other type R holds $\Theta : \Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow R$, that is $\Theta : \Gamma \vdash [\cdot] M \bullet \overrightarrow{v} \Longrightarrow \uparrow R$. Then by the completeness of typing (Lemma 102), there exist N', Ξ' , and C' such that
 - (1) $\Theta: \Gamma: \cdot \models M \bullet \overrightarrow{v} \implies N' = \Xi': C'$ and
 - (2) there exists a substitution $\Xi' \vdash \widehat{\sigma}' : C'$ such that $\Theta \vdash [\widehat{\sigma}'] N' \simeq ^{\leq} \uparrow \mathbb{R}$.

By determinacy of the typing algorithm (Lemma 100), $\Theta : \Gamma : \vdash M \bullet \overrightarrow{v} \implies N' = \Xi' : C'$, means that C' is C, Ξ' is Ξ , and N' is $\uparrow Q$. This way, $\Theta \vdash [\widehat{\sigma}'] \uparrow Q \simeq^{\leqslant} \uparrow R$ for substitution $\Xi \vdash \widehat{\sigma}' : C$. To show the principality, it suffices to notice that $\Theta \vdash R \geqslant [\widehat{\sigma}] Q$ or

equivalently $\Theta \vdash [\widehat{\sigma}'] Q \geqslant [\widehat{\sigma}] Q$, which holds by the soundness of the minimal instantiation (Lemma 94) since Q is C-minimized by $\widehat{\sigma}$.

Case 12. (LET $_{\exists}^{\text{INF}}$) We are proving that if Θ ; $\Gamma \models \text{let}^{\exists}(\overrightarrow{\alpha}, x) = v$; c' : N then Θ ; $\Gamma \vdash \text{let}^{\exists}(\overrightarrow{\alpha}, x) = v$; c' : N and $\Theta \vdash N$. By the inversion, we have:

- (1) Θ ; $\Gamma \models \nu$: $\exists \overrightarrow{\alpha}$. P
- (2) Θ , $\overrightarrow{\alpha}$: Γ , $x : P \models c' : N$
- (3) $\Theta \vdash N$

7590

7591 7592

7593

7594 7595 By the induction hypothesis applied to Θ ; $\Gamma \models v : \exists \overrightarrow{\alpha} : P$, we have Θ ; $\Gamma \vdash v : \exists \overrightarrow{\alpha} : P$ and $\exists \overrightarrow{\alpha} : P$ is normalized. By the induction hypothesis applied to Θ , $\overrightarrow{\alpha} : \Gamma$, $x : P \models c' : N$, we have Θ , $\overrightarrow{\alpha} : \Gamma$, $x : P \models c' : N$.

To show Θ ; $\Gamma \vdash \mathsf{let}^\exists(\overrightarrow{\alpha}, x) = v$; c' : N, we apply the corresponding declarative rule (LET $^{\mathsf{INF}}_\exists$). Let us show that the premises hold:

- (1) Θ ; $\Gamma \vdash \nu$: $\exists \overrightarrow{\alpha}$. P holds by the induction hypothesis, as noted above,
- (2) $\operatorname{nf}(\exists \overrightarrow{\alpha}, P) = \exists \overrightarrow{\alpha}, P \text{ holds since } \exists \overrightarrow{\alpha}, P \text{ is normalized,}$
- (3) $\Theta, \overrightarrow{\alpha}^2$; $\Gamma, x : P \vdash c' : N$ also holds by the induction hypothesis,
- (4) $\Theta \vdash N$ holds by the inversion, as noted above.

Case 13. $(\emptyset_{\bullet \Rightarrow}^{\text{INF}})$ Then by assumption:

- Θ ⊢[⊇] Ξ,
- Θ ; dom $(\Xi) \vdash N$ is free from negative algorithmic variables,
- $\Theta: \Gamma: \Xi \models \mathbb{N} \bullet \Longrightarrow \mathsf{nf}(\mathbb{N}) \not\exists \Xi: \cdot$

Let us show the required properties:

- (1) $\Theta \vdash^{\supseteq} \Xi$ holds by assumption,
- (2) $\Xi \subseteq \Xi$ holds trivially,
- (3) $\mathsf{nf}(N)$ is evidently normalized, Θ ; $\mathsf{dom}(\Xi) \vdash N$ implies Θ ; $\mathsf{dom}(\Xi) \vdash \mathsf{nf}(N)$ by Corollary 24, and Lemma 40 means that $\mathsf{nf}(N)$ is inherently free from negative algorithmic variables,
- (4) $dom(\Xi) \cap fav(nf(N)) \subseteq fav(N)$ holds since fav(nf(N)) = fav(N),
- (5) $\Xi|_{\mathsf{fav}(N)\cup\mathsf{fav}(\mathsf{nf}(N))} \vdash \cdot \mathsf{holds} \mathsf{trivially},$
- (6) suppose that $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(N) \cup \mathsf{fav}(\mathsf{nf}(N))$. To show $\Theta ; \Gamma \vdash [\widehat{\sigma}] N \bullet \Longrightarrow [\widehat{\sigma}] \mathsf{nf}(N)$, we apply the corresponding declarative rule $(\emptyset^{\mathsf{INF}}_{\bullet \Longrightarrow})$. To show $\Theta \vdash [\widehat{\sigma}] N \simeq^{\leqslant} [\widehat{\sigma}] \mathsf{nf}(N)$, we

apply the following sequence: $N \simeq^D \inf(N)$ by Lemma 41, then $[\widehat{\sigma}]N \simeq^D [\widehat{\sigma}]\inf(N)$ by Corollary 21, then $\Theta \vdash [\widehat{\sigma}]N \simeq^{\epsilon} [\widehat{\sigma}]\inf(N)$ by Lemma 29.

Case 14. $(\rightarrow^{\text{INF}}_{\bullet\Rightarrow})$ By assumption:

(1) $\Theta \vdash^{\supseteq} \Xi$,

- (2) Θ ; dom $(\Xi) \vdash Q \rightarrow N$ is free from negative algorithmic variables, and hence, so are Q and N,
- (3) Θ ; Γ ; $\Xi \models Q \rightarrow N \bullet v$, $\overrightarrow{v} \implies M = \Xi'$; C, and by inversion:
 - (a) Θ ; $\Gamma \models v : P$, and by the induction hypothesis applied to this judgment, we have Θ ; $\Gamma \vdash v : P$, and $\Theta \vdash P$;
 - (b) Θ ; $\Xi \models Q \geqslant P \Rightarrow C_1$, and by the soundness of subtyping: $\Xi \vdash C_1 : \mathsf{fav}(Q)$ (and thus, $\mathsf{dom}(C_1) = \mathsf{fav}(Q)$), and for any

$$\Xi \vdash \widehat{\sigma} : C_1$$
, we have $\Theta \vdash [\widehat{\sigma}] Q \geqslant P$;

- (c) Θ ; Γ ; $\Xi \models \mathbb{N} \bullet \overrightarrow{v} \implies M \ni \Xi'$; C_2 , and by the induction hypothesis applied to this judgment,
 - (i) $\Theta \vdash^{\supseteq} \Xi'$.
 - (ii) $\Xi \subseteq \Xi'$,
 - (iii) Θ ; dom $(\Xi') \vdash M$ is normalized and free from negative algorithmic variables,
 - (iv) dom $(\Xi) \cap \text{fav}(M) \subseteq \text{fav}(N)$,
 - (v) $\Xi'|_{\mathsf{fav}(M)\cup\mathsf{fav}(N)} \vdash C_2$, and thus, $\mathsf{dom}(C_2) \subseteq \mathsf{fav}(M) \cup \mathsf{fav}(N)$,
 - (vi) for any $\widehat{\sigma}$ such that $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{M}) \cup \mathsf{fav}(\underline{N})$ and $\Xi' \vdash \widehat{\sigma} : C_2$, we have $\Theta : \Gamma \vdash [\widehat{\sigma}] \underline{N} \bullet \overrightarrow{v} \Longrightarrow [\widehat{\sigma}] \underline{M}$;
- (d) $\Xi \vdash C_1 \& C_2 = C$, which by Lemma 89 implies $dom(C) = dom(C_1) \cup dom(C_2) \subseteq fav(Q) \cup fav(M) \cup fav(N)$.

Let us show the required properties:

- (1) $\Theta \vdash^{\supseteq} \Xi'$ is shown above,
- (2) $\Xi \subseteq \Xi'$ is shown above,
- (3) Θ ; dom $(\Xi') \vdash M$ is normalized and free from negative algorithmic variables, as shown above,
- (4) $dom(\Xi) \cap fav(M) \subseteq fav(N) \subseteq fav(Q \to N)$ (the first inclusion is shown above, the second one is by definition),

 (5) To show $\Xi'|_{\mathsf{fav}(Q)\cup\mathsf{fav}(N)\cup\mathsf{fav}(M)} \vdash C$, first let us notice that $\mathsf{fav}(Q)\cup\mathsf{fav}(N)\cup\mathsf{fav}(M)\cup\mathsf{fav}(M)$ $\subseteq \mathsf{dom}(C)$, as mentioned above. Then we demonstrate $\Xi' \vdash C : \Xi \vdash C_1$ and $\Xi \subseteq \Xi'$ imply $\Xi' \vdash C_1$, by the soundness of constraint merge (Lemma 89) applied to $\Xi' \vdash C_1 \& C_2 = C$:

- (a) $\Xi' \vdash C$,
- (b) for any $\Xi' \vdash \widehat{\sigma} : C, \Xi' \vdash \widehat{\sigma} : C_i$ holds;
- (6) Suppose that $\Xi' \vdash \widehat{\sigma} : \mathsf{fav}(Q) \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)$ and $\Xi' \vdash \widehat{\sigma} : C$. To show $\Theta : \Gamma \vdash [\widehat{\sigma}](Q \to N) \bullet \nu, \overrightarrow{v} \Longrightarrow [\widehat{\sigma}]M$, that is $\Theta : \Gamma \vdash [\widehat{\sigma}]Q \to [\widehat{\sigma}]N \bullet \nu, \overrightarrow{v} \Longrightarrow [\widehat{\sigma}]M$, we apply the corresponding declarative rule $(\to_{\bullet \Longrightarrow}^{\mathsf{INF}})$. Let us show the required premises:
 - (a) Θ ; $\Gamma \vdash \nu$: **P** holds as shown above,

 - (c) Θ ; $\Gamma \vdash [\widehat{\sigma}] N \bullet \overrightarrow{v} \Longrightarrow [\widehat{\sigma}] M$ holds by the induction hypothesis as shown above, since $\Xi' \vdash \widehat{\sigma} : C$ implies $\Xi' \vdash \widehat{\sigma} : C_2$, and then $\Xi' \vdash \widehat{\sigma}|_{\mathsf{fav}(N) \cup \mathsf{fav}(M)} : C_2$ and $\Xi \vdash \widehat{\sigma}|_{\mathsf{fav}(N) \cup \mathsf{fav}(M)} : \mathsf{fav}(N) \cup \mathsf{fav}(M)$.

Case 15. $(\forall_{\bullet \Rightarrow}^{INF})$ By assumption:

- (1) $\Theta \vdash^{\supseteq} \Xi$,
- (2) Θ ; dom $(\Xi) \vdash \forall \overrightarrow{\alpha}^{+}$. N is free from negative algorithmic variables,
- (3) Θ ; Γ ; $\Xi \models \forall \overrightarrow{\alpha^+}$. $N \bullet \overrightarrow{v} \implies M = \Xi'$; C, which by inversion means $\overrightarrow{v} \neq , \overrightarrow{\alpha^+} \neq \cdot$, and Θ ; Γ ; Ξ , $\overrightarrow{\alpha^+} \{\Theta\} \models [\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}] N \bullet \overrightarrow{v} \implies M = \Xi'$; C. It is easy to see that the induction hypothesis is applicable to the latter judgment:
 - $\Theta \vdash^{\supseteq} \Xi, \overrightarrow{\alpha}^{+} \{\Theta\} \text{ holds by } \Theta \vdash^{\supseteq} \Xi,$
 - Θ ; dom (Ξ) , $\overrightarrow{\alpha^+} \vdash [\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}] \underline{N}$ holds since Θ ; dom $(\Xi) \vdash \forall \overrightarrow{\alpha^+}. \underline{N} [\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}] \underline{N}$ is normalized and free from negative algorithmic variables since so is \underline{N} ;

This way, by the inductive hypothesis applied to Θ ; Γ ; Ξ , $\overrightarrow{\alpha}^+$ $\{\Theta\} \models [\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+] N \bullet \overrightarrow{v} \Longrightarrow M \dashv \Xi'$; C, we have:

- (a) $\Theta \vdash^{\supseteq} \Xi'$,
- (b) $\Xi, \overrightarrow{\widehat{\alpha}^+} \{\Theta\} \subseteq \Xi',$
- (c) Θ ; dom $(\Xi') \vdash M$ is normalized and free from negative algorithmic variables,
- (d) $\operatorname{dom}(\Xi, \overrightarrow{\alpha^{+}}\{\Theta\}) \cap \operatorname{fav}(M) \subseteq \operatorname{fav}([\overrightarrow{\alpha^{+}}/\overrightarrow{\alpha^{+}}]N),$

- (e) $\Xi'|_{\widehat{\Theta} \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)} \vdash C$, where $\widehat{\Theta}$ denotes $\mathsf{fav}([\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}]N) \cap \overrightarrow{\widehat{\alpha}^+}$, that is the algorithmization of the \forall -variables that are actually used in N.
- (f) for any $\widehat{\sigma}$ such that $\Xi' \vdash \widehat{\sigma} : \widehat{\Theta} \cup \mathsf{fav}(\underline{N}) \cup \mathsf{fav}(\underline{M})$ and $\Xi' \vdash \widehat{\sigma} : C$, we have $\Theta : \Gamma \vdash [\widehat{\sigma}][\overrightarrow{\alpha^+}/\overrightarrow{\alpha^+}]\underline{N} \bullet \overrightarrow{v} \Longrightarrow [\widehat{\sigma}]\underline{M}$.

Let us show the required properties:

- (1) $\Theta \vdash^{\supseteq} \Xi'$ is shown above;
- (2) $\Xi \subseteq \Xi'$ since $\Xi, \overrightarrow{\widehat{\alpha}^+} \{\Theta\} \subseteq \Xi';$
- (3) Θ ; dom $(\Xi') \vdash M$ is normalized and free from negative algorithmic variables, as shown above;
- (4) $\operatorname{dom}(\Xi) \cap \operatorname{fav}(M) \subseteq \operatorname{fav}(N)$ since $\operatorname{dom}(\Xi, \overrightarrow{\alpha}^+ \{\Theta\}) \cap \operatorname{fav}(M) \subseteq \operatorname{fav}([\overrightarrow{\alpha}^+ / \overrightarrow{\alpha}^+] N)$ implies $(\operatorname{dom}(\Xi) \cup \overrightarrow{\alpha}^+) \cap \operatorname{fav}(M) \subseteq \operatorname{fav}(N) \cup \overrightarrow{\alpha}^+$, thus, $\operatorname{dom}(\Xi) \cap \operatorname{fav}(M) \subseteq \operatorname{fav}(N) \cup \overrightarrow{\alpha}^+$, and since $\operatorname{dom}(\Xi)$ is disjoint with $\overrightarrow{\alpha}^+$, $\operatorname{dom}(\Xi) \cap \operatorname{fav}(M) \subseteq \operatorname{fav}(N)$;
- (5) $\Xi'|_{\mathsf{fav}(N)\cup\mathsf{fav}(M)} \vdash C|_{\mathsf{fav}(N)\cup\mathsf{fav}(M)}$ follows from $\Xi'|_{\widehat{\Theta}\cup\mathsf{fav}(N)\cup\mathsf{fav}(M)} \vdash C$ if we restrict both sides to $\mathsf{fav}(N)\cup\mathsf{fav}(M)$.
- (6) Let us assume $\Xi' \vdash \widehat{\sigma} : \mathsf{fav}(N) \cup \mathsf{fav}(M)$ and $\Xi' \vdash \widehat{\sigma} : C|_{\mathsf{fav}(N) \cup \mathsf{fav}(M)}$. Then to show $\Theta : \Gamma \vdash [\widehat{\sigma}] \forall \overrightarrow{\alpha^{\dagger}}. N \bullet \overrightarrow{v} \implies [\widehat{\sigma}] M$, that is $\Theta : \Gamma \vdash \forall \overrightarrow{\alpha^{\dagger}}. [\widehat{\sigma}] N \bullet \overrightarrow{v} \implies [\widehat{\sigma}] M$, we apply the corresponding declarative rule $(\forall^{\mathsf{INF}}_{\bullet \implies})$. To do so, we need to provide a substitution for $\overrightarrow{\alpha^{\dagger}}$, i.e. $\Theta \vdash \sigma_0 : \overrightarrow{\alpha^{\dagger}}$ such that $\Theta : \Gamma \vdash [\sigma_0][\widehat{\sigma}] N \bullet \overrightarrow{v} \implies [\widehat{\sigma}] M$.

By Lemma 84, we construct $\widehat{\sigma}_0$ such that $\Xi' \vdash \widehat{\sigma}_0 : \overrightarrow{\alpha}^+$ and $\Xi' \vdash \widehat{\sigma}_0 : C|_{\overrightarrow{\Xi}}$.

Then σ_0 is defined as $\widehat{\sigma}_0 \circ \widehat{\sigma}|_{\overrightarrow{\alpha}^+} \circ \overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}$.

Let us show that the premises of $(\forall_{\bullet \Longrightarrow}^{INF})$ hold:

- To show $\Theta \vdash \sigma_0 : \overrightarrow{\alpha^+}$, let us take $\alpha_i^+ \in \overrightarrow{\alpha^+}$. If $\widehat{\alpha_i}^+ \in \mathsf{fav}(M)$ then $[\sigma_0]\alpha_i^+ = [\widehat{\sigma}]\widehat{\alpha_i}^+$, and $\Xi' \vdash \widehat{\sigma} : \mathsf{fav}(N) \cup \mathsf{fav}(M)$ implies $\Xi'(\widehat{\alpha}^+) \vdash [\widehat{\sigma}]\widehat{\alpha}^+$. Analogously, if $\widehat{\alpha_i}^+ \in \widehat{\alpha^+} \setminus \mathsf{fav}(M)$ then $[\sigma_0]\alpha_i^+ = [\widehat{\sigma}_0]\widehat{\alpha_i}^+$, and $\Xi' \vdash \widehat{\sigma}_0 : \widehat{\alpha^+}$ implies $\Xi'(\widehat{\alpha_i}^+) \vdash [\widehat{\sigma}_0]\widehat{\alpha_i}^+$. In any case, $\Xi'(\widehat{\alpha_i}^+) \vdash [\sigma]\alpha_i^+$ can be weakened to $\Theta \vdash [\sigma_0]\alpha_i^+$, since $\Theta \vdash^{\Xi} \Xi'$.
- Let us show Θ ; $\Gamma \vdash [\sigma_0][\widehat{\sigma}] \underline{N} \bullet \overrightarrow{v} \Longrightarrow [\widehat{\sigma}] \underline{M}$. It suffices to construct $\widehat{\sigma}_1$ such that
 - (a) $\Xi' \vdash \widehat{\sigma}_1 : \widehat{\Theta} \cup \mathsf{fav}(\underline{N}) \cup \mathsf{fav}(\underline{M})$,
 - (b) $\Xi' \vdash \widehat{\sigma}_1 : C$,
 - (c) $[\sigma_0][\widehat{\sigma}]N = [\widehat{\sigma}_1][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N$, and
 - (d) $[\widehat{\sigma}]M = [\widehat{\sigma}_1]M$,

because then we can apply the induction hypothesis (3f) to $\widehat{\sigma}_1$, rewrite the conclusion by $[\widehat{\sigma}_1][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N = [\sigma_0][\widehat{\sigma}]N$ and $[\widehat{\sigma}_1]M = [\widehat{\sigma}]M$, and infer the required judgement.

Let us take $\widehat{\sigma}_1 = (\widehat{\sigma}_0 \circ \widehat{\sigma})|_{\widehat{\Theta} \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)}$, then

- (a) $\Xi' \vdash \widehat{\sigma}_1 : \widehat{\Theta} \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)$, since $\Xi' \vdash \widehat{\sigma}_0 : \overrightarrow{\alpha}^+$ and $\Xi' \vdash \widehat{\sigma} : \mathsf{fav}(N) \cup \mathsf{fav}(M)$, we have $\Xi' \vdash \widehat{\sigma}_0 \circ \widehat{\sigma} : \overrightarrow{\alpha}^+ \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)$, which we restrict to $\widehat{\Theta} \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)$.
- (b) $\Xi' \vdash \widehat{\sigma}_1 : C$, Let us take any constraint $e \in C$ restricting variable $\widehat{\beta}^{\pm}$. $\Xi'|_{\widehat{\Theta} \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)} \vdash C$ implies that $\widehat{\beta}^{\pm} \in \widehat{\Theta} \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)$.

If $\widehat{\beta}^{\pm} \in \mathsf{fav}(N) \cup \mathsf{fav}(M)$ then $[\widehat{\sigma}_1]\widehat{\beta}^{\pm} = [\widehat{\sigma}]\widehat{\beta}^{\pm}$. Additionally, $e \in C|_{\mathsf{fav}(N) \cup \mathsf{fav}(M)}$, which, since $\Xi' \vdash \widehat{\sigma} : C|_{\mathsf{fav}(N) \cup \mathsf{fav}(M)}$, means $\Xi'(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}]\widehat{\beta}^{\pm} : e$.

If $\widehat{\beta}^{\pm} \in \widehat{\Theta} \setminus (\mathsf{fav}(N) \cup \mathsf{fav}(M))$ then $[\widehat{\sigma}_1] \widehat{\beta}^{\pm} = [\widehat{\sigma}_0] \widehat{\beta}^{\pm}$. Additionally, $e \in C|_{\overrightarrow{\alpha}}^{\pm}$, which, since $\Xi' \vdash \widehat{\sigma}_0 : C|_{\overrightarrow{\alpha}}^{\pm}$, means $\Xi'(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_0] \widehat{\beta}^{\pm} : e$.

(c) Let us prove $[\sigma_0][\widehat{\sigma}]N = [\widehat{\sigma}_1][\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+]N$ by the following reasoning 7792 7793 $[\sigma_0][\widehat{\sigma}]N = [\widehat{\sigma}_0][\widehat{\sigma}|_{\rightleftharpoons}][\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+][\widehat{\sigma}]N$ 7794 by definition of σ_0 7795 $= \left[\widehat{\sigma}_{0}\right]\left[\widehat{\sigma}\right]_{\widehat{\alpha}^{+}}\left[\overrightarrow{\widehat{\alpha}^{+}}/\overrightarrow{\alpha^{+}}\right]\left[\widehat{\sigma}\right]_{fav(N)}N$ by Lemma 63 7798 $= [\widehat{\sigma}_0][\widehat{\sigma}|_{\overrightarrow{\widehat{\sigma}^+}}][\widehat{\sigma}|_{\mathsf{fav}(N)}][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N$ 7799 7800 $fav(N) \cap \overrightarrow{\alpha^+} = \emptyset$ and $\overrightarrow{\alpha^+} \cap \Theta = \emptyset$ 7801 7802 $= [\widehat{\sigma}|_{\widehat{\alpha}^{+}}][\widehat{\sigma}|_{\mathsf{fav}(N)}][\overrightarrow{\widehat{\alpha}^{+}}/\overrightarrow{\alpha^{+}}]N$ 7803 since $[\widehat{\sigma}|_{\overrightarrow{\alpha}}][\widehat{\sigma}|_{fav(N)}][\overrightarrow{\widehat{\alpha}}^+/\overrightarrow{\alpha}^+]N$ is ground 7805 $= \left[\widehat{\sigma}\right|_{\widehat{\alpha}^{+} \cup \mathsf{fav}(N)} \left[\overrightarrow{\widehat{\alpha}^{+}}/\overrightarrow{\alpha^{+}}\right] N$ 7807 $= \left[\widehat{\sigma}\right|_{\widehat{\Theta} \cup \mathsf{fav}(N)} \left[\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}\right] N$ by Lemma 63: $fav([\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+]N) = \widehat{\Theta} \cup fav(N)$ $= [\widehat{\sigma}|_{\widehat{\Theta} \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)}][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N$ 7811 also by Lemma 63 7813 $= [(\widehat{\sigma}_0 \circ \widehat{\sigma})|_{\widehat{\Theta} \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)}][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N$ $[\widehat{\sigma}|_{\widehat{\Theta} \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)}][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N$ is ground 7815 $= [\widehat{\sigma}_1][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N$ 7817 by definition of $\widehat{\sigma}_1$ 7819

- (d) $[\widehat{\sigma}]M = [\widehat{\sigma}_1]M$ By definition of $\widehat{\sigma}_1$, $[\widehat{\sigma}_1]M$ is equal to $[(\widehat{\sigma}_0 \circ \widehat{\sigma})|_{\widehat{\Theta} \cup \mathsf{fav}(N) \cup \mathsf{fav}(M)}]M$, which by Lemma 63 is equal to $[\widehat{\sigma}_0 \circ \widehat{\sigma}]M$, that is $[\widehat{\sigma}_0][\widehat{\sigma}]M$, and since $[\widehat{\sigma}]M$ is ground, $[\widehat{\sigma}_0][\widehat{\sigma}]M = [\widehat{\sigma}]M$.
- $\overrightarrow{\alpha}^+ \neq \cdot$ and $\overrightarrow{v} \neq$ hold by assumption.

Lemma 102 (*Completeness of Typing*). Suppose that $\Theta \vdash \Gamma$. For an inference tree T_1 ,

- + If T_1 infers Θ ; $\Gamma \vdash \nu$: P then Θ ; $\Gamma \vDash \nu$: nf (P)
- If T_1 infers Θ; Γ ⊢ c: N then Θ; Γ ⊨ c: nf (N)
- If T_1 infers Θ ; $\Gamma \vdash [\widehat{\sigma}] N \bullet \overrightarrow{v} \Longrightarrow M$ and
 - Θ ⊢[□] Ξ,

- (3) Θ ; dom $(\Xi) \vdash N$ (free from negative algorithmic variables, that is $\widehat{\alpha}^- \notin fav(N)$), and
- (4) $\Xi \vdash \widehat{\sigma} : fav(N)$,

then there exist M', Ξ' , and C such that

- (1) Θ ; Γ ; $\Xi \models \mathbb{N} \bullet \overrightarrow{v} \Longrightarrow M' = \Xi'$; C and
- (2) for any $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(N)$ and $\Theta \vdash M$ such that $\Theta : \Gamma \vdash [\widehat{\sigma}] N \bullet \overrightarrow{v} \implies M$, there exists $\widehat{\sigma}'$ such that
 - (a) $\Xi' \vdash \widehat{\sigma}' : fav(N) \cup fav(M')$ and $\Xi' \vdash \widehat{\sigma}' : C$,
 - (b) $\Xi \vdash \widehat{\sigma}' \simeq \widehat{\sigma} : \mathsf{fav}(N)$, and

(c) $\Theta \vdash [\widehat{\sigma}'] \underline{M}' \simeq^{\leqslant} M$.

Proof. We prove it by induction on metric (T_1) , mutually with the soundness of typing (Lemma 101). Let us consider the last rule applied to infer the derivation.

Case 1. $(\{\}^{INF})$

Then we are proving that if Θ ; $\Gamma \vdash \{c\}$: $\downarrow N$ (inferred by $(\{\}^{\text{INF}})$) then Θ ; $\Gamma \vdash \{c\}$: $nf(\downarrow N)$. By inversion of Θ ; $\Gamma \vdash \{c\}$: nf(N), we have nf(N); nf(N). It is left to notice that nf(N) = nf(n).

Case 2. (RET^{INF})

The proof is symmetric to the previous case (case 1).

Case 3. (ANN₊INF)

Then we are proving that if Θ ; $\Gamma \vdash (\nu : Q) : Q$ is inferred by (ANN_+^{INF}) then Θ ; $\Gamma \models (\nu : Q) : nf(Q)$. By inversion, we have:

- (1) $\Theta \vdash O$;
- (2) Θ ; $\Gamma \vdash \nu$: P, which by the induction hypothesis implies Θ ; $\Gamma \models \nu$: $\mathsf{nf}(P)$;
- (3) $\Theta \vdash Q \geqslant P$, and by transitivity, $\Theta \vdash Q \geqslant \mathsf{nf}(P)$; Since Q is ground, we have $\Theta : \vdash Q$ and $\Theta \vdash [\cdot] Q \geqslant \mathsf{nf}(P)$. Then by the completeness of subtyping (Lemma 87), we have $\Theta : \vdash Q \geqslant \mathsf{nf}(P) \dashv C$, where $\cdot \vdash C$ (implying $C = \cdot$). This way, $\Theta : \vdash Q \geqslant \mathsf{nf}(P) \dashv \cdot$.

Then we can apply (ANN_+^{INF}) to $\Theta \vdash Q$, Θ ; $\Gamma \vDash \nu$: $\mathsf{nf}(P)$ and Θ ; $\cdot \vDash Q \ge \mathsf{nf}(P) \dashv \cdot$ to infer Θ ; $\Gamma \vDash (\nu : Q)$: $\mathsf{nf}(Q)$.

Case 4. (ANN__INF)

The proof is symmetric to the previous case (case 3).

Case 5. (λ^{INF})

Then we are proving that if Θ ; $\Gamma \vdash \lambda x : P$. $c : P \to N$ is inferred by (λ^{INF}) , then Θ ; $\Gamma \vdash \lambda x : P$. $c : \text{nf}(P \to N)$.

, Vol. 1, No. 1, Article . Publication date: July 2024.

By inversion of Θ ; $\Gamma \vdash \lambda x : P \cdot c : P \to N$, we have $\Theta \vdash P$ and Θ ; $\Gamma, x : P \vdash c : N$. Then by the induction hypothesis, Θ ; $\Gamma, x : P \vdash c :$ nf (N). By (λ^{INF}) , we infer Θ ; $\Gamma \vdash \lambda x : P \cdot c :$ nf $(P \to \text{nf}(N))$. By idempotence of normalization (Lemma 46), nf $(P \to \text{nf}(N)) = \text{nf}(P \to N)$, which concludes the proof for this case.

Case 6. (Λ^{INF})

 Then we are proving that if Θ ; $\Gamma \vdash \Lambda \alpha^+$. $c \colon \forall \alpha^+$. N is inferred by (Λ^{INF}) , then Θ ; $\Gamma \vdash \Lambda \alpha^+$. $c \colon \text{nf}(\forall \alpha^+, N)$. Similar to the previous case, by inversion of Θ ; $\Gamma \vdash \Lambda \alpha^+$. $c \colon \forall \alpha^+$. N, we have Θ , α^+ ; $\Gamma \vdash c \colon N$, and then by the induction hypothesis, Θ , α^+ ; $\Gamma \vdash c \colon \text{nf}(N)$. After that, application of (Λ^{INF}) , gives as Θ ; $\Gamma \vdash \Lambda \alpha^+$. $c \colon \text{nf}(\forall \alpha^+, \text{nf}(N))$.

It is left to show that $\operatorname{nf}(\forall \alpha^+. \operatorname{nf}(N)) = \operatorname{nf}(\forall \alpha^+. N)$. Assume $N = \forall \overrightarrow{\beta^+}. M$ (where M does not start with \forall).

- Then by definition, $\operatorname{nf}(\forall \alpha^+, N) = \operatorname{nf}(\forall \alpha^+, \overrightarrow{\beta^+}, M) = \forall \overrightarrow{\gamma^+}, \operatorname{nf}(M)$, where $\operatorname{ord} \alpha^+, \overrightarrow{\beta^+} \operatorname{innf}(M) = \overrightarrow{\gamma^+}.$
- On the other hand, $\operatorname{nf}(N) = \forall \overrightarrow{\gamma^{+\prime}}$. $\operatorname{nf}(M)$, where $\operatorname{ord} \overrightarrow{\beta^{+}} \operatorname{innf}(M) = \overrightarrow{\gamma^{+\prime}}$, and thus, $\operatorname{nf}(\forall \alpha^{+}, \operatorname{nf}(N)) = \operatorname{nf}(\forall \alpha^{+}, \overrightarrow{\gamma^{+\prime}})$. $\operatorname{nf}(M) = \forall \overrightarrow{\gamma^{+\prime\prime}}$. $\operatorname{nf}(\operatorname{nf}(M)) = \forall \overrightarrow{\gamma^{+\prime\prime}}$. $\operatorname{nf}(M)$, where $\operatorname{ord} \alpha^{+}, \overrightarrow{\gamma^{+\prime}}$ in $\operatorname{nf}(\operatorname{nf}(M)) = \overrightarrow{\gamma^{+\prime\prime}}$.

It is left to show that $\overrightarrow{y}^{+}'' = \overrightarrow{y}^{+}$.

$$\overrightarrow{\gamma^{+\prime\prime}} = \operatorname{ord} \alpha^{+}, \overrightarrow{\gamma^{+\prime}} \operatorname{innf} (\operatorname{nf} (M))$$

$$= \operatorname{ord} \alpha^{+}, \overrightarrow{\gamma^{+\prime}} \operatorname{innf} (M)$$
by idempotence (Lemma 46)
$$= \operatorname{ord} \alpha^{+} \cup \overrightarrow{\beta^{+}} \cap \operatorname{fvnf} (M) \operatorname{innf} (M)$$
by definition of $\overrightarrow{\gamma^{+\prime}}$ and Lemma 35
$$= \operatorname{ord} (\alpha^{+} \cup \overrightarrow{\beta^{+}} \cap \operatorname{fvnf} (M)) \cap \operatorname{fvnf} (M) \operatorname{innf} (M)$$
by Lemma 36
$$= \operatorname{ord} (\alpha^{+} \cup \overrightarrow{\beta^{+}}) \cap \operatorname{fvnf} (M) \operatorname{innf} (M)$$
by set properties
$$= \operatorname{ord} \alpha^{+}, \overrightarrow{\beta^{+}} \operatorname{innf} (M)$$

$$= \overrightarrow{\gamma^{+}}$$

Case 7. (LET_{\exists}^{INF})

Then we are proving that if Θ ; $\Gamma \vdash let^{\exists}(\overrightarrow{\alpha}^{=}, x) = v$; c : N is inferred by (LET $_{\exists}^{INF}$), then Θ ; $\Gamma \vdash let^{\exists}(\overrightarrow{\alpha}^{=}, x) = v$; c : nf(N).

By inversion of Θ ; $\Gamma \vdash \mathsf{let}^\exists (\overrightarrow{\alpha}, x) = v$; c : N, we have

- (1) $\operatorname{nf}(\exists \overrightarrow{\alpha}^{-}. P) = \exists \overrightarrow{\alpha}^{-}. P$,
- (2) $\Theta; \Gamma \vdash \nu : \exists \overrightarrow{\alpha} \cdot P$, which by the induction hypothesis implies $\Theta; \Gamma \models \nu : \mathsf{nf}(\exists \overrightarrow{\alpha} \cdot P)$, and hence, $\Theta; \Gamma \models \nu : \exists \overrightarrow{\alpha} \cdot P$.

(3) $\Theta, \overrightarrow{\alpha}^2; \Gamma, x : P \vdash c : N$, and by the induction hypothesis, $\Theta, \overrightarrow{\alpha}^2; \Gamma, x : P \models c : \text{nf}(N)$. 7939 7940 (4) $\Theta \vdash N$. 7941 7942 This way, we can apply (LET $^{\text{INF}}_{\exists}$) to infer Θ ; $\Gamma \models \text{let}^{\exists}(\overrightarrow{\alpha}^{-}, x) = v$; c : nf(N). 7943 7944 Case 8. (\simeq^{INF}_{+}) 7945 Then we are proving that if Θ ; $\Gamma \vdash \nu : P'$ is inferred by $(\simeq_{\perp}^{\text{INF}})$, then Θ ; $\Gamma \vdash \nu : \text{nf}(P')$. By 7946 inversion, Θ ; $\Gamma \vdash \nu$: P and $\Theta \vdash P \simeq^{\leq} P'$, and the metric of the tree inferring Θ ; $\Gamma \vdash \nu$: P is less than the one inferring Θ ; $\Gamma \vdash \nu \colon P'$. Then by the induction hypothesis, Θ ; $\Gamma \vdash \nu \colon \mathsf{nf}(P)$. 7948 By Lemma 48 $\Theta \vdash P \simeq^{\leq} P'$ implies $\inf(P) = \inf(P')$, and thus, $\Theta \colon \Gamma \vDash v \colon \inf(P)$ can be 7950 rewritten to Θ ; $\Gamma \models \nu$: nf (P'). 7951 7952 Case 9. (VAR^{INF}) 7953 Then we prove that Θ ; $\Gamma \vdash x : P$ implies Θ ; $\Gamma \vdash x : \mathsf{nf}(P)$. By inversion of Θ ; $\Gamma \vdash x : P$, we 7954 have $x : P \in \Gamma$. Then (VAR^{INF}) applies to infer Θ ; $\Gamma \models x : \mathsf{nf}(P)$. Case 10. (LET^{INF}) Then we prove that $\Theta: \Gamma \vdash \text{let } x = v(\overrightarrow{v}); c: N \text{ implies } \Theta: \Gamma \vdash \text{let } x = v(\overrightarrow{v}); c: \text{ nf } (N).$ 7958 By inversion of Θ ; $\Gamma \vdash \text{let } x = v(\overrightarrow{v})$; c : N, we have (1) Θ ; $\Gamma \vdash \nu$: P, and by the induction hypothesis, Θ ; $\Gamma \vDash \nu$: $\mathsf{nf}(P)$. 7962 (2) Θ ; Γ , $x : P \vdash c : N$, and by Lemma 50, since $\Theta \vdash P \simeq^{\leq} \mathsf{nf}(P)$, we have Θ ; Γ , $x : \mathsf{nf}(P) \vdash$ c: N. Then by the induction hypothesis, $\Theta; \Gamma, x : \mathsf{nf}(P) \models c: \mathsf{nf}(N)$. Together, Θ ; $\Gamma \models \nu$: $\inf(P)$ and Θ ; Γ , $x : \inf(P) \models c$: $\inf(N)$ imply Θ ; $\Gamma \models \text{let } x = \nu(\overrightarrow{v})$; c: $\inf(N)$ 7966 by (LET INF). 7968 Case 11. (LET_CINF) Then we prove that Θ ; $\Gamma \vdash \text{let } x : P = c$; c' : N implies Θ ; $\Gamma \vdash \text{let } x : P = c$; c' : nf (N). 7970 By inversion of Θ ; $\Gamma \vdash \text{let } x : P = c$; c' : N, we have 7972 (1) $\Theta \vdash P$; 7974 (2) Θ ; $\Gamma \vdash c : M$, and by the induction hypothesis, Θ ; $\Gamma \models c : \mathsf{nf}(M)$; 7975 7976 (3) $\Theta \vdash M \leq \uparrow P$, which by Corollary 16 and Lemma 24 implies $\Theta \vdash \mathsf{nf}(M) \leq \uparrow P$, that is $\Theta \vdash [\cdot] \mathsf{nf}(M) \leq \uparrow P$. Then by the completeness of subtyping (Lemma 93), we have 7978 Θ ; $\cdot \models \mathsf{nf}(M) \leqslant \uparrow P \dashv \cdot$; 7979 7980 (4) Θ ; Γ , $x : P \vdash c' : N$, and by the induction hypothesis, Θ ; Γ , $x : P \models c' : \mathsf{nf}(N)$. 7981 7982 Together, these premises imply Θ ; $\Gamma \models \text{let } x : P = c$; c' : nf (N) by (LET_C^{INF}).

Case 12. $(LET_{:@}^{INF})$

7983

7984

7985 7986 7987 Then we prove that Θ ; $\Gamma \vdash \text{let } x : P = v(\overrightarrow{v})$; $c : N \text{ implies } \Theta$; $\Gamma \vdash \text{let } x : P = v(\overrightarrow{v})$; c : nf (N).

By inversion of Θ ; $\Gamma \vdash \text{let } x : P = v(\overrightarrow{v})$; c : N, we have

(1) $\Theta \vdash P$

- (2) Θ ; $\Gamma \vdash \nu$: $\downarrow M$ for some ground M, which by the induction hypothesis means Θ ; $\Gamma \models \nu$: $\downarrow \mathsf{nf}(M)$
- (3) Θ ; $\Gamma \vdash M \bullet \overrightarrow{v} \implies M'$. By Lemma 57, since $\Theta \vdash M \simeq^{<} \mathsf{nf}(M)$, we have Θ ; $\Gamma \vdash [\cdot] \mathsf{nf}(M) \bullet \overrightarrow{v} \implies M'$, which by the induction hypothesis means that there exist normalized M_0 , Ξ , and C_1 such that (noting that M is ground):
 - (a) Θ ; Γ ; $\cdot \models$ nf $(M) \bullet \overrightarrow{v} \implies M_0 \dashv \Xi$; C_1 , where by the soundness, Θ ; dom $(\Xi) \vdash M_0$ and $\Xi \vdash C_1$.
 - (b) for any $\Theta \vdash M''$ such that $\Theta : \Gamma \vdash \mathsf{nf}(M) \bullet \overrightarrow{v} \implies M''$ there exists $\widehat{\sigma}$ such that
 - (i) $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{M}_0), \Xi \vdash \widehat{\sigma} : C_1$, and
 - (ii) $\Theta \vdash [\widehat{\sigma}] M_0 \simeq^{\leq} M''$,

In particular, there exists $\widehat{\sigma}_0$ such that $\Xi \vdash \widehat{\sigma}_0 : \mathsf{fav}(M_0), \Xi \vdash \widehat{\sigma}_0 : C_1, \Theta \vdash [\widehat{\sigma}_0] M_0 \simeq^{\leqslant} M'$.

(4) $\Theta \vdash M' \leq \uparrow P$, and by transitivity, since $\Theta \vdash [\widehat{\sigma}_0] M_0 \simeq^{\leq} M'$, we have $\Theta \vdash [\widehat{\sigma}_0] M_0 \leq \uparrow P$.

Let us apply Lemma 93 to $\Theta \vdash [\widehat{\sigma}_0] M_0 \leqslant \uparrow P$ and obtain $\Xi \vdash C_2$ such that

- (a) Θ ; $\Xi \models [\widehat{\sigma}_0] M_0 \leq \uparrow P = C_2$ and
- (b) $\Xi \vdash \widehat{\sigma}_0 : C_2$.
- (5) Θ ; Γ , $x : P \vdash c : N$, and by the induction hypothesis, Θ ; Γ , $x : P \models c : nf(N)$.

To infer Θ ; $\Gamma \models \text{let } x : P = v(\overrightarrow{v})$; c : nf (N), we apply the corresponding algorithmic rule (LET $_{:0}^{\text{INF}}$). Let us show that the premises hold:

- (1) $\Theta \vdash P$,
- (2) Θ ; $\Gamma \models \nu$: $\inf (M)$,
- (3) Θ ; Γ ; $\cdot \models \mathsf{nf}(M) \bullet \overrightarrow{v} \Longrightarrow M_0 \dashv \Xi$; C_1 ,
- (4) Θ ; $\Xi \models M_0 \leqslant \uparrow P \exists C_2$, and
- (5) Θ ; Γ , $x : P \models c$: nf (N) hold as noted above;
- (6) $\Xi \vdash C_1 \& C_2 = C$ is defined by Lemma 91, since $\Xi \vdash \widehat{\sigma}_0 : C_1$ and $\Xi \vdash \widehat{\sigma}_0 : C_2$.

Case 13. $(LET_{@}^{INF})$

By assumption, c is let $x = v(\vec{v})$; c'. Then by inversion of Θ ; $\Gamma \vdash \text{let } x = v(\vec{v})$; c': N:

 • Θ ; $\Gamma \vdash \nu : \downarrow M$, which by the induction hypothesis means Θ ; $\Gamma \models \nu : \downarrow \mathsf{nf}(M)$;

- Θ ; $\Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$ principal. Then by Lemma 57, since $\Theta \vdash M \simeq^{\varsigma}$ nf (M), we have Θ ; $\Gamma \vdash$ nf $(M) \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$ and moreover, Θ ; $\Gamma \vdash$ nf $(M) \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$ principal: since for any inference, nf (M) can be replaced back with M, the sets of types Q' inferred for the applications Θ ; $\Gamma \vdash$ nf $(M) \bullet \overrightarrow{v} \Longrightarrow \uparrow Q'$ and Θ ; $\Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q'$ are the same. Then the induction hypothesis applied to Θ ; $\Gamma \vdash [\cdot]$ nf $(M) \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$ implies that there exist M', Ξ , and C such that (considering M is ground):
 - (1) Θ ; Γ ; $\cdot \models \mathsf{nf}(M) \bullet \overrightarrow{v} \implies M' = \Xi$; C, which, by the soundness, implies, in particular that
 - (a) Θ ; dom $(\Xi) \vdash M'$ is normalized and free of negative algorithmic variables,
 - (b) $\Xi|_{\mathsf{fav}(M')} \vdash C$, which means $\mathsf{dom}(C) \subseteq \mathsf{fav}(M')$,
 - (c) for any $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(\underline{M}')$ such that $\Xi \vdash \widehat{\sigma} : C$, we have $\Theta : \Gamma \vdash \mathsf{nf}(M) \bullet \overrightarrow{v} \Rightarrow [\widehat{\sigma}] \underline{M}'$.

and

- (2) for any $\Theta \vdash M''$ such that $\Theta ; \Gamma \vdash \mathsf{nf}(M) \bullet \overrightarrow{v} \implies M''$, (and in particular, for $\Theta \vdash \uparrow O$) there exists $\widehat{\sigma}_1$ such that
 - (a) $\Xi \vdash \widehat{\sigma}_1 : \mathsf{fav}(\underline{M}'), \Xi \vdash \widehat{\sigma}_1 : C$, and
 - (b) $\Theta \vdash [\widehat{\sigma}_1]M' \simeq^{\leqslant} M''$, and in particular, $\Theta \vdash [\widehat{\sigma}_1]M' \simeq^{\leqslant} \uparrow Q$. Since M' is normalized and free of negative algorithmic variables, it means that $M' = \uparrow P$ for some $P(\Theta; \text{dom}(\Xi) \vdash P)$ that is $\Theta \vdash [\widehat{\sigma}_1]P \simeq^{\leqslant} Q$.
- Θ ; Γ , $x : O \vdash c' : N$

To infer Θ ; $\Gamma \models \text{let } x = v(\overrightarrow{v})$; c': nf (N), let us apply the corresponding algorithmic rule $((\text{LET}_{\varnothing}^{\text{INF}}))$:

- (1) Θ ; $\Gamma \models \nu$: $\inf (M)$ holds as noted above;
- (2) Θ ; Γ ; $\cdot \models \mathsf{nf}(M) \bullet \overrightarrow{v} \Longrightarrow \uparrow P = \Xi$; C holds as noted above;
- (3) Let us show that nf(iQ) is the minimal instantiation of P w.r.t. C, in other words, P is C-minimized by $\widehat{\sigma}$ for some $\widehat{\sigma}$ and $[\widehat{\sigma}]P = nf(Q)$. By rewriting nf(Q) as $nf([\widehat{\sigma}_1]P)$, we need to show $[\widehat{\sigma}]P = nf([\widehat{\sigma}_1]P)$.

Let us apply the completeness of minimal instantiation (Lemma 95). That would give us $\widehat{\sigma} = \mathsf{nf}(\widehat{\sigma}_1)$, which would immediately imply the required equality. To do that, we need to demonstrate that $\widehat{\sigma}_1$ is the minimal instantiation of P w.r.t. C. In other words, any other substitution respecting C, instantiate P into a *supertype* of Q. To do that, we apply the principality of $Q: \Theta ; \Gamma \vdash \mathsf{nf}(M) \bullet \overrightarrow{v} \Longrightarrow \uparrow Q$ principal: which means that for any other Q' such that $\Theta ; \Gamma \vdash \mathsf{nf}(M) \bullet \overrightarrow{v} \Longrightarrow \uparrow Q'$, we have $\Theta \vdash Q' \geqslant Q$. It is left

to show that any substitution respecting C gives us Q' inferrable for the application Θ ; $\Gamma \vdash M \bullet \overrightarrow{v} \Longrightarrow \uparrow Q'$, which holds by 1c.

(4) To show fav(P) = dom(C) and C singular with $\widehat{\sigma}_0$ for some $\widehat{\sigma}_0$, we apply Lemma 99 with $\widehat{\Theta} = fav(P) = fav(M')$ (as noted above, $dom(C) \subseteq fav(M') = \widehat{\Theta}$).

Now we will show that any substitution satisfying C is equivalent to $\widehat{\sigma}_1$. As noted in 1c, for any substitution $\Xi \vdash \widehat{\sigma} : \widehat{\Theta}, \Xi \vdash \widehat{\sigma} : C$ implies $\Theta \vdash [\widehat{\sigma}] \underline{M'} \simeq^{\varsigma} \uparrow \underline{Q}$, which is rewritten as $\Theta \vdash [\widehat{\sigma}] \underline{P} \simeq^{\varsigma} \underline{Q}$. And since $\Theta \vdash [\widehat{\sigma}_1] \underline{P} \simeq^{\varsigma} \underline{Q}$, we have $\Theta \vdash [\widehat{\sigma}] \underline{P} \simeq^{\varsigma} [\widehat{\sigma}_1] \underline{P}$, which implies $\Xi \vdash \widehat{\sigma} \simeq^{\varsigma} \widehat{\sigma}_1 : \widehat{\Theta}$ by Corollary 23.

(5) Let us show Θ ; Γ , $x : [\widehat{\sigma}_0] P \models c' : \text{nf } (N)$. By the soundness of singularity (Lemma 98), we have $\Xi \vdash \widehat{\sigma}_0 : C$, which by 1c means $\Theta \vdash [\widehat{\sigma}_0] M' \simeq^{\leqslant} \uparrow Q$, that is $\Theta \vdash [\widehat{\sigma}_0] P \simeq^{\leqslant} Q$, and thus, $\Theta \vdash \Gamma$, $x : Q \simeq^{\leqslant} \Gamma$, $x : [\widehat{\sigma}_0] P$.

Then by Lemma 50, Θ ; Γ , $x : Q \vdash c' : N$ can be rewritten as Θ ; Γ , $x : [\widehat{\sigma}_0]P \vdash c' : N$. Then by the induction hypothesis applied to it, Θ ; Γ , $x : [\widehat{\sigma}_0]P \models c' : \mathsf{nf}(N)$ holds.

Case 14. $(\forall_{\bullet \Longrightarrow}^{INF})$

Since N cannot be a algorithmic variable, if $[\widehat{\sigma}]N$ starts with \forall , so does N. This way, $N = \forall \overrightarrow{\alpha}^{+}$. N_{1} . Then by assumption:

- (1) Θ ⊢[⊇] Ξ
- (2) Θ ; dom $(\Xi) \vdash \forall \alpha^{+}$. N_1 is free from negative algorithmic variables, and then Θ, α^{+} ; dom $(\Xi) \vdash N_1$ is free from negative algorithmic variables too;
- (3) $\Xi \vdash \widehat{\sigma} : fav(N_1)$;
- (4) $\Theta \vdash M$;
- (5) Θ ; $\Gamma \vdash [\widehat{\sigma}] \forall \overrightarrow{\alpha^+}$. $N_1 \bullet \overrightarrow{v} \implies M$, that is Θ ; $\Gamma \vdash (\forall \overrightarrow{\alpha^+}, [\widehat{\sigma}] N_1) \bullet \overrightarrow{v} \implies M$. Then by inversion there exists σ such that
 - (a) $\Theta \vdash \sigma : \overrightarrow{\alpha^+}$:
 - (b) $\overrightarrow{v} \neq \text{and } \overrightarrow{\alpha^+} \neq \cdot; \text{ and }$
 - (c) $\Theta; \Gamma \vdash [\sigma][\widehat{\sigma}] N_1 \bullet \overrightarrow{v} \Longrightarrow M$. Notice that σ and $\widehat{\sigma}$ commute because the codomain of σ does not contain algorithmic variables (and thus, does not intersect with the domain of $\widehat{\sigma}$), and the codomain of $\widehat{\sigma}$ is Θ and does not intersect with $\overrightarrow{\alpha^+}$ —the domain of σ .

Let us take fresh $\overrightarrow{\widehat{\alpha}^+}$ and construct $N_0 = [\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N_1$ and $\Xi, \overrightarrow{\widehat{\alpha}^+}\{\Theta\} \vdash \widehat{\sigma}_0 : \mathsf{fav}(N_0)$ defined as

$$\begin{cases} [\widehat{\sigma}_0] \widehat{\alpha}_i^+ = [\sigma] \alpha_i^+ & \text{for } \widehat{\alpha}_i^+ \in \overrightarrow{\widehat{\alpha}}^+ \cap \text{fav}(N_0) \\ [\widehat{\sigma}_0] \widehat{\beta}^\pm = [\widehat{\sigma}] \widehat{\beta}^\pm & \text{for } \widehat{\beta}^\pm \in \text{fav}(N_1) \end{cases}$$

Then it is easy to see that $[\widehat{\sigma}_0][\overrightarrow{\widehat{\alpha}^+}/\overrightarrow{\alpha^+}]N_1 = [\sigma][\widehat{\sigma}]N_1$ because this substitution compositions coincide on $\mathsf{fav}(N_1) \cup \mathsf{fv}(N_1)$. In other words, $[\widehat{\sigma}_0]N_0 = [\sigma][\widehat{\sigma}]N_1$.

Then let us apply the induction hypothesis to Θ ; $\Gamma \vdash [\widehat{\sigma}_0] N_0 \bullet \overrightarrow{v} \implies M$ and obtain M', Ξ' , and C such that

- Θ ; Γ ; Ξ , $\overrightarrow{\alpha}^+$ { Θ } $\models N_0 \bullet \overrightarrow{v} \implies M' \dashv \Xi'$; C and
- for any Ξ , $\overrightarrow{\alpha}^+\{\Theta\} \vdash \widehat{\sigma}_0 : \text{fav}(N_0)$ and $\Theta \vdash M$ such that Θ ; $\Gamma \vdash [\widehat{\sigma}_0] N_0 \bullet \overrightarrow{v} \Rightarrow M$, there exists $\widehat{\sigma}'_0$ such that
 - (i) $\Xi' \vdash \widehat{\sigma}'_0 : fav(\underline{N}_0) \cup fav(\underline{M}'), \Xi' \vdash \widehat{\sigma}'_0 : C$,
- (ii) $\Xi, \overrightarrow{\widehat{\alpha}^+} \{\Theta\} \vdash \widehat{\sigma}'_0 \simeq^{\leqslant} \widehat{\sigma}_0 : \mathsf{fav}(N_0), \text{ and }$
- (iii) $\Theta \vdash [\widehat{\sigma}'_0] \underline{M}' \simeq^{\leqslant} \underline{M}.$

Let us take M', Ξ' , and C from the induction hypothesis (5c) (from C we subtract entries restricting $\overrightarrow{\alpha}^+$) and show they satisfy the required properties

- (1) To infer Θ ; Γ ; $\Xi \models \forall \overrightarrow{\alpha^+}$. $N_1 \bullet \overrightarrow{v} \implies M' = \Xi'$; $C \setminus \overrightarrow{\alpha^+}$ we apply the corresponding algorithmic rule (\forall^{INF}) . As noted above, the required premises hold:
 - (a) $\overrightarrow{v} \neq \overrightarrow{\alpha^+} \neq \cdot$; and

8135

8136

8140

8144

8150

8170

8172

8174

8175 8176

8178 8179

- (b) Θ ; Γ ; Ξ , $\overrightarrow{\alpha}^+$ $\{\Theta\} \models [\overrightarrow{\alpha}^+/\overrightarrow{\alpha}^+] N_1 \bullet \overrightarrow{v} \implies M' \dashv \Xi'$; C is obtained by unfolding the definition of N_0 in Θ ; Γ ; Ξ , $\overrightarrow{\alpha}^+$ $\{\Theta\} \models N_0 \bullet \overrightarrow{v} \implies M' \dashv \Xi'$; C (5c).
- (2) Let us take and arbitrary $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(N_1)$ and $\Theta \vdash M$ and assume $\Theta ; \Gamma \vdash [\widehat{\sigma}] \forall \overrightarrow{\alpha^+}. N_1 \bullet \overrightarrow{v} \implies M$. Then the same reasoning as in 5c applies. In particular, we construct $\Xi, \overrightarrow{\alpha^+} \{\Theta\} \vdash \widehat{\sigma}_0 : \mathsf{fav}(N_0)$ as an extension of $\widehat{\sigma}$ and obtain $\Theta ; \Gamma \vdash [\widehat{\sigma}_0] N_0 \bullet \overrightarrow{v} \implies M$.

It means we can apply the property inferred from the induction hypothesis (5c) to obtain $\hat{\sigma}'_0$ such that

- (a) $\Xi' \vdash \widehat{\sigma}'_0 : \mathsf{fav}(\underline{N}_0) \cup \mathsf{fav}(\underline{M}') \text{ and } \Xi' \vdash \widehat{\sigma}'_0 : C$,
- (b) $\Xi, \overrightarrow{\widehat{\alpha}^{+}} \{\Theta\} \vdash \widehat{\sigma}'_{0} \simeq^{\leqslant} \widehat{\sigma}_{0} : \mathsf{fav}(N_{0}), \text{ and }$
- (c) $\Theta \vdash [\widehat{\sigma}'_0] \underline{M}' \simeq^{\leqslant} M$.

Let us show that $\widehat{\sigma}'_0|_{(fav(N_1)\cup fav(M'))}$ satisfies the required properties.

- (b) $\Theta \vdash [\widehat{\sigma}'_0]M' \simeq^{\leqslant} M$ holds as shown, and hence it holds for $\widehat{\sigma}'_0|_{(\mathsf{fav}(N_1) \cup \mathsf{fav}(M'))}$;
- (c) We show $\Xi \vdash \widehat{\sigma}_0' \simeq^{\varsigma} \widehat{\sigma} : \mathsf{fav}(N_1)$, from which it follows that it holds for $\widehat{\sigma}_0'|_{(\mathsf{fav}(N_1) \cup \mathsf{fav}(M'))}$. Let us take an arbitrary $\widehat{\beta}^{\pm} \in \mathsf{dom}\,(\Xi) \subseteq \mathsf{dom}\,(\Xi) \cup \overrightarrow{\alpha^{+}}$. Then since $\Xi, \overrightarrow{\alpha^{+}} \{\Theta\} \vdash \widehat{\sigma}_0' \simeq^{\varsigma} \widehat{\sigma}_0 : \mathsf{fav}(N_0)$, we have $\Xi(\widehat{\beta}^{\pm}) \vdash [\widehat{\sigma}_0'] \widehat{\beta}^{\pm} \simeq^{\varsigma} [\widehat{\sigma}_0] \widehat{\beta}^{\pm}$ and by definition of $\widehat{\sigma}_0$, $[\widehat{\sigma}_0] \widehat{\beta}^{\pm} = [\widehat{\sigma}] \widehat{\beta}^{\pm}$.

Case 15. $(\rightarrow_{\bullet \Rightarrow}^{INF})$

Since N cannot be a algorithmic variable, if the shape of $[\widehat{\sigma}]N$ is an arrow, so is the shape of N. This way, $N = Q \to N_1$. Then by assumption:

- (1) $\Theta \vdash^{\supseteq} \Xi$;
- (2) Θ ; dom $(\Xi) \vdash Q \rightarrow N_1$ is free from negative algorithmic variables;
- (3) $\Xi \vdash \widehat{\sigma} : fav(\bigcirc) \cup fav(N_1);$
- (4) $\Theta \vdash M$;
- (5) Θ ; $\Gamma \vdash [\widehat{\sigma}](Q \to N_1) \bullet v$, $\overrightarrow{v} \Longrightarrow M$, that is Θ ; $\Gamma \vdash ([\widehat{\sigma}]Q \to [\widehat{\sigma}]N_1) \bullet v$, $\overrightarrow{v} \Longrightarrow M$, and by inversion:
 - (a) Θ ; $\Gamma \vdash \nu$: P, and by the induction hypothesis, Θ ; $\Gamma \models \nu$: $\mathsf{nf}(P)$;
 - (b) $\Theta \vdash [\widehat{\sigma}] \ Q \geqslant P$, which by transitivity (Lemma 24) means $\Theta \vdash [\widehat{\sigma}] \ Q \geqslant \mathsf{nf}(P)$, and then by completeness of subtyping (Lemma 87), Θ ; $\Xi \models Q \geqslant \mathsf{nf}(P) = C_1$, for some $\Xi \vdash C_1$: fav(Q), and moreover, $\Xi \vdash \widehat{\sigma} : C_1$;
 - (c) Θ ; $\Gamma \vdash [\widehat{\sigma}] N_1 \bullet \overrightarrow{v} \Rightarrow M$. Notice that the induction hypothesis applies to this case: Θ ; dom $(\Xi) \vdash N_1$ is free from negative algorithmic variables because so is $Q \rightarrow N_1$. This way, there exist M', Ξ' , and C_2 such that
 - (i) Θ ; Γ ; $\Xi \models N_1 \bullet \overrightarrow{v} \implies M' = \Xi'$; C_2 and then by the soundness of typing (i.e. the induction hypothesis),
 - (A) $\Xi \subseteq \Xi'$
 - (B) Θ ; dom $(\Xi') \vdash M'$
 - (C) $dom(\Xi) \cap fav(\underline{M}') \subseteq fav(\underline{N}_1)$
 - (D) $\Xi'|_{\mathsf{fav}(N_1)\cup\mathsf{fav}(M')} \vdash C_2$
 - (ii) for any $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(N_1)$ and $\Theta \vdash M$ such that $\Theta : \Gamma \vdash [\widehat{\sigma}] N_1 \bullet \overrightarrow{v} \implies M$, there exists $\widehat{\sigma}'$ such that
 - (A) $\Xi' \vdash \widehat{\sigma}' : fav(N_1) \cup fav(M')$ and $\Xi' \vdash \widehat{\sigma}' : C_2$,
 - (B) $\Xi \vdash \widehat{\sigma}' \simeq \widehat{\sigma} : fav(N_1)$, and

(C) $\Theta \vdash [\widehat{\sigma}'] \underline{M}' \simeq^{\leqslant} M$.

We need to show that there exist M', Ξ' , and C such that Θ ; Γ ; $\Xi \models Q \rightarrow N_1 \bullet v$, $\overrightarrow{v} \Rightarrow M' = \Xi'$; C and the initiality property holds. We take M' and Ξ' from the induction hypothesis (5c), and C as a merge of C_1 and C_2 . To show that $\Xi' \vdash C_1 \& C_2 = C$ exists, we apply Lemma 91. To do so, we need to provide a substitution satisfying both C_1 and C_2 .

Notice that $dom(C_1) = fav(Q)$ and $dom(C_2) \subseteq fav(N_1) \cup fav(M')$. This way, it suffices to construct $\Xi' \vdash \widehat{\sigma}'' : fav(Q) \cup fav(N_1) \cup fav(M')$ such that $\Xi' \vdash \widehat{\sigma}'' : C_1$ and $\Xi' \vdash \widehat{\sigma}'' : C_2$.

By the induction hypothesis (5(c)ii), $\widehat{\sigma}|_{fav(N_1)}$ can be extended to $\widehat{\sigma}'$ such that

- (1) $\Xi' \vdash \widehat{\sigma}' : fav(N_1) \cup fav(M')$ and $\Xi' \vdash \widehat{\sigma}' : C_2$,
- (2) $\Xi \vdash \widehat{\sigma}' \simeq^{\leq} \widehat{\sigma} : \text{fav}(N_1), \text{ and }$
- (3) $\Theta \vdash [\widehat{\sigma}'] \underline{M}' \simeq^{\leq} \underline{M}$.

Let us extend $\widehat{\sigma}'$ to $\widehat{\sigma}''$ defined on fav $(Q) \cup$ fav $(N_1) \cup$ fav(M') with values of $\widehat{\sigma}$ as follows:

$$\begin{cases} [\widehat{\sigma}''] \widehat{\beta}^{\pm} = [\widehat{\sigma}'] \widehat{\beta}^{\pm} & \text{for } \widehat{\beta}^{\pm} \in \text{fav}(N_1) \cup \text{fav}(M') \\ [\widehat{\sigma}''] \widehat{\gamma}^{\pm} = [\widehat{\sigma}] \widehat{\gamma}^{\pm} & \text{for } \widehat{\gamma}^{\pm} \in \text{fav}(\begin{subarray}{c} Q \end{pmatrix} \backslash \left(\text{fav}(N_1) \cup \text{fav}(M')\right) \end{cases}$$

First, notice that $\Xi' \vdash \widehat{\sigma}'' \simeq^{\leqslant} \widehat{\sigma}' : \mathsf{fav}(N_1) \cup \mathsf{fav}(M')$ by definition. Then since $\Xi' \vdash \widehat{\sigma}' : C_2$ and $\Xi' \vdash C_2 : \mathsf{fav}(N_1) \cup \mathsf{fav}(M')$, we have $\Xi' \vdash \widehat{\sigma}'' : C_2$.

Second, notice that $\Xi \vdash \widehat{\sigma}'' \simeq^{\leq} \widehat{\sigma} : \mathsf{fav}(N_1) \cup \mathsf{fav}(O)$:

- if $\widehat{\gamma}^{\pm} \in \mathsf{fav}(\underline{Q}) \setminus (\mathsf{fav}(\underline{N}_1) \cup \mathsf{fav}(\underline{M}'))$ then $[\widehat{\sigma}'']\widehat{\gamma}^{\pm} = [\widehat{\sigma}]\widehat{\gamma}^{\pm}$ by definition of $\widehat{\sigma}''$;
- if $\widehat{\gamma}^{\pm} \in \text{fav}(\underline{\mathcal{Q}}) \cap \text{fav}(\underline{N}_1)$ then $[\widehat{\sigma}'']\widehat{\gamma}^{\pm} = [\widehat{\sigma}']\widehat{\gamma}^{\pm}$, and $\Xi \vdash \widehat{\sigma}' \simeq^{\leqslant} \widehat{\sigma} : \text{fav}(\underline{N}_1)$, as noted above;
- if $\widehat{\gamma}^{\pm} \in \mathsf{fav}(\underline{\mathcal{Q}}) \cap \mathsf{fav}(\underline{M'})$ then since Θ ; $\mathsf{dom}(\Xi) \vdash \underline{\mathcal{Q}}$, we have $\mathsf{fav}(\underline{\mathcal{Q}}) \subseteq \mathsf{dom}(\Xi)$, implying $\widehat{\gamma}^{\pm} \in \mathsf{dom}(\Xi) \cap \mathsf{fav}(\underline{M'}) \subseteq \mathsf{fav}(\underline{N}_1)$. This way, $\widehat{\gamma}^{\pm} \in \mathsf{fav}(\underline{\mathcal{Q}}) \cap \mathsf{fav}(\underline{N}_1)$, and this case is covered by the previous one.

In particular, $\Xi \vdash \widehat{\sigma}'' \simeq^{\leqslant} \widehat{\sigma} : \mathsf{fav}(\underline{\mathcal{Q}})$. Then since $\Xi \vdash \widehat{\sigma} : C_1$ and $\Xi \vdash C_1 : \mathsf{fav}(\underline{\mathcal{Q}})$, we have $\Xi \vdash \widehat{\sigma}'' : C_1$.

This way, $\widehat{\sigma}'$ satisfies both C_1 and C_2 , and by the completeness of constraint merge (Lemma 91), $\Xi' \vdash C_1 \& C_2 = C$ exists.

Finally, to show the required properties, we take M' and Ξ' from the induction hypothesis (5(c)ii), and C defined above. Then

- (1) Θ ; Γ ; $\Xi \models Q \rightarrow N_1 \bullet v$, $\overrightarrow{v} \implies M' = \Xi'$; C is inferred by $(\longrightarrow_{\bullet \Longrightarrow}^{INF})$. As noted above:
 - (a) Θ ; $\Gamma \models \nu$: nf (P),

(b) Θ ; $\Xi \models \mathbb{Q} \geqslant \mathsf{nf}(P) \dashv C_1$,

(c) Θ ; Γ ; $\Xi \models N_1 \bullet \overrightarrow{v} \Longrightarrow M' \dashv \Xi'$; C_2 , and

(d) $\Xi' \vdash C_1 \& C_2 = C$.

(2) let us take an arbitrary $\Xi \vdash \widehat{\sigma}_0 : \mathsf{fav}(\cite{Q}) \cup \mathsf{fav}(\cite{N}_1);$ and $\Theta \vdash M_0$; such that $\Theta ; \Gamma \vdash [\widehat{\sigma}_0](\cite{Q} \to \cite{N}_1) \bullet \nu, \cite{v} \Rightarrow M_0$. Then by inversion of $\Theta ; \Gamma \vdash [\widehat{\sigma}_0] \cite{Q} \to [\widehat{\sigma}_0] \cite{N}_1 \bullet \nu, \cite{v} \Rightarrow M_0$, we have the same properties as in 5. In particular,

• $\Theta \vdash [\widehat{\sigma}_0] Q \ge \mathsf{nf}(P)$ and by the completeness of subtyping (Lemma 87), $\Xi \vdash \widehat{\sigma}_0 : C_1$.

• Θ ; $\Gamma \vdash [\widehat{\sigma}_0] N_1 \bullet \overrightarrow{v} \implies M_0$. Then by 5(c)ii, there exists $\widehat{\sigma}'_0$ such that

0 + 0, $1 + [0] + 1 + 0 \longrightarrow M_0$. Then by 3(c), there exists 0 such

 (a) $\Xi' \vdash \widehat{\sigma}'_0 : \mathsf{fav}(N_1) \cup \mathsf{fav}(M') \text{ and } \Xi' \vdash \widehat{\sigma}'_0 : C_2,$

(b) $\Xi \vdash \widehat{\sigma}'_0 \simeq^{\leqslant} \widehat{\sigma}_0 : \mathsf{fav}(\underline{N}_1)$, and

(c) $\Theta \vdash [\widehat{\sigma}'_0] M' \simeq^{\leq} M_0$.

Let us extend $\widehat{\sigma}'_0$ to be defined on $\mathsf{fav}(\underline{\mathcal{Q}}) \cup \mathsf{fav}(\underline{N}_1) \cup \mathsf{fav}(\underline{M}')$ with the values of $\widehat{\sigma}_0$. We define $\widehat{\sigma}''_0$ as follows:

$$\begin{cases} [\widehat{\sigma}_0^{\prime\prime}]\widehat{\gamma}^{\pm} = [\widehat{\sigma}_0^{\prime}]\widehat{\gamma}^{\pm} & \text{for } \widehat{\gamma}^{\pm} \in \text{fav}(N_1) \cup \text{fav}(M^{\prime}) \\ [\widehat{\sigma}_0^{\prime\prime}]\widehat{\gamma}^{\pm} = [\widehat{\sigma}_0]\widehat{\gamma}^{\pm} & \text{for } \widehat{\gamma}^{\pm} \in \text{fav}(Q) \setminus (\text{fav}(N_1) \cup \text{fav}(M^{\prime})) \end{cases}$$

This way,

 • $\Xi' \vdash \widehat{\sigma}_0'' : \mathsf{fav}(\underline{Q}) \cup \mathsf{fav}(\underline{N}_1) \cup \mathsf{fav}(\underline{M}'),$

 • $\Xi' \vdash \widehat{\sigma}_0'' : C$, since $\Xi' \vdash \widehat{\sigma}_0'' : C_1$ and $\Xi' \vdash \widehat{\sigma}_0'' : C_2$, which is proved similarly to $\Xi' \vdash \widehat{\sigma}'' : C_1$ and $\Xi' \vdash \widehat{\sigma}'' : C_2$ above;

 • $\Xi \vdash \widehat{\sigma}_0'' \simeq^{\leqslant} \widehat{\sigma}_0 : \mathsf{fav}(N_1) \cup \mathsf{fav}(Q)$: the proof is analogous to $\Xi \vdash \widehat{\sigma}'' \simeq^{\leqslant} \widehat{\sigma} : \mathsf{fav}(N_1) \cup \mathsf{fav}(Q)$ above.

• $\Theta \vdash [\widehat{\sigma}_0'']M' \simeq^{\leqslant} M_0$ Notice that $\Xi' \vdash \widehat{\sigma}_0'' \simeq^{\leqslant} \widehat{\sigma}_0' : \mathsf{fav}(N_1) \cup \mathsf{fav}(M')$, which is proved analogously to $\Xi' \vdash \widehat{\sigma}'' \simeq^{\leqslant} \widehat{\sigma}' : \mathsf{fav}(N_1) \cup \mathsf{fav}(M')$ above. Then $\Theta \vdash [\widehat{\sigma}_0']M' \simeq^{\leqslant} M_0$ can be rewritten to $\Theta \vdash [\widehat{\sigma}_0'']M' \simeq^{\leqslant} M_0$.

Case 16. $(\emptyset_{\bullet \Rightarrow}^{INF})$

By assumption:

(1) Θ ⊦[⊇] Ξ,

(2) $\Theta \vdash N'$,

(3) Θ ; dom $(\Xi) \vdash N$ and N is free from negative variables,

(4) $\Xi \vdash \widehat{\sigma} : \mathsf{fav}(N)$,

(5) Θ ; $\Gamma \vdash [\widehat{\sigma}] N \bullet \implies N'$, and by inversion, $\Theta \vdash [\widehat{\sigma}] N \simeq^{\leqslant} N'$.

Then we can apply the corresponding algorithmic rule $(\emptyset_{\bullet \Longrightarrow}^{\text{INF}})$ to infer Θ ; Γ ; $\Xi \models N \bullet \Longrightarrow$ nf $(N) \dashv \Xi$; . Let us show the required properties. Let us take an arbitrary $\Xi \vdash \widehat{\sigma}_0$: fav(N) and $\Theta \vdash M$ such that Θ ; $\Gamma \vdash [\widehat{\sigma}_1] N \bullet \Longrightarrow M$. Then we can take $\widehat{\sigma}_0$ as the required substitution:

- (1) $\Xi \vdash \widehat{\sigma}_0 : \mathsf{fav}(N) \cup \mathsf{fav}(\mathsf{nf}(N)), \text{ since } \mathsf{fav}(\mathsf{nf}(N)) = \mathsf{fav}(N), \text{ and thus, } \mathsf{fav}(N) \cup \mathsf{fav}(\mathsf{nf}(N)) = \mathsf{fav}(N);$
- (2) $\Xi \vdash \widehat{\sigma}_0 : \cdot \text{ vacuously};$
- (3) $\Xi \vdash \widehat{\sigma}_0 \simeq^{\leqslant} \widehat{\sigma}_0 : \text{fav}(N)$ by reflexivity;
- (4) Let us show $\Theta \vdash [\widehat{\sigma}_0] \mathsf{nf}(N) \simeq^{\leqslant} M$. Notice that $\Theta ; \Gamma \vdash [\widehat{\sigma}_0] N \bullet \Longrightarrow M$ can only be inferred by $(\emptyset_{\bullet \Longrightarrow}^{\mathsf{INF}})$, and thus, $\Theta \vdash [\widehat{\sigma}_0] N \simeq^{\leqslant} M$. By Corollary 17, $\Theta \vdash [\widehat{\sigma}_0] N \simeq^{\leqslant} [\widehat{\sigma}_0] \mathsf{nf}(N)$, and then by transitivity, $\Theta \vdash [\widehat{\sigma}_0] \mathsf{nf}(N) \simeq^{\leqslant} M$, that is $\Theta \vdash [\widehat{\sigma}_0] \mathsf{nf}(N) \simeq^{\leqslant} M$.
